OR, A

DICTIONARY

ARTS, SCIENCES,

AND

MISCELLANEOUS LITERATURE;

Constructed on a Plan,

BY WHICH

THE DIFFERENT SCIENCES AND ARTS

Are digested into the Form of Distinct

TREATISES OR SYSTEMS.

COMPREHENDING

The HISTORY, THEORY, and PRACTICE, of each, according to the Latest Discoveries and Improvements;

AND FULL EXPLANATIONS GIVEN OF THE

VARIOUS DETACHED PARTS OF KNOWLEDGE,

WHETHER RELATING TO

NATURAL and ARTIFICIAL Objects, or to Matters Ecclesiastical, Civil, Military, Commercial, &c.

Including Electrons of the most important Topics relative to Religion, Morals, Manners, and the Oeconomy of Life:

TOGETHER WITH

A DESCRIPTION of all the Countries, Cities, principal Mountains, Seas, Rivers, &c. throughout the World;

A General History, Ancient and Modern, of the different Empires, Kingdoms, and States;

An Account of the LIVES of the most Eminent Persons in every Nation, from the earliest ages down to the present times.

Compiled from the writings of the best Authors, in several languages, the most approved Distinutes, as well of general sevence as of its particular branches, the irradictions, Journals, and Memoirs, of learned Societies, both at lome and abroad; the Mr. Lectures of Eminent Professors on different sciences; and a variety of Original Materi Is, furnized by an Extensive Correspondence.

THE THIRD EDITION, IN EIGHTEEN VOLUMES, GREATLY IMPROVED.

ILLUSTRATED WITH FIVE HUNDRED AND FORTY-TWO COPPERPLATES.

(VOL. II.) AT 4 = BAR

INDOCTI DISCANT, BT AMENT MI MINISSE PERITI,

Angerma-

nia

NGERMANIA, a province of the kingdom of Sweden, bounded on the N. by Lapland and Bothnia, on the E. by the gulf of Bothnia and Medelpadia, and on the W. by Jempti and Herndel. It is full of rocks, mountains, and forests; and there is one very high mountain called Scull. It has excellent iron works, and lakes abounding with fish.

ANGERMOND, a town of the duchy of Berg, in Germany, on the E. side of the Rhine, subject to the Elector Palatine. E. Long. 6. 20. N. Lat. 51. 10.

ANGERONA, in mythology, the name of a Pagan deity whom the Romans prayed to for the cure of the quinfy; in Latin, angina. Pliny calls her the goddes of filence and calmness of mind, who banishes all uneasiness and melancholy. She is represented with her mouth covered, to denote patience and refraining from complaints. Her statue was set up, and sacrificed to, in the temple of the goddess Volupia, to show that a patient enduring of affliction leads to pleafure.

ANGERONALIA, in antiquity, folemn feasts held by the Romans the 21st of December, in honour of Angerona, or Angeronia, the goddess of patience and silence. Festus and Julius Modestus, quoted by Macrobius, Saturn. Lib. I. cap. 10. derive the name from angina, "quinfy;" and suppose the goddess to have been thus denominated, because she presided over that disease.—Others suppose it formed from angor, "grief, pain;" to intimate that she gave relief to those afflicted therewith.—Others deduce it from angeo, "I press, I close," as being reputed the goddess of silence, &c.

ANGERS, a great city of France, and capital of the duchy of Anjou, with a bishop's see. It is seated a little above the place where the Sarte and the Loire lose themselves in the Maine. This last river divides the city into two equal parts, called the High and the Low Town. There are twelve parishes in the city, and four in the fuburbs, which contain upwards of 36,000 inhabitants. Besides these, there are eight chapters, and a great number of convents for both fexes. Its greatest extent is along the declivity of a hill, which reaches quite down to the river fide. The castle was built by St Louis, about the middle of the 13th cen-The walls, fosses, and numerous towers which yet subsist, evince its former magnificence: and its situation in the centre of the city, on a rock overhanging the river, conduces to give it an air of grandeur, though at present in decay. It was the principal residence of the kings of Sicily, as dukes of Anjou, but is now in a state of total ruin. The cathedral of Angers is a venerable structure; and although it has un-Vol. II. Part I.

ANG

dergone many alterations in the course of ages since its construction, yet the architecture is singular, and deserves attention. Here lies interred with her ancestors the renowned Margaret, daughter of René king of Sicily, and queen of Henry VI. of England. She expired, after her many intrepid, but ineffectual, efforts, to replace her husband on the throne, in the year 1482, at the castle of Dampierre in Anjou. Near the church of St Michael is the handsomest square in the city, from whence runs a street which has the name of the church. On one fide of this street is the town-house; which has a fine tower, with a clock, raifed upon an arch, which ferves for a passage into the great square. There are two large bridges, which keep up a communication between the two parts of the city; and in the leffer of these there is another square, which serves for a market. The university of Angers was founded in 1398, and the academy of belles letters in 1685. This last consists of thirty academicians. At the end of the suburb of Bresigny are the quarries of Angers, so famous for the fine flate which is got from thence. The pieces are of the thickness of a crown piece, and a foot square. All the houses in Angers are covered with this slate, which has gained it the appellation of the Black City. The walls with which King John of England furrounded it in 1214 remain nearly entire, and are of very great circumference. W. Long. o. 30. N. Lat. 47. 28.

ANGHIERA, a town of Italy, in the duchy of Milan, and capital of a county of the fame name. It is feated on the castern side of the lake Maggiore, in E. Long. 9. 5. N. Lat. 45. 42.

ANGINA, in medicine, a violent inflammation of the throat, otherwise called quinsy. See Medicine, Index.

Angina Pelloris. See Medicine, Index.

ANGIOSPERMIA, in the Linnzan fystem of botany, the second order in the class didynamia. It consists of those plants, of that class, whose seeds are enclosed in a pericarpium. In this order the stigma is generally obtuse. These are the personats of Tournefort.

ANGITIÆ LUCUS or NEMUS, (Virg.), fitnated on the west side of the Lacus Fucinus. The inhabitants are called Lucenses, by Pliny. Angitia was sister of Medea, who taught antidotes against possion and serpents, according to Sil. Italicus. But Servius on Virgil says, that the inhabitants called Medea by this name for the same reason. The town is now called Luco.

ANGLE, the inclination of two lines meeting one another in a point. See GEOMETRY.

Angers

Α

ANGLE

ANGLE of Incidence, in optics, the angle which a ray of light makes with a perpendicular to that point of the furface of any medium on which it falls; though it is fometimes understood of the angle which it makes with the furface itself.

Augus of Refraction now generally means the angle which a ray of light, refracted by any medium, makes with a perpendicular to that point of the furface on which it was incident; but has fometimes been underflood of the angle which it makes with the furface of the refracting medium itself.

ANGLER, a person who practises the art of angling, whether as a diversion or otherwise. See the ar-

ticle Angling.

Angler, in ichthyology, the English name of a

species of lophus. See Lornus.

ANGLES, an ancient German nation, originally a branch of the Sucvi; who, after various migrations, fettled in that part of Denmark, and duchy of Slefwick, which to this day is called Angel, and of which the city of Flensburgh is the capital. Here they were known, even in the time of Tacitus, by the name of Angli. The origin of this name is variously accounted According to Saxo-Grammaticus, they were called Angli, from one Angulus, fon to Humblus king of Denmark. Widischind, a Saxon writer, will have them to be called Angli, from an island in the corner or angle of the fea, which they conquered. Goropius derives their name from the Saxon word Angel, or Engel, fignifying a fith-hook; the Angles, like the other Saxon nations, being greatly addicted to piracy, and on that account being fo named by the neighbouring nations; as if, like hooks, they caught all that was in the sea. To this nation the British ambassadors are faid to have applied, when foliciting fuccours against the Scots and Picts. The Angles, therefore, came over in greater numbers than any other Saxon nation; and accordingly had the honour of giving the name of Anplu to England. See ENGLAND.

ANGLESEY (1sle of) is the most western county of North Wales. It is 24 miles in length, 18 in breadth, and fends one member to parliament. It is separated from Caernarvonshire by a strait called Menai, and on every other fide is furrounded by the fea. It is a fertile fpot, and abounds in corn, cattle, fleth, fish,

and fowls.

At Port Aethwy, the most general ferry into the island, there is a great passage of cattle. It is computed that the island sends forth annually from 12,000 to 15,000 head, and multitudes of sheep and hogs. It is also computed that the remaining stock of cattle is 30,000. In 1770 upwards of 90,000 bushels of corn were exported, exclusive of wheat. The improvement in husbandry has greatly increased since the suppression of fmulgling from the ifle of Man: before that time every farmer was mounted on fome high promontory, expecting the veffel with illicit trade; but fince that period, he fets in earnest to industry and cultivation. Not but that the island was in the most remote times famous for its fertility: Mon, Mam Gymry, the Nurfing mother of Wales, was a title it assumed even in the 12th century.

This island is divided into 74 parishes, of which most of the churches are situated near the shores. By an account given on the 13th of August 1563, there were 2010 households, or families, in Angle- Angel fey; allowing five to a family, the whole number of inhabitants in that period was 10,050. In 1776, the number of houses in Anglesey was about 3956: allowing five persons to a family, the whole number of inhabitants was at that time 19,780; which wants only 340 of doubling the number of inhabitants in the intervening space. The chief town is BEAUMARIS.

In ancient times this island was called Mon, Mona or Money. It was the great nursery of the religion of the Druids; being the refidence of the grand druid, or chief pontiff, and confequently of all the learned

doctors in that religion.

Many ancient monuments of druidifm still remain in the island .- At Tre'r Dryw, or the habitation of the arch druid, are feveral mutilated remains, which have been described by Mr Rowlands. His Bryn Gwyn, or Brein Gwyn, or royal tribunal, is a circular hollow of 180 feet in diameter, furrounded by an immense aggerof earth and stones, evidently brought from some other place, there not being any mark of their being taken from the spot. It has only a single entrance. This is fupposed to have been the grand confistory of the druidical administration .- Not far from it was one of the Gorfeddau, now in a manner dispersed, but which once confifted of a great copped heap of stones, on which fat aloft a druid, instructing the surrounding people multa de Deorum immortalium vi et potestate disputare, et juventuti tradunt; C. Lib. 6 .- Here were also the relicks of a circle of flones, with the crowlech in the midfl; but all extremely imperfect. Two of the stones are very large; one, which ferves at prefent as part of the end of a house, is 12 feet 7 inches high, and 8 feet broad; and another 11 feet high, and 23 feet in girth. Some lefter stones yet remain. This circle, when complete, was one of the temples of the druids, in which their religious rites were performed. It is the conjecture of Mr Rowlands, that the whole of these remains were furrounded with a circle of oaks, and formed a deep and facred grove: Jam per se roborum clegunt lucos, neque ulla sacra sine ea fronde conficiunt; (Plin. Hift. Nat. xv. 44.)-Near this is Caer Leb, or the moated entrenchment; of a fquare form, with a double rampart, and broad ditch intervening, and a leffer on the outside. Within are foundations of circular and of fquare buildings. This Mr Rowland supposes to have been the refidence of the arch druid, and to have given the name, Tre'r Dryw, to the township in which it stands. At Trev Wry are several faint traces of circles of stones, and other vestiges of buildings; but all fo dilapidated, or hid in weeds, as to become almost formless. Bod-druddn, or the habitation of the druids, Tre'r-Beirdd, or that of the bard, and Bodowyr, or that of the priests, are all of them hamlets, nearly furrounding the feat of the chief druid, composing the effential part of his fuite. At the last is a thick cromlech, resting on three stones.

The shore near Porthamel, not far from hence, is famed for being the place where Suctonius landed, and put an end in this itland to the druid reign. His infantry passed over in slat-bottomed boats, perhaps at the fpot still called Pant yr Yscrapbie, or the valley of Skiffs. His cavalry croffed partly by fording, partly by swimming. Of the conslict on this occasion we have the following animated description by Tacitus *; Annal.xiv.

"Stat pro littore diverfa acies, denfa armis virifque, intercurfantibus forminis in modum furiarum, veste ferali, crinibus dejectis, faces perferebant; druidaque circum, preces diras sublatis ad cœlum manibus fundentes. Novitate aspectus percutere militem, ut quasi hærentibus membris, immobile corpus vulneribus præberent. Dein cohortationibus ducis, et se ipse stimulantes, ne muliebre et fanaticum agmen pavescerent, inferunt figna, sternuntque obvios et igni suo involvunt. Præsidium posthac impositum vicis, excisique luci, sævis superstitionibus facri. Nameruore captivo adolere aras, et hominum fibris consulere deos fas habebant."-Thus Englished: "On the shore stood a motley army in close array, and well armed; with women running wildly about in black attire with dishevelled hair, and like the furies brandishing their torches; furrounded by the druids, lifting up their hands to heaven, and pouring forth the most dreadful imprecations. The foldier flood astonished with the novelty of the fight. His limbs grew torpid, and his body remaining motionless refigned to every wound. At length, animated by their leader, and roufing one another not to be intimidated with a womanly and fanatic hand, they difplayed their enfigns, overthrew all who opposed them, and flung them into their own fires." After the battle, they placed garrifons in the towns, and cut down the groves confecrated to the most horrible superstitions: for the Britons held it right to facrifice on their altars with the blood of their captives, and to confult the gods by the inspection of human entrails."-There are no traces of any Roman works left in this country.

Near the ferry of Moel y Don appear the fine woods of Sir Nicholas Bayley, fkirting the Menai for a considerable way. The wooded part of the island is on this fide. It commences at Llanidan, and recals the ancient British name of Anglesey, Ynys Dywyll, or the Dark Island, on account of the deep shade of its groves: but at present it is (except in this part) entirely diveited of trees; and the climate so averse to their growth, that in most parts it is with great difficulty the gentry can raife a plantation round their houses. Plas Newydd, the feat of Sir Nicholas Bayley, lies close upon the water, protected on three fides by venerable oaks and The view up and down this magnificent riverlike strait is extremely fine. The shores are rocky; those on the opposite side covered with woods; and beyond foar a long range of Snowdonian Alps. Here flood a house built by Gwenllian, a descendant of Cadrod Hardd. The mansion has been improved, and altered to a castellated form by the present owner.

Their flay was fo flort, that they had not time to form

any thing permanent.

In the woods are some very remarkable druidical an-Behind the house are to be seen two vast tiquities. The upper stone of one is 12 feet 7 cromlechs. inches long, 12 broad, and four thick, supported by five tall stones. The other is but barely separated from the first: is almost a square, of five feet and a half, and supported by four stones. The number of supporters to cromlechs are merely accidental, and depend on the fize or form of the incumbent stone. These are the most magnificent we have, and the highest from the ground; for a middle-fized horse may easily pass under the largest. In the lands of Llugwy, indeed, there is a most stupendous one of a rhomboidal form.

The greatest diagonal is 17% feet, the lesser is, and the Angles thickness three feet nine inches; but its height from the ground is only two feet: it was supported by several flones. The Welfh, who afcribe every thing flupendous to our famous British king, call it Arthur's Quoit. In the woods at this place are some druidical circles nearly contiguous to each other.

At a small distance from Beaumaris, on the shore, fland the remains of Llanvaes, or the Friars. It was founded by Prince Llewelyn ap Jerwerth, and according to the general tradition of the country, over the grave of his wife Joan, daughter of King John, who died in 1237, and was interred on the spot. Here also were interred a fon of a Danish king, Lord Clifford, and many barons and knights who fell in the Welsh wars. It was dedicated to St Francis, and confecrated by Howel bishop of Bangor, a prelate who died in 1240. The religious were Franciscans, or minor friars. Their church and house were destroyed, and their lands wasted, in the insurrection made soon after the death of Llewelyn, last Welsh prince, by his relation Madoc. Edward II. in confideration of their misfortunes, remitted to them the payment of the taxes due to him, which before the war were levied at the rate of 121. 10s. These friars were strong favourers of Owen Glendwr. Henry IV. in his first march against Owen, plundered the convent, put several of the friers to the sword, and carried away the reft; but afterwards fet them at liberty, made reflitution to the place, but peopled it with English recluses. It possibly was again reduced to run: for Henry V. by patent, establishes here eight friars, but directs that two only flould be Welth. At the diffolution, Henry VIII. fold the convent and its possessions to one of his courtiers. They became in later days the property of a family of the name of White (now extinct), who built here a good manfion. It of late became, by purchase, the property of Lord Bulkeley. The church is turned into a barn, and the coffin of the princess Joan now serves for a watering trough.-A little farther is Castell Aber Lhenawg, a fmall fquare fort, with the remains of a little round tower at each corner. In the middle one flood a fquare tower. A fosse surrounds the whole. A hollow way is carried quite to the shore, and at its extremity is a large mound of earth, defigned to cover the landing. This caftle was founded by Hugh Lupus earl of Chester, and Hugh the Red carl of Shrewsbury, in 1098, when they made an invation, and committed more favage barbarities on the poor natives, especially on one Kenred a priest, than ever stained the annals of any country. Providence fent Magnus king of Norway to revenge the cruelties. His coming was to all appearance casual. He offered to land, but was opposed by the earls. Magnus stood in the prow of his fhip, and calling to him a most expert bowman, they at once directed their arrows at the earl of Shrewfbury, who flood all armed on the shore. An arrow pierced his brain through one of his eyes, the only defenceless part. The victor, seeing him spring up in the agonies of death, infultingly cried out in his own language, Leit loupe, " Let him dance." This fort was garrifoned fo lately as the time of Charles I. when it was kept for the parliament by Sir Thomas Cheadle; but was taken by Colonel Robinson in 1645.

Above Llanddona is a high hill, called Burned Arthur.

facey. thur, or Arthur's round table: the true name was probably Din, or Dinas Sulwy: for a church immediately beneath bears that of Llanvihangle Din-Sulwy. On the top of it is a great British post, surrounded by a double row of rude stones with their sharp points uppermost; and in some parts the ramparts are formed of fmall stones. In the area are vestiges of oval buildings; the largest is formed with two rows of flat stones set on end. These had been the temporary habitations of the possessors. It had been a place of vast strength: for, besides the artificial defence, the hill slopes steeply on all fides, and the brink next to the ramparts is mostly precipitous. It is worth while to ascend this hill for the fake of the vast prospect; and intermixture of sea,

rock, and alps, most savagely great.

About two miles south of Plas Gwyn, the seat of Paul Panton, Elq; was situated Penmynnydd, once the residence of the ancestors of Owen Tudor, second husband to Catherine of France, queen dowager of Henry V.; "who beyng (as honest Halle informs us) young and luftye, following more her owne appetyte than frendely confaill, and regardyng more her private affection than her open honour, toke to husband privily (in 1428) a goodly gentylman, and a beautiful person, garniged with manye godly gyftes both of nature and of grace, called Owen Teuther, a man brought forth and come of the noble lignage and auncient lyne of Cadwaladar, the last kynge of the Britonnes." The match, important in its confequences, restored the British races of princes to this kingdom: These reigned long, under the title of the House of Tudor; the mixed race having ceased on the accession of Henry VII. grandfon to our illustrious countryman. The remains of the residence of the Tudors are, the door of the gateway: part of the house, and the great chimneypiece of the hall, are to be feen in the present farmhouse. Some coats of arms, and dates of the building or time of repairs, are to be feen, with the initial letters of the names of the owners. The Tudors, for a confiderable space before the extinction of their race, assumed the name of Owen. Richard was the last male of the family, and was sheriff of the county in 1657. Margaret, heires of the house, married Coningsby Williams, Esq; of Glan y gors, in this island, who possessed it during his life. It was afterwards fold to Lord Bulkeley, in whose descendant it still continues. In the church of Penmynndydd is a most magnificent monument of white alabatter, removed at the dissolution from the abbey of Llanvaes to this place; probably crested in memory of one of the House of Tudor, who had been interred there. On it is the figure of a man in complete armour, a conic helm, and mail guard down to his breaft; his lady is in a thick angular hood; their feet rest on lions, and their heads are imported by angels.

On the western point of the bay is a small cape, flat at top, called Cuffell mawr, joined to the land by a low ishmus. It is composed of limestone, which is carried to distant parts in small vessels, which lie in a fmall channel near the rock, and by their numbers frequently enliven the view. Roman coins have been found in this neighbourhood; but there are no veftiges of there having been any station. Beyond Castlemawr, on the shore, are vast blocks of black marble filled with thells, corolloids, and fungitæ.

At Trysclwyn mountain is the most considerable Angular body of copper ore perhaps ever known. The part of Trysclwyn which contains it is called Parys mountain. Of this mountain, and the works there carried on, we have the following very curious and particular account by Mr Pennant *:- " The external aspect of the hill +. Tour in is extremely rude, and rifes into enormous rocks of Wales, II. coarfe white quartz. The ore is lodged in a bason, or 263. hollow, and has on one fide a small lake, on whose waters, distasteful as those of Avernus, no bird is known to alight. The whole aspect of this tract has, by the mineral operations, assumed a most savage appearance. Suffocating fumes of the burning heaps of copper arife in all parts, and extend their baneful influence for miles round. In the adjacent parts vegetation is nearly destroyed: even the mosses and lichens of the rocks have perished; and nothing seems capable of resisting the fumes but the purple melic grass, which flourishes in abundance. It is thought that the ore had been worked in a very distant period. Vestiges of the ancient operations appear in feveral parts, carried on by trenching, and by heating the rocks intenfely, then fuddenly pouring on water, so as to cause them to crack or scale; thus awkwardly supplying the use of gunpowder. Pieces of charcoal were also found, which proves that wood was made use of for that purpose. As the Britons imported all works in brafs, it is certain that the Romans were the undertakers of these mines; and it is very probable that they fent the ore to Caerhen to be imelted, the place where the famous cake of copper was discovered. They might likewise have had a smelting hearth in this island; for a round cake of copper was discovered at Llanvaethlle, a few miles from this place. Its weight was fifty pounds, and it had on it a mark refembling an L.

"In the year 1762, one Alexander Frazier came into Anglesey in search of mines. He visited Parys mountain; called on Sir Nicholas Bayley, and gave him so flattering an account of the prospect, as induced him to make a trial, and fink shafts. Ore was discovered; but before any quantity could be gotten, the mines were overpowered with water. In about two years after, Mesirs. Roe and Co. of Macclessield applied to Sir Nicholas for a leafe of Penrhyn ddu mine in Caernarvonshire; with which they were, much against their wills, compelled to take a lease of part of this mountain, and to carry on a level, and make a fair trial. The trial was accordingly made; ore was difcovered; but the expences overbalanced the profits. They continued working to great loss; and at length determined to give the affair up. They gave their agent orders for that purpose: but he, as a final attempt, divided his men into ten several companies, of three or four in a partnership, and let them fink shafts in various places, about eight hundred yards eastward of a place called the Golden Venture, on a prefumption that a spring, which issued from near the place, must come from a body of mineral. His conjecture was right; for in less than two days they met with, at the depth of seven feet from the surface, the solid mineral, which proved to be that vast body which has since been worked to fuch advantage. The day that this difcovery was made was March 2. 1768: which has ever fince been observed as a festival by the miners. Soon after this discovery, another adventure was begun

· by the reverend Mr Edward Hughes, owner of part of the mountain, in right of his wife Mary Lewis of Llys Dulas; so that the whole of the treasure is the property of Sir Nicholas Bayley and himself. The body of copper ore is of unknown extent. The thickness has been ascertained in some places by the driving of a level under it, several years ago, and it was found to be in some places twenty-four yards. The ore is mostly of the kind called by Cronsted, Pyrites cupri flavo viridescens, and contains vast quantities of sulphur. It varies in degrees of goodness; some of it is rich, but the greater part poor in quality.

"There are other species of copper ore found here. Of late a vein of the Pyrites cupri griseus of Cronsted, about seven yards wide, has been discovered near the west end of the mountain: some is of an iron gray, fome quit black; the first contains sixteen 1b. of copper per 100lb. the last forty. An ore has been lately found, in form of loofe earth, of a dark purplish colour; and the best of it has produced better than eight in twenty. Some years ago, above thirty pounds of native copper was found in driving a level through a turbery; some was in form of moss, some in very thin leaves.

"It is quarried out of the bed in vast masses; is broken into fmall pieces: and the most pure part is fold raw, at the rate of about 31. to 61 per ton, or fent to the fmelting-houses of the respective companies to be melted into metal. Mr Hughes has great furnaces of his own at Ravenhead near Liverpool, and at Swansey in South Wales. An idea of the wealth of these mines may be formed, by considering that the Macclesfield Company have had at once fourteen thoufand tons of ore upon bank, and Mr Hughes thirty thousand.

"The more impure ore is also broken to the size of about hen's eggs; but in order to clear it from the quantity of fulphur with which it abounds, as well as other adventitious matter, it must undergo the operation of burning. For that purpose it is placed between two parallel walls of vast length: some kilus are 20, others 40, and 50 yards in length; some 10, others 20, feet wide, and above 4 feet in height. The space between is not only filled, but the ore is piled many feet higher, in a convex form, from end to end. The whole is then covered with flat stones, closely luted with clay; and above is placed a general integument of clay, and small subbish of the work, in order to prevent any of the fumes from evaporating. Of late, some kilns have been constructed with brick arches over the ore, which is found to be the best method of burning. Within these few years, attempts are made to preserve the sulphur from flying away; and that is done by flues made of brick whose tops are in form of a Gothic arch, many fcores of feet in length. One end of these opens into the beds of copper which are to be burnt. Those beds are fet on fire by a very small quantity of coal, for all the reft is effected by its own phlogiston. The volatile part is confined, and directed to the flues; in its course the fulphureous particles strike against their roofs, and fall to the bottom in form of the finest brimstone; which is collected and carried to adjacent houses, where it is melted into what is called in the shops stonebrimstone.

"The beds of copper, thus piled for burning, are

of vast extent. Some contain 400 tons of ore, others Angles 2000. The first require four months to be completely burnt, the last near ten. Thus burnt, it is carried to proper places to be dreffed, or washed, and made merchantable. By this process the ore is reduced to a fourth part in quantity, but confiderably improved in quality: and by this means the water is strongly or richly impregnated with copper, which is distolved by the acid quality of the sulphur; and is collected or precipitated again by iron in the above-described pits. The iron is all dissolved.

"But a far richer produce of copper is discovered from the water lodged in the bottom of the bed of ore, which is highly saturated with the precious metal. This is drawn up, either by means of whimfies or windmills, to the furface, and then diffributed into numbers of rectangular pits 36 feet long, some pits more some less, 12 to 15 feet broad and 20 inches deep. To speak in the language of the adept, Venus must make an affignation with Mars, or this folution will have no effect. In plain English, a quantity of iron must be immersed in the water. The kind of iron is of no moment; old pots, hoops, anchors, or any refule, will suffice; but of late, for the convenience of management, the adventurers procure new plates, four feet long, one and a half broad, and three quarters of an inch thick. These they immerse into the pits. The particles of copper inflantly are precipitated by the iron, and the iron is gradually diffolved into a yellow ochre. Great part of it floats off by the water, and finks to the bottom. The plates, or the old iron (as it happens), are frequently taken out, and the copper scraped off; and this is repeated till the whole of the iron is confumed. The copper thus procured differs little from native copper, and is prized accordingly, and fold for prices from 251. to 451. a ton.

"This discovery is far from new: it has been practifed long in the Wicklow mines in Ireland; and above a century in those of Hern-grundt in Hungary, where it is called ziment copper. The waters of the Hungarian mines are much more strongly impregnated with copper than those of Parys mountain. The first effects its operation in 12 or about 20 days, the last requires two months. Horse shoes, iron made in shape of hearts, and other forms, are put into the foreign waters; and when perfectly transmuted, are given as

prefents to curious strangers.

"The ore is not got in the common manner of mining, but is cut out of the bed in the fame manner as stone is out of a quarry. A hollow is now formed in the folid ore open to the day, and extends about 100 yards in length, about 40 yards in breadth, and 24 yards in depth. The ends are at present undermined, but supported by vast pillars and magnificent arches, all metallic; and these caverns meander far under ground. These will soon disappear, and thousands of tons of ore be gotten from both the columns and roofs. The fides of this vast hollow are mostly perpendicular, and access to the bottom is only to be had by small steps cut in the ore; and the curious visitor must trust to them and a rope, till he reaches some ladders, which will conduct him the rest of the descent. On the edges of the chasms are wooden platforms, which project far; on them are windlasses, by which the work. men are lowered to transact their business on the face

Inglescy, of the precipice. There suspended, they work in mid Angling. air, pick a fmall place for a footing, cut out the ore in vast masses, and tumble it to the bottom with great noise. In such situations they form caverns, and there appear fafely lodged till the rope is lowered to convey them up again. Much of the ore is blafted with gunpowder, eight tons of which are faid to be annually used for the purpose.

> " Nature hath been profuse in bestowing her mineral favours on this spot: for above the copper ore, and not more than three quarters of a yard beneath the tommon foil, is a bed of yellowish greafy clay, from one to four yards thick, containing lead ore, and yielding from 600 to 1000 pounds weight of lead from one ton; and one ton of the metal yields not less than 57 ounces of filver. Mixed with the earth, are frequently certain parts of the colour of cinnabar. Whether these are symptomatic of the sulphureous arsenical filver ores or of quickfilver, I will not pretend to decide. Something interferes with the successful smelting of this earth in the grate; infomuch that it has not yet been of that profit to the adventurers which might reasonably be expected from the crucible assays of it, and they have at this time about 8000 tons on bank undifposed of. This place has been worked for lead ore in very distant times. In the bottom of the pool was found an ancient smelting hearth of grit stone, and feveral bits of fmelted lead, of about four inches in length, two in breadth, and half an inch thick.

> "These works have added greatly to the population of the island; for about 1500 persons are employed; who, with their families, are supposed to make near 8000 persons, getting their bread from these mines. The little village of Amlwch, the port of the place, is increasing fast, and the market grows confiderable. At the feafon of the greatest work, Mr Hughes's men alone receive for many weeks 200l. in one week, and 150l. in another, merely for sublistence. The port is no more than a great chasm between two rocks, running far into land, and dry at low water: into which floops run, and lie fecure to receive their

lading."

Near Kemlyn bay is a quarry of marble, common to this place, some parts of Italy, and to Corsica, and known in the shops by the name of Verde di Corfica. Its colours are green, black, white, and dull purple, irregularly disposed. In different blocks one or other of the colours are frequently wanting; but among the green parts are oftener found narrow veins of a most elegant and filky white afbestos. It is a compound species of marbles part is calcareous and may be acted on by aquafortis. The green parts partake of the nature of jasper. It is apt to be intersected by small cracks, or by asbestine veins, therefore incapable of taking a high polifit. This quarry lies on the lands of Monachty, in the parish of Llan-Fair-Ynghornwy; and it is found again in the ifle of Skerries, off this parish. Neither the quarry nor the asbestos are at present in use. In Rhoscolyn parish, a green amianthus, or brittle asbestos, is met with in great plenty in a green marble fimilar to the above; but by reason of the inflexible quality of its fibres not applicable to the same

ANGLING, among sportsmen, the art of fishing

with a rod, to which are fitted a line, hook, and bait. An See FISHING-Rod, FISHING-Hook, FISHING-Fly.

The angler's first business is to attract the fish to the place intended for angling. The method of doing this, in standing waters, by throwing in grains, chopped worms, and the like, is well known: but the chief difficulty is in running rivers and brooks. The method. in this case, is to prepare a tin box capable of holding fome hundreds of worms, bored on all fides, and full of holes of fuch a fize as they may be just able to crawl out at; there must be a plummet fastened to this box to fink it, and a line to draw it back at pleafure; in this case it is to be thrown into the water in a proper place, above which the angler may fland under cover. The worms will flowly and gradually crawl out of this box, and the fish will be gathered about to feed on them; the baited hook is to he thrown in higher up and carried down by the stream. If this method do not bring the fish about the place in a little time, there is reason to suspect that some pike lies lurking thereabout, and deters them i in this case, it is proper to throw out a baited hook, and he will generally be taken; after this the attempt will fucceed.

When the angler takes his stand, he is to shelter himself under some tree or bush, or stand so far from the brink of the water that he can only differn his float; as the fifth are timorous and eafily frightened away. The angling rod must be kept in a moderate state, neither too dry not too moist: in the first case, it will be brittle: in the other, rotten. When pastes are used, it is proper to mix a little tow with them, and rub them over with honey; finally, a small anointing with butter is of great use to keep them from washing off the hook. The eyes of any fish that is taken are an excellent bait for almost any other kind of sish. The best way of angling with the fly is down the river, and not up; neither need the angler ever make above half a dozen of trials in one place, either with fly or ground bait, when he angles for trout : by that time the fish will either offer to take, or refuse the bait and

not stir at all.

In a pond, the best place for the angler to take his fland is usually that where the cattle go up into water: in rivers, if breams are fished for, it should be in the deepest and most quiet places; if eels, under the banks of rivers that hang over; perch are to be expected in clean places, where the stream is swift; and chub in deep shaded holes: roach are mostly found where the perch are, and trout only in swift and clear streams. Places where there are many weeds, or old flumps of trees, harbour fish in great numbers, and they usually bite freely there; but there is danger of entangling the line, or fastening the hook to the weeds. In case of this accident, recourse is to be had to a ring of lead, of about fix inches round, fastened to a small packthread: this ring is to be thrust over the rod, and let fall into the water, It will descend to the place where the hook is entangled; and then, by pulling the packthread gently, the hook will be foon difengaged, or at the worst it can only be broke off near the end of the line; whereas, when this is not employed, the rod itfelf is fometimes broken, or the line nearer its upperend.

Deep waters are best for angling in, for the fish do not love to be disturbed by wind and weather.

The openings of fluices and mill dams always bring fish up the current to seek for the food which is brought with the stream; and angling in these places is usually fuccessful.

The best season is from April to October; for, in very cold stormy weather, the fish will not bite; the best times of the day are from three till nine in the morning, and from three in the afternoon till funfet. In an eafterly wind, there is never much fport for the angler; the foutherly winds are the best for his purpole, and a warm but lowering day is most of all to be chosen; a gentle wind, after a sudden shower, to disturb the water, makes a very good opportunity for the angler: the cooler the weather in the hottest months, the better; but in winter, on the contrary, the warmer the day the better. A cloudy day, after a bright moonlight night, is always a good day for sport; for the fish do not care for going after prey in the bright moonshine, and are therefore hungry the next morning

Those who are fond of angling might fave themselves fome fruitless trouble by observing when small fish in a jar take or refuse food. See Fish.

The feveral methods of angling for falmon, trout, carp, tench, perch, pike, dace, gudgeons, roach, flounder, &c. may be feen under the article Fishing.

ANGLO-CALVINISTS, a name given by some writers to the members of the church of England, as agreeing with the other Calvinists in most points except church government.

Angro-Saxon, an appellation given to the language fpoken by the English Saxons; in contradistinction from the true Saxon, as well as from the modern

English.

ANGLUS (Thomas), an English priest, well known for the fingularity of his opinions, and several little tracts which he wrote in the 17th century. He went by feveral names. Mr Baillet fays his true name was White; but that he used to disguise it under that of Candidus, Albus, Bianchi, and Richworth; but he was most known in France by the name of Thomas Anglus. Des Cartes generally called him Mr Vitus. He paffed some time in most countries of Europe; but his longest stay was at Rome and Paris. When he was in England, he lived a confiderable time in the family of Sir Kenelm Digby; and feems to have had a great esteem for the opinions of this gentleman, as may be seen in his writings, particularly in the Preface to his Latin work concerning the Institutions of the Peripatetic Philosophy, according to the hypothesis of Sir Kenelm. He was a great advocate for the Peripatetic philofophy. He attempted even to make the principles of Aristotle subservient to the explaining the most impenetrable mysteries of religion; and with this view he engaged in the discussion of predestination, free will, and grace. Mr Baillet fays, "What he wrote upon this subject resembles the ancient oracles for obscurity." In fuch abitrufe points as we have mentioned, he was much embarrassed; and, by giving too great scope to his own thoughts, he pleased neither the Molinists nor Jansenists. He is allowed, however, to have been a man of an extensive and penetrating genius. On the 10th of June 1658, the congregation of the Index Expurgatorius at Rome condemned some treatises of Thomas Anglus. The doctors of Douay censured also 22 propositions extracted from his Sacred Institutions.

He published his Supplicatio postulativa justitia, in op- Angoli position to their censure; wherein he complains that they had given him a vague undetermined censure, without taxing any particular proposition. He died some time after the restoration of Charles II. but in what year is uncertain.

ANGOL, a city of Chili in South America, fituat-

ed in W. Long. 78° and S. Lat. 38°.

ANGOLA, a kingdom on the western coast of Africa, lying, according to the most probable accounts, between Lat. 8. 30. and 16. 21. South, forming a coast of upwards of 480 miles; but how far it extends from west to east, has never been exactly determined. Angola Proper is bounded on the north by the river Danda, which separates it from Congo; and on the south by the Coanza, by which it is separated from Benguela. This last, however, is now included in the kingdom of Angola, having been conquered by its monarchs, though it still retains the name of kingdom, and isincluded in the dimensions we have just now given. The air here is very hot and unwholesome, and the country mountainous; there being but few plains to be met with in it, except on the sea coast, and between the huge ridges of mountains.

That part of the kingdom which we have diffinguish-Originally a ed by the name of Angola Proper, was subject to the province of kings of Congo in the year 1484, when the Portuguese Congo. first discovered the country: but how long it had been so before that time, is not known; the inhabitants being utterly destitute of chronology, and having no other way of diffinguishing past events, but by faying they happened in such a king's reign. Neither, though Angola became a distinct kingdom since its discovery by the Portuguese, is it known with more certainty at what time that revolution happened; or whether the Portuguese were not concerned in affishing the viceroy of the king of Congo, who governed the province of

Angola, to fet up for himfelf.

All accounts agree, that this kingdom was founded Tradition by one Ngola or Angola, from whom it took its name. concerning According to the tradition of the country, this Ngola its becomwas a smith, and the inventor of that trade, in which find king, he had been instructed by the demons of the country.dom. In consequence of this, he became exceeding rich, not in gold, filver, or shell money, which were not at that time in use, but in corn, cattle, and fruits, which were then exchanged in traffic. The country being not long after visited by a grievous famine, Ngola generously relieved his distressed countrymen, and saved the lives of some thousands. In gratitude for this generosity, he was unanimously chosen king; and hence the fmith's trade is reckoned among the royal arts of Angola.

According to other accounts which can be more de-More aupended upon, Ngola was the king of Congo's viceroy; thentic ac. who, having become powerful by the reduction of feve-count. ral of the neighbouring states, was induced to fet up for himself. Dreading, nevertheless, the power of his old master, he chose to fend him the usual tribute and presents annually, till he reckoned himself firmly seated on the throne, and had fecured it to his descendants. His measures were greatly facilitated by the wars which the king of Congo was then engaged in with the Giagas, a barbarous nation in the neighbourhood. These made fuch a powerful inroad into his dominions that he was glad to ask assistance from Ngola; not as a subject, but

as a friend and ally. This was readily granted; and the two monarchs continued ever after fending, prefents and affishance to each other, and encouraging a mutual commerce between their subjects.

ola the but king.

Ngola lived to a great age, highly respected by his subjects, and in alliance with the king of Congo and the Portuguese, whose numerous settlements on the coast had made them become very powerful. According to the custom of the country, he had many wives and concubines. By his chief favourite he had three daughters, Zunda Riangola, Tumba Riangola, and another whose name is unknown. Towards the latter part of his life, the king's chief care was to fecure the crown to the eldest of these; for which purpose he confulted his beloved queen, who encouraged him in the defign with all the eloquence in her power. By her advice, he fent for his lieutenant-general, a favourite flave, whom he had created viceroy over the whole kingdom, to acquaint him with his resolution. The artful minister did not fail to applaud his design, though his intention was to defraud the princefs, and feize the throne for himself. He accordingly took the opportunity, one day, when that princess and the whole court were employed in fowing their lands, to fpread a report that the Angolic enemies had entered the kingdom, and were destroying every thing with fire and fword. In this confusion, the treacherous viceroy conducted the three princefles to the royal palace; and acquainting Ngola with the pretended danger, urged him to betake himself to a speedy flight. The frighted monarch, unable to ftir with age, defired his minister to take the most proper means for his safety: whereupon, being a stout young fellow, he takes his majesty on his back, and carries him into a neighbouring wood; where he no fooner had him in a convenient place, than he by his prime stabbed him with a dagger. This stratagem was too shallow to remain long concealed; the murderer was who seizes quickly discovered, and many of the nobles rose in arms he throne. against him; but finding his party too strong to be opposed, they were at last obliged to submit, and suffer him quietly to ascend the throne, upon his publicly declaring that he had not seized it but with a view of securing it to the princess Zunda Riangola.

ngola.

Aurders

To this princess the usurper palliated his conduct in the best manner he could; and she had art enough to disguise her resentment so effectually, that he never Death of the discovered the smallest occasion for jealousy. At last, his fudden death gave Zunda an opportunity of afcending the throne peaceably; when she behaved with such Zunda Ri. moderation and justice as to gain the love and affection of all her subjects. Her jealous temper prevented her from marrying; and, by giving too much way to it, she came at last to dread as rivals the two sons of her younger fifter Tumba, and to form deligns against their life. To accomplish her purposes, she ordered them to be brought to court, pretending to have them educated under her own eye. This was declined for some time; but at length the queen prevailed so far as to have the eldest fent to her; whom she no sooner got into her power, than she caused him to be massacred, with all his attendants; only one escaping, all covered with wounds, to carry the dreadful news to the princels and her hufband.

On hearing of this bloody act, the afflicted parents immediately fallied forth at the head of all their vaffals.

They were waited for by Queen Zunda at the head of Amou a numerous army; but no sooner did her soldiers perceive the parents of the deceased prince, than they immediately abandoned the queen to their refentment. Tumba immediately rushed upon her fister, and stab-10 herself bed her to the heart; after which, she commanded her murdered entrails to be taken out, and thrown into the hole in by her which has fore hody had been out. Hope this Turnen fafter. which her fon's body had been cast. Upon this Tumba was crowned queen of Angola, and invited her hufband to participate with her in the management of public affairs. This offer he was too wife to accept; and Tumba, upon his refusal, resigned the crown into the hands of her furriving fon, named Angola Chilvagni. He proved a great and wife prince, extending his dominions by conquest, and gaining the love of his subjects by the moderation and equity of his government. He was succeeded by one of his younger sons, named Dambi Angoli; who no sooner ascended the throne, Dambi An than he put all his brethren to death, lest they should gola a crue unite in favour of the eldeft. The rest of his reign tyrantproved conformable to fuch a beginning. He was a monster of cruelty, avarice, lewdness, and perfidy. Death, however, in a short time, happily delivered his fubjects from this tyrant; who, notwithstanding his infamous life, was, buried with the greatest magnificence; and a mount was erected over his grave, confifting, according to the custom of the country, of a prodigious number of human victims which had been facrificed to his ghost. Dambi Angola was succeeded Ngola Chi by Ngola Chilivagni, a warlike and cruel prince. He livagni, his conquered many nations, and made the most dreadful inroads into the kingdom of Congo, along the rivers of Danda, Lucalla, Zanda, and Coanza: whose waters were often tinged with the blood of thousands whom he massacred in his excursions. Notwithstanding these butcheries, Ngola Chilivagni showed such generosity to those who readily submitted to him, that he was sure to conquer, not only wherever he came, but wherever he feemed to direct his forces. At last, as if weary of conquest, he planted a tree on the banks of the Coanza, about eight leagues from Loanda San Paulo, as a boundary to his ravages. This tree the Portuguese called Isanda, or Isandaura; and afterwards erected a fortress near it.

The fame folly and infolence which took place in the Fancies breast of Alexander the Great, on account of his rapid himself a conquests, soon puffed up the mind of this petty Afri-god. can tyrant. Because he had conquered and ravaged fome of the neighbouring countries, and brought unper his subjection a few cowardly barbarians; he first faucied himself invincible, and then that he was a god. He demanded the same respect and adoration that was paid to their other deities; and with this demand his Subjects were servile enough to comply. This pretended deity, however, was forced to submit to the fate of other mortals, and died without leaving a successor be-

On the decease of Ngola Chilivagni, the states elected Ngingha-Angola-Chilombo-Kickafanda, great nephew to Queen Tumba's husband, as his successor. He proved fuch a rapacious and cruel tyrant, that his fubjects univerfally wished for his death; which, luckily for them, fuon happened. He was interred with the usual pomp and folemnities, particularly that of having a whole hecatomb of human victims facrificed upon his

li Angola.

he Portu-

juefe-

Ingola grave. His fon Bandi Angola, who succeeded him, proved yet'a greater tyrant than his father; fo that he foon became intolerable to his subjects. A general revolt enfued, in which his subjects called in the cannibal Giagas to their assistance. These immediately poured in like a band of hungry dogs hastening to feed upon a carcals; and having defeated and devoured the forces of the tyrant, belieged him in an inacceffible mountain; where, not being able to come at him, they refelved to Quelled by reduce him by famine. Bandi Angola applied to the king of Congo for affistance. As it was the interest mee of the of that prince to hinder the ravenous Giagas from entering into the Angolic dominions, when they could fo eafily pass into his own, he did not hesitate at granting his request; and ordered a strong reinforcement of the Portuguese, of whose valour he had a high oponion. and of whom he entertained a great number at his court, to march to the affishance of the king of Ango-The command of the army was given to one of the most experienced Portuguese officers; who, depending more on the handful of Europeans he had under his command than on the Congocie, attacked the rebels, though greatly superior in number; and having utterly defeated them, restored the king of Angola to his throne.

with the Portuguese general;

This effential piece of service so endeared the Portuguese to Bandi Angola, that he took them into his fer-The king's vice, and even into his council. Their general became a great favourite of the king, but much more fo of his falls in love daughter, who conceived a violent passion for him. Unfortunately for them both, the amour was carried on with fo little precaution on her part, that the king quickly discovered it; and immediately formed a resolution of exterminating the Portuguese all at once. Such violent measures, however, could not be concerted so privately but the princess got some intelligence of who retires it; and having apprifed her lover of his danger, he imto Congo, mediately withdrew into Congo, taking with him as many of his countrymen as he conveniently could. The king of Congo expressed such strong resentment against Bandi Angola for his ingratitude, that the Portuguese general would have probably prevailed upon him to declare war against Angola, had he not been obliged to defend his own dominions against a neighbouring prince who then made an invation. This afforded that general a fair pretence of asking leave to return home; promissing to come with such reinforcements as would enable the king of Congo to revenge himself for the affront put upon him by the Angolic monarch. His real intention, however, was, to give the king of Portugal an opportunity of seizing upon the kingdom of Angola.

Lays a plan On his return to Lisbon, the Portuguese general havor the con- ing laid his plan before the king, it was so well relishsueft of An-ed, that an armament was ordered to be fitted out, well the king of furnished with every necessary for building fortresses, &c. and a fufficient number of men. The wind proving favourable all the way back, the Portuguese soon arrived fafe at Loanda San Paulo; whence the general despatched a messenger to acquaint the king of Congo with his arrival, and to make him some rich presents. These were no sooner gone than the admiral sailed up the Coanza; and, landing without opposition in the kingdom of Angola, set about erecting a fortress in

Von II. Part I.

a convenient fituation, which was completed in a few Angela. The king being informed of the return of the Por-

tuguese, and of their fortifying themselves on advantageous ground, gathered together a numerous army : but his forces, though upwards of 100,000 in number, Defeats the were utterly defeated by the Portuguese; vast num-Angolana bers killed, and many more carried into slavery. The admiral now ravaged the whole country, putting all to fire and fword, and making himself master of every advantageous fpot of ground. The king, however, had still the good luck to escape all the fratagems that were laid for him; and once more got fafe to his inacceffible fortress.

All this time Bandi Angola had himself tyrannized, and allowed his favourites to tyrannize, in fuch a manner, that his subjects were become no less weary of his government than when they formerly revolted. Being now exasperated beyond measure at the calamitous war of which he had been the occasion, they formed a defign of putting an end to his life; and in order to draw hun out of his retreat, where he wallowed in all manner of debauchery, they had recourse to the following fratagem: A deputation was fent, acquainting him with the revolt of one Cuculo Cabazzo; who, at the head of a numerous band, committed the most cruel ravages. They befought his majesty, either to levy a fufficient number of troops, and march in person against him, or to allow them to arm themselves against him. The credulous king complied with this last propofal; and granted them leave to raife what forces might be thought necessary. Four days after, notice was lent to the king, that his subjects had attacked the rebels, and had been repulled with loss; but that, if his majesty would but condescend to animate them with his prefence, the fight of him would inspire them with such courage, that they would affuredly prove victorious. This had the defired effect; and the king fet out a few days after, without any other precaution than his own guards, to head his army which was encamped on the banks of the Lucalla. He no fooner appeared in view Bandi Authan all the chief officer came out to meet him; and gola murhaving, under pretence of paying their respects, gra-dered. dually separated him from his guards, they fell upon him and defpatched him at once.

Bandi Angola was fucceeded by his fon Ngola Bandi, whose mother had been a slave, and whose title to the crown was confequently disputable, according to the laws of the country. Of this the new king being well Crucky of apprifed, thought proper to begin his reign by mur-the new dering every person who had opposed his election. He king. began with the Tendula, or commander of the king's rear guard; who, by his office, is the chief of the electors, and the person who governs the kingdom during the interregnum. Him he ordered to be put to death, with all his family. These were followed by the principal officers of his father's court; all his concubines, together with their parents and near relations, whom he caused to be butchered; together with his halfbrother, his father's fon by a favourite concubine, and then but an infant. He did not spare even the son of his fifter Zingha Bandi, whom she had by one of her paramours. The interest of his fifter had contributed greatly to raise this tyrant to the throne; and his in-

gratitude,

Angola. gratitude, with the murder of her fon, so exasperated her, that she swore to be revenged on him in the same way.

The Portuguese were the next objects of his resentthe Por-ment. These he so much dreaded on account of their is redu-refolving not to lay down his arms till he had extermiof his dominions. His rashness, however, cost him dear. Myriads of the Angolic poltroons were overthrown by an handful of Portuguese; and the king himself was forced to fly, first into the island of Chiconda in the river Coanza, and then into the deferts of Oacco. Here his conquerors, out of great clemency, allowed him to live among the wild beafts, without any other fustenance than what the deferts afforded. He had the miffortune also to lose his queen and two sisters Cambi and Fungi, who were taken prisoners by the Portuguese, but honourably treated.

The king being informed of this, sent an embassy to treat of their ransom and an exchange of prisoners. The proposal was readily agreed to; and the princes-It's treach-fes were fent back, laden with prefents. The king, however, refused to perform his part of the agreement, and thereby plunged himself into still greater difficulties. A new Portuguese viceroy being arrived about this time, Ngola was quite at a loss how to excuse the non-performance of his part of the treaty. At last he fter Zing-had recourse to his exasperated fifter Zingha; and having excused, as well as he could, the murder of her fon, proposed to fend her on a splendid embassy to the viceroy. Having confented, but without forgetting her refentment, the fet out, as plenipotentiary for the king of Angola, with a magnificent retinue, was received with all the honour due to her rank, and lodged

At the first audience Zingha had of Don John (the

Portuguese viceroy), she was greatly surprised to find

in a splendid palace prepared for her.

a flately elbow chair prepared for him to fit upon, and for herfelf only a rich tapeftry spread on the floor, with a velvet cushion embroidered with gold, and placed over against the chair of state. Dissembling her displeasure, however, the beckoned to one the ladies of her retinue, commanded her to lay herself down on her elbows and knees upon the carpet, and fat herfelf upon her back during the whole time of the audience. She behaved with fuch address and dignity, as to gain the admiration of the whole council. A propofal was made of entering into an alliance offensive and defensive with the king of Angola, provided he acknowledged himfelf the vaffal of the king of Portugal, and submitted to pay a yearly tribute. To this Zingha replied, that fuch conditions were indeed fit to be imposed upon those who had been conquered by the sword; but not upon a great and powerful monarch, who only fought their friendship and alliance: upon which the treaty was concluded on both fides, without any other conditions than the exchange of prisoners. The audience being over, Don John took notice to Zingha, as he conducted her out of the hall, that the lady who had

ferved her as a feat, continued still in the same posture;

upon which she replied, That it did not become the

ambassadress of a great monarch to make use of the

fame chair twice, so she looked upon her as a piece of

cast off goods not worthy of further notice.

Zingha was fo taken with the honours done her by Angola. the Portuguese, and so intent upon observing the erder, dress, arms, &c. of their troops, that she staid at Loanda a confiderable time; during which she was instructed in the Christian religion, and confented to be Embraces baptized. Don John and his spouse were her sponsors; the Chriwho dismissed her soon after, with all possible honours, stian reliand highly fatisfied with her reception and fuccefs. gion. At her return, she took care to have the articles ratified by her brother; who expressed his approbation of them, and the highest obligations to her. He even went fo far as to defire the viceroy to fend him fome proper perfons to instruct him in the Christian religion, which he faid he was very defirous of embracing. This request was immediately granted; and Don Denis de Faria, a negro priest, a native of Angola, was despatched, along with an officer of distinction, to stand godfather to the king. These met at first with a gracious reception: but when they came to talk of baptifm, Ngola altered his tone, and told them it was too much below his dignity to receive it from the fon of one of his flaves, and fent them both back. This was cried up by the courtiers as a princely act: but Zingha represented, that it could not fail to exasperate the viceroy; and tried all possible means to disfuade him from it, but in vain. He suffered, however, his other two fisters, Cambi and Fungi, to be baptized; which was performed in 1625, with a splendour suited to their dignity.

As no experience feems to have been a sufficient an- War again tidote against the innate folly of Ngola Bandi, he soon declared a after took it into his head to make war on the Portuguess guist the guese, and invaded some of their territories. This has Portuguess guese, and invaded some of their territories. This last action proved his ruin: his troops were all cut off, and himself forced to swim for his life to a small island in the Coanza, about a mile long, and two bow shoots in breadth; whither the Portuguese pursued and surrounded him; fo that he had no other chance, but either to all into their hands, or be devoured by the wild beafts with which the place swarmed. From both these dangers he was relieved by a dose of poison, given The king him, as was supposed, by his fifter Zingha. Before this poisoned. time, however, he had taken care to fend his eldest fon to the country of the Giagas, and put him under the care of one of their chiefs, called Giaga Caza, whom he befought to take care of him, and protect him from his aunt Zingha, as he rightly imagined she would not fail of attempting his life, in order to secure herself on

the throne.

Zingha Bandi was crowned queen of Angola, with-Zingha: out opposition, in 1627 .- She was a very artful woman, Bandi endowed with great presence of mind, firm in her resolu-crowned tions, of an intrepid courage, and a great miftress in the art of diffimulation. She inherited a large share of her brother's jealous and cruel temper, to which she would not hefitate to facrifice her nearest relations, if they gave her the least umbrage. To this jealousy, therefore, she resolved to sacrifice her nephew, as well knowing he had a better title to the crown than herfelf. She made use of the most solemn oaths to draw him out of the hands of his guardian, protesting that she had accepted of the throne with no other view than to preferve it for him. But Giaga, being well acquainted with her temper, was proof against all her oaths and fair speeches .- Zingha, finding this method ineffectual, pretended

Angola. pretended a defire of refigning the crown to hernephew, to which she said she had no other objection, than that the was afraid he was yet incapable of affuming the reins of government. She therefore defired an interview with him, though ever so short, that she might satisfy herfelf in this particular, and promifed to detain him no longer than Giaga should think necessary. thought there could be no danger in confenting to a short interview; and therefore sent the unfortunate prince to her, attended by a magnificent retinue. The cruel queen no fooner got him in her power, than the She murlers her ne-murdered him with her own hand, and caused his body to be thrown into the Coanza, ridding herfelf, by that inhuman act, of a dangerous rival, as well as revenging herfelf on her brother, as she had sworn to do, for the murder of her fon.

Zingha's next scheme was to rid herself of the Portuguese, who had established themselves in such a manner as to be almost entire masters of the country. They had built fortresses on every convenient spot that suited them, especially near her principal towns, which they could level with the ground with the greatest ease. They had engroffed all her commerce, were become very wealthy, and their numbers increased daily; so that they were dreaded not only by her subjects, but by all the neighbouring nations. As Zingha was of a martial temper, she did not long hesitate. She quickly made all necessary provisions, strengthened herself war against by alliances with the Giagas, and other idolatrous nations, and even with the Dutch and the king of Congo. With this combined force she attacked the Portuguese fo fuddenly and unexpectedly, that she gained some advantages over them; and the Dutch made themselves masters of San Paulo de Loando, and soon after of some of the best provinces in the kingdom. This happened in the year 1641; and the Portuguese did not recover these places till the year 1648, when the Dutch were entirely driven out of Angola.

Zingha's fuccesses proved still more short lived. Her allies the Congoese were so completely overthrown, that they were forced to fue for peace; which the Portuguese did not grant till they had obtained a sufficient number of hostages, and obliged the Congoese to deliver up to them some considerable posts, upon which they immediately erected fortresses. Zingha's troops were now defeated in every hattle; and these defeats followed one another so close, that she was soon abandoned, not only by her allies, but by her own troops. She was now constrained to abandon her dominions, and retire to some of the eastern deserts, whither the Portuguese did not think it worth while to follow her.

Zingha being reduced to such distress, the Portuguele, after giving her some time to ruminate on her fituation, fent her proposals of peace, upon condition that she should become tributary to the crown Refuses to of Portugal. This proposal she rejected with scorn; hecome tri- and let them know, that, however her dastardly subjects might submissively and shamefully behave towards them, their queen disdained subjection to any foreign power. They set up On this haughty answer the Portuguese, to mortify her still more, fet up a king in her place. The perfon they pitched upon was named Angola Oarij, or Aaru, who was of the royal family. Before he was crowned, the Portuguese obliged him to turn Christian; and he was accordingly baptized by the name of John.

The new king, however, foon died of grief, at feeing Angola. himself so hardly treated by his matters the Portuguese. They quickly set up another, named Philip; who bore the yoke with more patience, and lived to the year 1660.

In the mean time Zingha, exasperated at seeing Zingha's herself deprived of eleven of the best provinces in her postaty a dominions, and her authority in the remaining fix horrid be greatly weakened, renounced the Christian religion, barity. and embraced all the horrid and bloody cuitoms of the Giagas, whom she outdid even in their own barbarity. -We have already hinted the barbarity of this nation in eating human flesh. In this Zingha not only joined them, but took pleasure in devouring the raw flesh of human victims, and drinking their blood while warm both at her facrifices and at her public meals.—She affected a martial and heroic spirit, together with an utter aversion to the male sex; but, according to the Portuguese, maintained a number of the strongest and lustiest youths, in whose embraces she gave a full scope to her inclinations, and managed matters with fuch fecrecy that her intrigues could never be discovered. At the same time she ordered many of her own fex to be ripped up, when their incontinency was manifested by their pregnancy; and their bodies with those of the infants to be cast to wild beatts.

But what made her most admired, as well as dreaded, by her fubjects, was a notion that she had by various stratagems inculcated upon them, of her being able to penetrate into the most fecret thoughts. To keep up this apprehension, she ordered the bones of her deceased brother to be brought from the island where he was poisoned, locked up in a cheft covered with coarse plates of filver, and laid on a fine carpet upon a pedeftal. A number of finghillos or priefts were ordered to offer facrifices to these bones, and to keep lamps continually burning before them. To this place the herfelf frequently repaired, to affift at those rites, which, as she gave out, and every body believed, engaged the spirit of the deceased-to inform her of every thing that was done, faid, or even defigned, either in the kingdom or out of it. - To procure, however, as much real intelligence as possible, she kept vast numbers of spies all over the kingdom, who constantly gave her notice of what happened in their respective circles: and this she so cunningly improved to her own ends, that her fubjects looked upon her as a kind of deity from whom nothing could be concealed.

By such means as these, Zingha gained such autho-Her influ rity over the Giagas, that they were ready, at the very ence over first indication of her will, to follow her through the the Giag most dreadful dangers, and to engage in the most defperate enterprises. She now made many strenuous and daring efforts to drive out the Portuguele; but though the had, in all probability, more valour and skill than her enemies, the fire arms gave them fuch an advantage, that she was always defeated with great loss. Perceiving therefore the folly of attempts of this kind, the contented herfelf with making continual inroads into their country, carrying off or destroying every thing that fell in her way. Though the spared nei-Herteril ther Europeans, nor blacks, who were subjects of the ravages. mock monarchs fet up by the Portuguele, yet the case of the former was peculiarly dreadful when they happened to be taken prisoners. They were either roafted

dagola by a flow fire, or had their fiesh cut off in pieces, and devoured before their faces, in the manner related by See Abyf- Mr Bruce of the Abyffinian oxen*. In this manner the infested the Portuguese territories for 28 years, scarce ever allowing them a moment's cessation of arms. Their mock-kings were often obliged to shelter themfelves from her fury in an inaccessible rock called Maopongo; and they themselves could never hope to enjoy their dominions with any kind of peace fo long as this furious queen continued alive. They in vain exhausted all their politics either to reduce her by force, or to mollify her by presents and fair offers. The one she rejected with disdain, and always found means to haffle the other. Nor would she hearken to any terms, unless they confented to refign all their conquests. The refusal of this demand was so commonly followed by fome marks of her refentment, that it was with the utmost difficulty the Portuguese could prevail on any body to carry their propofals to her; and as for Zingha, the disdained to make any to them, except those of the hostile kind. The terror of her arms procured her a free passage wherever she directed her course; all the inhabitants of a province making no less haste to abandon, than she to invade it. Thus she continued to advance, till at length she was got so far as the small island of Dangii in the river Coanza. The Portuguese now found themselves under the neceffity of raifing an army of negroes, in order to drive her out of it. Accordingly they furrounded the island, and entrenched themselves along the banks on both sides of the river; but while they were bufy at their work, Zingha attacked them with fuch advantage, that she killed and wounded feveral hundreds of the blacks, and fome of the white men. Elated with this advantage, the was preparing for another attack; when the perceived, to her surprise, that the Portuguese had drawn their lines fo close, and raised them to such a height, that they overlooked her whole camp, and could fire upon her naked foldiers as if they shot at a mark .--Thus great numbers of her men were cut off, particularly her chief officers. The queen, now perceiving the danger of her lituation, amuled the Portuguele with Outwits the proposals of an accommodation; and having obtained Portuguese. a truce for three days, crossed the river in the dead of the night, and led her forces to the province of Oacco. The next morning, the Portuguese, seeing no human creature upon the island, began to apprehend some new stratagem; but, upon landing some of their troops, they perceived themselves over-reached, and deprived of the fairest opportunity they ever had of forcing her to furrender at discretion.

Zingha staid no longer in the province whither she had retired, than till she was assured that the Portuguese were retired from the Coanza; and then, croffing that river once more, marched directly towards the kingdom of Metamba, which had been invaded by fone of the neighbouring princes. The fpeed with which she led her forces thither, and recruited her army with multitudes of Giagas, who were all emulous of 17 fighting under her banner, quickly enabled her to recover some of her territories in that kingdom. Beginning now to think herfelf successful, the again attacked the Portuguese; but was defeated with great loss, so as to be obliged to fend for fresh troops. To complete her misfortune, the received news that the Giaga Caffangi had taken the advantage of her absence, to en- Angola, ter the kingdom of Metamba with a numerous army, had carried off the greatest part of the inhabitants, destroyed all the fruits of the earth, plundered the towns of all that was valuable, and fet fire to the rest, leaving that kingdom in a manner defolate. To add to all this, her troops, exasperated at the loss of their wives, children, and goods, which were carried to the farthest corner of Benguela, were all on the point of

Notwithstanding these disasters, Zingha behaved The Portuwith fuch resolution and address, that the Portuguese, guese send who, according to character, had probably influgated an embally the Giaga against her, were so much afraid of her to her. joining with him in alliance against them, that they despatched one Anthony Coglio, a learned priest and an excellent negotiator, with Don Gaspar Borgia an eminent officer, under pretence of negotiating a peace between them, first to the Giaga, and afterwards to the queen. They met with a very civil reception from the first, who told them that he was very willing to live at peace with that princess, and even to let her enjoy the kingdom of Metamba, though he was the rightful heir to it, provided she would lay down her arms. This answer encouraged the priest to try whether he could prevail on him to embrace the Christian religion; but this was declined by the Giaga in fuch firong terms, that the priest thought proper to defist, and fet out for Zingha's camp.

The ambassadors, at their first arrival, met with such Their proa polite reception, as made them hope for success: but posals reafter she had heard their proposals, she assumed a jected. haughty threatening tone, and told them in the conclufion of her speech, "That it did not become her dignity to lay down her arms, till she had brought the war fhe had begun to an honourable conclusion: that as to the Giagas, whose sect she had embraced some years before, and who had furnished her with such a prodigious number of forces to fight in her defence, her honour and interest required that she should still keep them in her fervice, and under her protection: and lastly, that as to herself, she remembered, indeed, that the had formerly embraced Christianity; but that it was not now a proper feafon to propose her returning to it, and they ought to remember that they themselves were

the cause of her abandoning it."

Borgia, perceiving that she was not to be wrought upon by religious motives, shifted the topic; and told her, that she had gained honour enough in war, and that it was now high time to think of granting peace and tranquillity to the subjects of two such powerful kingdoms, and accept of the favour and friendship of the king of Portugal, which was offered her by his viceroy. To this the queen made answer, that she was perfectly well acquainted with the valour and strength of the Portuguese, and should esteem it an honour to be allied to that monarch; but that the thought it just that their respective claims to the dominions which she justly inherited from her ancestors, and of which he had unjustly deprived her, should first of all be decided, either by the fword or by fome equitable judges.

Borgia, vainly imagining that he had now obtained enough, set off immediately for Loanda San Paulo; but left the priest, on some pretence or other, to see whether, in the time of fickness, he could make any impression

fortunes.

Angola. impression on the instexible mind of Zingha, who now laboured under a lingering disease. Coglio, however, found all his arts to no purpole; and, upon the queen's recovery, she recommenced the war with more fury than

Zingha's arrow ccape.

For fome time hostilities were carried on with various success; Zingha being sometimes victorious and fometimes descated. In one attempt of the latter kind, before the fortress of Massangana, she not only lost a great number of men, but had her two fifters Cambi and Fungi taken prisoners, she herself escaping with the utmost difficulty. Exasperated by this loss, she led her troops into some of the best provinces of the Portuguefe, and reduced them to a mere wilderness. Still, however, she had the mortification to find her losses vally greater than what the gained: and had now the additional misfortune of loting her fifter Fungi, who was put to death by the Portuguese for treachery, and feeing her allies the Dutch totally expelled out of Angola.

legins to elent;

Zingha being thus oppressed with a complication of misfortunes, and conscious of the crimes she had committed, began feriously to consider whether such a continued feries of difasters was not owing to the displeasure of the God of the Christians. To this opinion she feemed to have inclined; and therefore began to treat with more lenity fuch Christians as fell into her hands, especially if they happened to be priests or monks. To these she now began to listen with some attention; and ordered them, under fevere penalties, to be treated with all possible respect; yet without losing in the least that invincible hatred the had conceived against those who had stripped her of her dominions, or dropping her resolution never to make peace till she had recovered

ut ftill re-

The viceroy, Don Salvador Correa, who had driven fis the ar- out the Dutch, being apprifed of the regard shown to fice of the the elergy by Queen Zingha, thought proper to fend fortuguese. fome Capuchins to her, in hopes that they might now find her more tractable. But Zingha was fill proof against their utmost art; observing, however, that if they would consent to restore what they had unjustly taken from her, she would not only return to the Christian religion, but encourage it to the utmost of

The viceroy, being now afraid that Zingha might make an alliance against him with the king of Congo, first raised a powerful army, and then acquainted that monarch, that, if he designed to prevent the total ruin of his dominions, he must immediately make reparation for all the damage he had caused to the Portuguese by his alliance with the Dutch. The fame of the Portuguele valour so intimidated the king, that he submitted to a treaty almost on the viceroy's own terms; and as foon as this treaty was concluded, Don' Ruy Pegado, an old experienced officer, was despatched to Zingha, offering a firm and lafting alliance with her, provided she renounced the Giaghan sect, and returned to the bo-fom of the church. To this embassy she returned the old answer, namely, that the Portuguese themselves had been the occasion of all that had happened; as they had not only stripped her of her hereditary dominions, but dared to proclaim one of her vassals king of Angola; but, provided these dominions were restored, she would immediately embrace Christianity.

All this time the furious queen Zingha went on with Angola. her ravages, notwithstanding the viceroy kept plying her with letters for near three years. At last he had Fheir infarecourse to the artifice of taking advantage of the remous conmorse for her crimes with which Zingha was sometimes duck. affected, in order to procure the peaceable enjoyment of his own ill-gotten conquests.

It is easy to see, that had this viceroy, or the priests he employed, really intended to convert Zingha to Christianity, they ought to have so far fet her an example, as at least to abandon part of the countries of which they had robbed her: But, instead of this, they impiously made use of the facred name of our Saviour, in order to deter a poor favage African from recovering

what juftly belonged to her.

Queen Zingha, at last, came to incline so much to She returns return to the Christian religion, that a general mur-to Christiamur ran through her army. But having, by various nity. artifices, reconciled the minds of her fubjects to this event, the explained her defign in a fet speech; offering at the same time liberty to those who chose to abandon her on this account to go where they would; and fuch was their attachment to her, that even in fuch a fudden and important change in her resolutions they expressed no uneafiness, but on the contrary applauded her to the highest degree.

The Portuguese, after having been harassed in a terrible manner for 28 years, and at last obliged to profane the name of their Saviour to procure a peace, began now freely to enjoy the fruits of their villany. A treaty was fet on foot between the viceroy and Zing-Treaty with ha; which, however, was not eafily concluded. She the Portudemanded the release of her fifter Cambi, whose Christier Prostian name was Donna Barbara; and the Portuguese posed. demanded a ranfom of 200 flaves, or an equivalent in money. This Zingha did not well relish; and, being pressed to a compliance, threatened them with a more furious war than any they had yet experienced. Upon this the viceroy was obliged to have recourse to the usual method of sending priests to persuade her to comply through motives of religion. These hypocrites effeeted their purpose; and the slaves were sent, as if Christianity required the delivering up innocent people to those who had no lawful authority over them: but not being able to conclude a lasting peace about the. cession of the Angolic provinces, they were forced to conclude a short truce, and sent back her sister.

This princels was received by Zingha in a very affectionate manner: and, some time after, the queen, her mind being probably weakened through the infirmities of old age, not only was thoroughly reconciled to the Portuguese, but looked upon them as her best friends. She encouraged the Christian religion; had a church built in her capital; made feveral laws against Paganism; and, to encourage marriage, she herself wedded a handsome young fellow in the 75th year of her

The Portuguese now imagining they would at last gain their point, proposed to her the following terms, as the hafts of a lasting treaty between the two nations. 1. " That they should yield to her, as a present, some The Portuof the countries of which they had already robbed her, guese terms 2. That, in confideration of the faid present, which. should in noways be interpreted -3 an investiture, the . queen should pay yearly a certain acknowledgement to

Angola. the king of Portugal, who should be at liberty to withdraw the faid prefent whenever the failed of making the said acknowledgment. 3. That a free commerce should be opened between those two states, as well for flaves as for other merchandifes. 4. That the queen should molest none of the lords that were feudatory to the Portuguese, whatever damages or ravages they might have committed during the late wars between them. 5. That she should restore all the Portuguese slaves that had taken refuge in her dominions. 6. That fhe should deliver up the Giaga Colanda, who had revolted from the Portuguese, upon condition that his crime should go unpunished."

The queen, having now a thorough view of the deeprooted villany of those with whom she had to do, conceived fuch displeasure against the Portuguese, that she fell fick. During this fickness, Father Anthony, her chief confidant, and a creature of the viceroy, never left off foliciting her to make her peace with God, and to accept of the terms offered her by the Portuguese: but Zingha, though worn out with age and fickness, had still the good sense to perceive, that there was no connexion between making her peace with God and complying with fuch infamous terms; and therefore The queen's gave the following answer, which under such circumstances, shows a magnanimity scarce equalled in any age or in any country. 1. " That as to her converfion, as it was neither owing to any defire of obtaining a peace, or other worldly motives, but the Divine grace by which she was recalled, she was resolved to persevere in it to her last breath. 2. That as to her going over to the Giagan feet, she had in a great mea-fure been forced to it by the Portuguese viceroy. 3. That the king of Portugal would do a generous act in restoring some of her Angolic dominions; but it would be more fo, were he to restore them all. 4. That as to her paying homage to him, neither her mind nor heart were base enough to confent to it; and that as she had refused the proposal while she lived among the Giagas, much more did she think herself above it now she was a Christian queen, and owed neither tribute nor homage to any but to the Supreme Power, from whom she had received both her being and her kingdom: That, nevertheless, if she could be convinced that there was any thing in her dominions that would be acceptable to his Portuguese majesty, she would voluntarily make him a present of it; and as to the rest of the articles, fuch was her defire of making a firm and lasting peace with them, that she should make no difficulty of confenting to them."

This answer was not altogether satisfactory to the viceroy; but the priest, finding it impossible to make any impression upon her mind, easily prevailed upon Articles of him to confent to the following terms. 1. " That the treaty. the river Lucalla should be the boundary between the dominions of the Portuguele and of Queen Zingha. 2. That neither side should thenceforth give any reception to the fugitive flaves of the other, but fend them back without any delay, together with the prifoners which had been taken during the last year. 3. That the queen should remain wholly free and exempt from all tribute and homage whatever, provided

fhe agreed to the other articles.'

These terms were at last signed by the queen and viceroy in the month of April 1657, and ratified by

the king of Portugal in the month of November the Angola. fame year.—The only difficulty the queen had concerning this treaty was with regard to the Giaga Colanda: and the manner in which she extricated herfelf from it, with her subsequent behaviour, cannot fail to give us an high idea of the mental abilities of this African heroine.

This Giagan chief, weary of the Portuguese yoke, Zingha's had retired from them, at the head of 1000 front fol-honourable diers, and a much greater number of flaves, fome behaviour. leagues beyond the river Lucalla, and put himself under the queen's protection. This she readily granted, as he was very able to be ferviceable to her in case the perfidious conduct of the Portuguese should oblige her to renew the war. She could not therefore but look upon it as unjust and dishonourable, to deliver up a brave chief who had devoted himself to her service, and whom she had taken under her special protection, to a nation with whose perfidy she was so well acquainted. To fave her honour, therefore, some time before the ratification of the treaty, the fent privately for the Giaga, and acquainted him with the demand of the Portuguese; telling him, at the same time, that though she doubted not of the viceroy's keeping his word, and forgiving his offence, yet she advised him to go out of her dominions, and fettle himfelf and his men in fome country diffant from the Portuguese frontiers; but forbade him, on pain of her highest displeasure, to commit the least outrage or hostility within their dominions.

The Giaga thanked her majesty, and seemed to acquiesce with her advice, but did not follow it. On the contrary, he had no fooner reached his fortrefs, than he fet himfelf about fortifying it in fuch a manner as looked rather like defiance than defence; and, having gathered a confiderable army, foon spread a general terror around him. Of this the Portuguese failed not to complain to the queen; who immediately marched against him, surprised and defeated his army; and he Defeats at himself being killed in the action, his head was cut off kills the G

and fent to the Portuguese. This was among the last memorable actions perform-da. ed by this famous queen; who, now finding herfelf unfit for the fatigues of war, contented herself (in 1658) with despatching an old experienced general against a neighbouring prince who had invaded her territories. He proved no less successful than herself, and quickly forced the aggressor to submit to her terms. She now Encourage gave herself up to study the best method of propagating Christian Christianity among her subjects; and for this purpose ty. fent a folemn embaffy to Rome, to pay homage to the Pope in her name, and to request a fresh supply of missionaries. To this letter she received an answer from his Holiness in 1662; and it was read in the church, that same year, in the most public and solemn manner. The day appointed was the 15th of July; on which she repaired to the church at the head of a numerous retinue, and having the letter hanging about her neck in a purse made of cloth of gold. The concourse was so great, that the church could not contain one half of the people, so that none were admitted but persons of rank. The father having fluished the mass, read the letter at

the altar in the Portuguese language; and the secretary

interpreted it in that of the country. The queen, who

had flood all the while it was reading, went towards

noble an-

fwer.

figned.

gola. the altar, and on her knees received it from the father: and having kiffed it, and fworn afresh upon the 53 gospel to continue in obedience to the church of Rome, monies kissed the letter again, put it into the purse, and recriving kined the letter again, put it into the purie, and re-erfrom turned to the palace amidst the shouts and acclamations Pope. of many thousands of her subjects. On that day she gave a magnificent treat to the Portuguese resident, and to all her court, in two great porticos, and she herself vouchfafed to eat after the European manner; that is, fitting on a stately elbow chair, with a high table before her, covered with the finest linen, and with dishes, plates, knives, and forks, all of filver gilt. She bestowed some largesses upon her chief officers, released a good number of flaves, and at night appeared at the head of her ladies of honour, both she and they dressed in the Amazonian manner. They performed a kind of combat, in which the queen, though upwards of eighty years of age, behaved with all the vigour and activity of a woman of thirty.

hadies. Her life, however, was not lengthened in proportion . to her vigour and activity: for in the month of September sne was seized with an inflammation in her throat; which, in December, having feized her breaft and lungs, she expired on the 17th of that month, and

was succeeded by her fister Barbara.

eded The deceased queen was buried with extraordinary r fifter pomp; and, out of regard to her, Barbara was inaugurated a fecond and third time, with the greatest pomp, and the most joyful acclamations.—She was a very zealous Christian, but wanted her sister's abilities, and had the misfortune of being in the decline of life, lame, and almost blind. Besides this, she had been married to a proud ill-natured husband, named Mona Zingha; who, though to her he owed all his fortune and advancement, being himfelf no more than the fon ty of of a flave, used her with such cruelty, even in the late is infoand queen's life, that she was obliged to take refuge in the ber. to fetch her. This so exasperated Queen Zingha, that she had well nigh ordered him to be cut in pieces before her face; but pardoned him at the request of Father Anthony, who probably knew he was privy to fome religious fecrets which he might, in case of such emergency, have disclosed. On Barbara's accession to the throne, however, he not only redoubled his cruelty to her, in hopes of getting the management of affairs entirely into his own hands, but invented accusations against Anthony himself, with a design to extirpate both him and his religion. He gave out that the late cuses queen had been poisoned by some favourite European TAn. dishes, with which Brother Ignatio used to regale her during her last illness; and attributed his wife's lameness and blindness to some forceries or charms used by the convent against her. He had even persuaded, or rather forced, his queen to consent that some of the finghillos or priefts should be brought to counter-charm her distemper.

Father Anthony, far from being intimidated at the accusations brought against him, repaired immediately to the palace; where he boldly reprimanded the queen for giving ear to these jugglers, threatening at the same time to leave her dominions, and carry off with him all the croffes, and other religious utenfils, from which alone they could have any benefit. The queen returned a very submissive answer; and promised to deliver up

:8

the counter-charms which she at that time had upon Angola. her, before funfet; which she accordingly did, and fent' them to the convent by the hands of her fecretary. This so exasperated her husband, and all the Giagan sect. that they refolved upon the destruction of all the priests and Europeans, and even the queen herfelf. This. however, was found improper to be attempted; and Mona Zingha was fo much chagrined at his difappointment, that he retired to his own estate; giving out, that he designed to meddle no more with state affairs; but, in reality, to concert measures for engrossing the fovereignty to himself, and to deprive his wife of her life and crown.

To accomplish his purpose, he sent a messenger to her, defiring her to repair to his house, where he had fomething of importance to communicate; but she declining the invitation by the advice of Father Anthony, he found himself disappointed, and begged leave to retire to a neighbouring province, which was under his government. He was again disappointed, and solved to the province of Metamba. The forbid to stir out of the province of Metamba. queen was, however, guilty of an error not long after, in fending Mona Zingha, at the head of an army, to quell a revolt on the frontiers. On his returning vic-Mona Zintorious, he thought himself strong enough to revive the gha revives the Gragan ancient Giagan rites, and therefore ordered 100 flaves intes; to be facrificed to the manes of the deceased queen. Though the queen was immediately apprifed of his intention, and despatched a messenger expressly commanding him to defift; yet Mona, by distributing some prefents, particularly some European wines, among the counsellors, effected his purpose with impunity. He did not forget to fend fome of this wine to Father Anthony: but to prevent fuspicion, presented him only with a small quantity, to be used, as he faid, at the mass; adding, and poithat if it proved agreeable, he would supply him with sons Father a larger quantity. The unsuspecting priest drank about Anthony. two glasses of it; and in about a quarter of an hour was feized with violent convultions in his bowels, and other fymptoms of being poisoned. By proper affistance, however, he recovered: yet so far was he disabled by this dofe, that he was obliged to abandon his mission.

The queen's infirmities in the mean time daily in-The Queen creafing, Mona Zingha was foon delivered from all fur-diesther opposition on her part, by her death, which happened on the 24th of March 1666. Upon this, Mona Zingha made all possible haste to get himself elected king; and immediately renounced the Christian religion, raifing a perfecution at the same time against its professors. He even wrote to the Portuguese viceroy, acquainting him with his having renounced Christianity, which he had only embraced out of complaifance to his queen, and with his defign to revive the Giagan rites. To show that he meant to be as good as his word, he Cruelties of ordered all the children under fix years of age, that Mona Zincould be found, to be facrificed in honour of their in-gha. fernal deities. He also recalled the singhillos, and heaped many favours upon them; so that they became entirely devoted to his purposes. He likewise caused. many of his subjects to be privately poisoned; and then gave out, that their unaccountable deaths were owing to their having abandoned the religion of their ancestors, and embraced Christianity; which he styled the religion of a parcel of familhed ilrangers, who through their extreme misery, had been forced to leave their native coun-

Angola try, and feek for a livelihood in the richest provinces of Africa.

> By these and such like stratagems he almost entirely extirpated Christianity, and any appearances of civilization which had been introduced among his subjects. His career, however, was stopped by Don John the princess Barbara's first husband, from whom she had been divorced on account of his having another wife. He foon compelled the usurper to fly into an island in the Coanza; but not having the precaution to reduce him entirely, Mona Zingha found means to retrieve his affairs, and at last defeated and killed Don John himself, by which he became master of the throne without any further opposition. He was no sooner re-established, than he began to purfue his butcheries with more fury than ever; when on a sudden, Don Francisco, the son of Don John, appeared at the head of an army in opposition to the usurper; and in the first engagement Mona Zingha being defeated and killed, Don Francisco became sole master of the empire.

63 He is defeated and killed.

the kings

guele.

terms of the alliance made by Queen Zingha with the Portuguese or not. These, however, have preserved their conquelts, and for some time they allowed the natives to choose a king for themselves, or rather they Low state of chose him for them, as we have already noticed. These kings enjoyed only a mere shadow of royalty; their whole grandeur confisting in being allowed to breed the Portupeacocks, and adorn themselves with their feathers, which was forbidden to their subjects under pain of perpetual flavery.—The last of these kings was named Ngola Sedesio, who, disliking an empty name of royalty, revolted from the Portuguese, and carried on a

It is not known whether this prince kept to the

long war with them; but being at last defeated and killed, his head was cut off, falted, and fent to Lifbon in pickle. After this the Portuguese seem not to have thought it safe to trust their Angolic subjects even with the name of a king of their own, but have vested the power entirely in their viceroy; but as to the extent of his dominions, and how matters stand between him and that race of Angolic princes who have preserved their

liberty, we are entirely in the dark.

When in its greatest splendour, the kingdom of Angola contained the 17 following provinces: Chessama, Sumbi, Benguela, Rimba, Sietta, High and Low Bembea, Temba, Oacco, Cabezzo, Lubolo, Loanda, Bengo, Danda, Mofiche, Higher and Lower Ilamba, Oraij, and Embacca. The provinces conquered by the Portuguese during the wars above mentioned were, Danda, Mosiche, Bengo, the Higher and Lower Ilamba, Oraij, Embacca, Benguela, Sietta, Cabezzo, Lubolo, and

Oacco.

Rivers.

Division

into pro-

Vinces.

The principal rivers are those already mentioned, viz. the Danda and Coanza. The Coanza is large, deep, and rapid. It empties itself into the Atlantic ocean about latitude 9° 20' S. twelve leagues fouth of Loando the capital of the kingdom. It is navigable for 150 miles, and abounds with variety of fish. It forms feveral islands, has fome cataracts, and one in particular which bears its name. As for its fource, and the length of ground it crosses from east to west before it comes to the Portuguese settlement, it is absolutely unknown, as well as the countries through which it runs. Its mouth, which runs between the capes Pal-

merino and Lego, is above a league wide; the northern shore is the deepest, and along which the vessels The fall of this river into the ocean is fo rapid, that the sea appears quite muddy for two or three leagues below it. Its mouth is not eafily perceived from the open sea, by reason of an island quite covered with high trees which lies just before it. The two principal islands formed by this river are called Massarder and Motchiamia. The one is fix leagues long, and about two miles broad: it is very fertile in maize, millet, and fome other grains, which are reaped at three different feafons of the year. It produces likewife vall quantities of manhioc, a root, of which they make a coarse kind of meal, which serves instead of bread. Here also grow great numbers of palm and other fruit trees of various kinds. The island of Motchiamia is four or five miles long, and one in breadth, mostly plain, and producing variety of roots and herbs. It likewise abounds in cattle; and there were formerly five or fix Portuguese families settled upon it, who drove a confiderable trade in these commodities, and likewise in slaves.

Concerning the river Danda we know little or nothing: only, that though its mouth is not above 70 or 80 miles distant from that of the Coanza, yet their distance grows so considerably wider as you penetrate further into the inlands, as to be much above twice if not thrice that space; though how much, is not exactly

The manners, religion, and drefs, &c. of the inhabitants, are much the fame with the Congoefe. See Congo.

Angola Pea, or Pigeon pea. See Cytisus.

ANGON, in the ancient military art, a kind of javelin used by the French. They darted it at a confiderable distance. The iron head of this weapon refembled a fleur-de-luce. It is the opinion of some writers, that the arms of France are not fleurs-de-luce, but the iron point of the angon or javelin of the ancient French.

ANGOR, among ancient physicians, a concentration of the natural heat; the consequence of which is a pain

of the head, palpitation, and fadness.

ANGOT, a province or kingdom of Abyffinia, formerly rich and fertile, but almost ruined by the Gallas, a wandering nation in the internal parts of Africa, who dispossessed the Abyssinian monarchs of all that

was worth possessing.

ANGOULESME, a city of France, the capital of the duchy of Angoumois, and the see of a bishop. It is feated on the top of a hill, furrounded with rocks, at the foot of which runs the river Charante. The inhabitants are faid to be about 8000, and to drive a considerable trade in paper, which is their manufacture.

E. Long. c. 10. N. Lat. 45. 39

ANGOUMOIS, a province of France, bounded on the north by Poitou, on the east by Limosin and Marche, on the fouth by Perigord, and on the west by Saintonge. Through this province run the rivers Touvre and Charante. This last is full of excellent fish; and though it often overflows its banks, it is so far from doing any damage, that it greatly enriches the foil. The Touvre is full of trouts. The air is generally warmer than at Paris, though the country is hilly. The

rours foil produces plenty of wheat, rye, oats, Spanish corn, apy. laffron, grapes, and all forts of fruits. Here are feveral 'iron mines, which yield a very good fort of iron.

ANGOURA, ANGORA, or ANGORI, a city of Afia, in Anatolia, formerly called Ancyra, and still full of remarkable antiquities, which are fo many marks of its ancient magnificence. It is at present one of the best cities in Anatolia; its streets are full of pillars and old marbles, among which are fome of porphyry and jasper. The greatest part of the pillars are smooth and cylindrical; fome are channelled spirally; but the most fingular are oval, with plate bands before and behind from the top to the bottom of the pedeltal. The houses are now made of clay, which is fometimes intermixed with fine pieces of maible. The walls of the city are low, with very mean battlements. The masonry of the walls is intermixed with pillars, architraves, capitals, and other ancient fragments, especially that of the towers and gates. The castle of Angora has a triple enclosure; and the walls are of large pieces of white marble, and a stone much like porphyry.

The basha of Angora has about 30 purses income; and there are here about 300 janizaries, under the command of a fardar. The Turks are faid to be 40,000, the Armenians 4000 or 5000, and the Greeks 600. The Armenians have feven churches, besides a monaflery, and the Greeks two. They breed the finest goats in the world; and their hair, which is of a dazzling white, is almost as fine as filk, and nine inches in length: it is worked into very fine stuffs, particularly camblet. All the inhabitants are employed in this manufacture. Several large caravans pass through this city to different places. E. Long. 32. 5. N. Lat. 39. 30. See ANCYRA.

ANGOY, a kingdom of Loango in Africa, bounded on the north by Cacongo, and on the fouth by Congo; from the former of which it is separated by the river Cabinda, and from the latter by the river Zaire. It is but of small extent; being only a vassal province of Cicongo, till the mani or prince, who had married a Portuguese's daughter, was persuaded by his father-in-law to make himself independent. This he effected at a favourable juncture, the king of Loango having but just before revolted from the king of Congo, and the king of Cacongo from the new king of Loango. The country is full of woods and thickets; and has no towns of any note, except one called Bomangoy, fituated on the north banks of the Zaire, and not far from its mouth. Its chief port is Cabinda, called also Kabenda, or Cubenda, fituated on the mouth of a river of the fame name about five leagues north of Cape Palmerino, on the north fide of the Zaire's mouth. The bay is very commodious for trade, or wooding and watering along the shore. It is flat and marshy in some places; but ascends gradually about three miles inland, and then forms itself into a ridge of hills. On the ascent of these is fituated a town belonging to the father-inlaw of the king above mentioned, where he constantly kept a flock of wood ready cut, to fell to foreign ships at an easy rate. From these wood piles, south-west along the bay, lie scattered a number of fishermen's huts, on each fide a small fresh water river which falls into the bay; and thence all the water for ships is brought in casks to the mouth of the river, which is so shallow, that even at full flood it can only be entered by Vol. II. Part I.

a yawl carrying a cask or two. The town stands on the round point of the bay looking to the wellward; and Angan the English have a factory on the fouth-west of the

The country round the bay is mostly barren; owing chiefly to the laziness of the inhabitants, which often occasions a scarcity of provisions. The wild beafts fwarm fo in the woods, that they destroy all the tame kinds; fo there are no cattle bred here but hogs. From the woods in this country some monkeys have been brought away, which in shape and stature resembled the human species. Civet cats abound here in great plenty. and parrots may be bought for three or four ordinary knives. The coasts abound so with oysters, that the failors quickly load their boats with them; they being found lying in great heaps like fmall rocks. The natives follow the occupation of fishing more than any other. They fish both on the sea and in the rivers, making use of drag nets, which have long canes fixed at equal diffances, instead of corks, to show when any fith is caught. These nets are made of a peculiar kind of root, which, after being beaten, may be spun like

The dress of the inhabitants is the same with that of the Congoefe. They allow polygamy, and the heft beloved wife hath the command of the rest; but is no less liable to be turned out, if the proves unfaithful. The ladies of the blood-royal have the privilege of choosing their husbands out of any, even the meaneth rank; and have even the power of life and death over them; as likewise over their paramours, if any of them are caught tripping: but the husbands are by no means entitled to expect the same fidelity from their royal ladies. Women of the lower rank are obliged, when they receive a stranger, to admit them for a night or two into their embraces. This obliged the missionaries, who travelled through this country, to give notice of their approach to any of their houses, that none of the scinale fex might enter within their doors .- Their religion confifts chiefly in a variety of superstitious customs; fuch as powdering their public and domestic idols with the dust of a kind of red wood, on the first day of the moon, and paying a kind of worship to that planer. If, on that night, it happens to finine clear and bright, they cry out, "Thus may I renew my life as thou doft;" but if the air is cloudy, they margine the many hath lost her virtue, and pay her no respect. We do not hear of their offering any facrifices to their idels; though they commonly confult them about the fuecefs of their enterprifes, thefts, or fuch like. The king at Congo still styles himself fovereign of Angoy; but the king of this little state pays neither tribute nor homage to any foreign power.

ANGRA, a city of Tercera one of the Azores; the capital, not only of that island, but of all the rell, and the refidence of the governor. It is feated or the fouth fide, near the middle of the longest diameter or the island, on the edge of the sea. The harbour is the only tolerable one in the whole island, being equally secured against storms and the efforts of an enemy. It is of the form of a crefcent; the extremities of which are defended by two high rocks, that run fo far into the sea as to render the entrance narrow, and easily covered by the batteries on each fide. From this harbour the town is faid to derive its name, the

Angra word Angra fignifying a creek, bay, or station for ship-" ping; and this is the only convenient one among all the Azores. The opening of the port is from the cast to the south-west; and, according to Frezier, it is not above four cables length in breadth, and not two of good bottom. Here ships may ride in great safety during the summer; but as soon as the winter begins, the storms are so furious, that the only safety for shipping is the putting to sea with all possible expedition. Happily, however, these storms are preceded by infallible figns, with which experience has made the inhabitants perfectly well acquainted. On these occasions the Pico. a high mountain in another of the Azores, is overcast with thick clouds, and grows exceedingly dark; but what they look upon as the most certain fign is the fluttering and chirping of flocks of birds round the city for fome days before the storm begins.

> The town is well built and populous, is the fee of a bithop, under the jurisdiction of the archbishop of Lifbon. It hath five parishes, a cathedral, four monasteries, as many nunneries, belides an inquilition and bishop's court, which extends its jurisdiction over all the Azores, Flores, and Corvo. It is furrounded by a good wall, a dry ditch of great depth and breadth, and defended by a strong castle rendered famous by the imprisonment of King Alphonso by his brother Peter in 1668. Though most of the public and private buildings have a good appearance externally, they are but indifferently furnished within; but for this poverty the Portuguele excuse themselves, by faying, that too much furniture would prove inconvenient in fo warm a climate.

> At Angra are kept the royal magazines for anchors, cables, fails, and other stores for the royal navy, or occassonally for merchantmen in great distress. All maritime affairs are under the inspection of an officer called Desembergrador, who hath subordinate officers and pilots for conducting ships into the harbour, or to proper watering places. The English, French, and Dutch, have each a conful refiding here, though the commerce of any of these nations with the Azores is very inconfiderable.

> ANGRIVARII, (Tacitus); a people of Germany, fituated between the Wefer and the Ems, and eastward reaching beyond the Wefer, as far as the Cherufci, on which fide they raifed a rampart (Tacitus); to the fouth, having the Tubantes on the Ems, and on the Weser where it bends to the forest Bacemis; to the well, the Ems and the confines of the Bructeri; and to the north, the territory of the Angrivarii lay between the Chamavi and Ansibarii. Ptolemy places them between the Cauchi and Suevi or Catti. Supposed now to contain a part of the county of Schaumburg, the half of the bishopric or principality of Minden: to the fouth, the greatest part of the bishopric of Ofnaburg, the north part of the country of Teclenburg, and a part of the county of Ravensberg. A trace of the name of the people still remains in the appellation Engern, a small town in the county of Ravensberg.

> ANGUILLA, one of the West India or Carribbee islands, lying in about 15° N. Lat. It has its name from its fnake-like form; and is about ten leagues in length and three in breadth. It was first discovered by the English in 1650, when it was filled with alligators and other noxious animals; but they, finding the foil

fruitful, and proper for raising tobacco and corn, settled Anguina a colony on it, and imported live cattle, which have fince multiplied exceedingly. But the colony not being Anguinum fettled under any public encouragement, each planter laboured for himself, and the island became a prey to every rapacious invader, which disheartened the inhabitants fo much, that all industry was lost among them. Their chief sufferings was from a party of wild Irish, who landed here after the Revolution, and treated them worse than any of the French pirates who had attacked them before. The people of Barbadoes, and other English Caribbees, knowing the value of the foil, several of them removed to Anguilla, where they remained for many years, and even carried on a profitable trade, though without any government either civil or ecclefialtical. In 1745, their militia, though not exceeding 100 men, defended a breaftwork against 1000 French who came to attack them; and at last obliged them to retire with the loss of 150 men, besides carrying off fome of their arms and colours as trophies of their victory. Since that time the inhabitants have subfifted moltly by farming; though they still plant sugar, and the island is said to be capable of great improvements.

ANGUINA. See TRICOSANTHES. ANGUILLIFORM, an appellation given by zoologists, not only to the different species of eels, but to other animals resembling them in shape.

ANGUINUM ovum, a fabulous kind of egg, faid to be produced by the faliva of a cluster of ferpents, and possessed of certain magical virtues. The superflition in respect to these was very prevalent among the ancient Britons, and there still remains a strong tradition of it in Wales. The account Pliny * gives of it * Lib. ziz. is as follows: " Præterea est ovorum genus in magna c. 3. "Galliarum fama, omiffum Græcis. Angues innume-" ri æftate convoluti, falivis faucium corporumque spu-" mis artifici complexu glomerantur; anguinum appel-" latur. Druidæ fibilis id dicunt in fublime jactari, " sagoque oportere intercipi, ne tellurem attingat? " profugere raptorem equo: serpentes enim insequi, "donec arceantur amnis alicujus interventu."-Of which the following may ferve as a translation: (from Mason's Carattacus; the person speaking, a Druid.)

But tell me yet From the grot of charms and spells, Where our matron fifter dwells, Brennus, has thy holy hand Safely brought the Druid wand, And the potent Adder-stone, Gender'd 'fore the autumnal moon ? When, in undulating twine, The foaming fnakes prolific join; When they hifs, and when they bear Their wond'rous egg aloof in air: Thence before to earth it fall, The Druid in his hallow'd pall, Receives the prize, And instant flies, Follow'd by the envenom'd brood, 'Till he cross the crystal flood.

This wondrous egg feems to be nothing more than: a bead of glass, used by the Druids as a charm to impose on the vulgar, whom they taught to believe, that the possessor would be fortunate in all his attempts, and that it would gain him the favour of the great.

Anguis.

KV. and

CXIX.

Our modern Druidesses (fays Mr Pennant, from whom we extract) give much the same account of the ovum anguinum, glain neidr, as the Welsh call it, or the adder gem, as the Roman philosopher does; but seem not to have so exalted an opinion of its powers, using it only to affilt children in cutting their teeth, or to cure the chincough, or to drive away an ague.

These beads are of a very rich blue colour; some plain, others freaked. For their figure, fee Plate XXXII.

fig. 22. No 1, 2, 3.

ANGUIS, or SNAKE, in zoology, a genus belonging to the order of amphibia ferpentes. The characters of the anguis are these: They are squamous or scaly in the belly and under the tail; without any See Plates fouta *. There are 15 species of the anguis, viz. 1. The cryx, a native of Britain and likewise of America, is about a span in length, and about the thicknels of a man's finger. One from Aberdeenshire, deferibed by Mr Pennant, was 15 inches long; tongue broad and forked; nostrils small, round, and placed near the tip of the nofe; eyes lodged in oblong fiffures above the angle of the mouth; belly of a bluish lead colour, marked with small white spots irregularly disposed: The rest of the body of a grayish brown, with three longitudinal dusky lines; one extending from the head along the back to the point of the tail; the others broader, and extending the whole length of the tides. It was entirely covered with small scales; largest on the upper part of the head. 2. The fragilis, blindworm, or flow worm, grows to about a foot in length, and to the thickness of a man's little singer: the irides are red; the head is small; the neck still more slender; from that part the body grows fuddenly, and continues of an equal bulk to the tail, which ends quite blunt. The colour of the back is cinerous, marked with very fmall lines composed of minute black specks: the sides are of a reddish cast; the belly dusky; both marked like the back. The tongue is broad and forky; the teeth are minute, but numerous; the scales small. The motion of this ferpent is flow, from which, and from the smallness of the eyes, are derived its name. It refembles the viper in the manner of producing its young, which are put forth alive. It is frequent with us in gardens and pastures, where it lives principally under ground feeding on worms. Like others of the genus, they lie torpid during winter, and are fometimes found in vast quantities twisted together. 3. The ventralis, or glass fnake of Catesby, has 127 squame on the belly, and 223 on the tail. The head is very small, and the tongue of a fingular form. The upper part of the body is of a colour blended brown and green, most regularly and elegantly spotted with yellow, the undermost part of which is brightest. The skin is very fmooth; and thining with small scales, more closely connected, and of a different structure from those of other ferpents. A fmall blow with a flick will cause the body to separate, not only at the place flruck, but at two or three other places, the muscles being articulated in a fingular manner quite through to the vertebra. They appear earlier in the spring than any other serpent, and are numerous in the fandy woods of Virginia and Carolina. They are generally faid to be harmlefs. . The jaculus, or dart fnake, is about three handbreadths long, and about the thickness of one's little finger. Its colour is a milky gray on the back, variegated with small black spots like so many eyes; and Angair on the belly it is perfectly white. The neck is wholly Angari black; and from that two milk-white streaks run the way along the back to the tail: the black spots also are each surrounded with a small circle of white. It has its name from its vibrating its body in the manner of a dart. It is a native of Egypt, Lihya, and the islands of the Mediterranean. 5. The quadrupes: The body of this species is cylindrical, with 14 or 15 longitudinal ash-coloured streaks; the teeth are extremely fmall; it has no ears: the feet are at a great distance from each other, very short, with five toes and small nails; but the toes are so minute, that they can hardly be numbered: It is a native of Java. 6. The bipes, is a native of the Indies; it has two short feet, with two toes, near the anus, In every scale of the bipes there is a brown point. 7. The meleagris, is likewife a native of the Indies; it has small teeth, but no ears. This species has a great resemblance to the former. 8. The colubrina, an inhabitant of Egypt, is beautifully variegated with pale and yellow colours. 9. The maculata, a native of America, is yellow, and interspersed with ash-coloured lines on the back: the head is small in proportion to the body. 10. The reticulata, a native of America, has brownish scales, with a white margin. 11. The ceraftes, with 200 fquamæ on the belly and 15 on the tail, is a native of Egypt. 12. The lumbricalis, a native of America, has 230 squamæ on the belly and 7 on the tail; its colour is a yellowish white. 13. The platura: The head is oblong and without teeth; the body is about a foot and a half long, black above and white below; the tail is about one-ninth of the length of the animal, much compressed or flatted, and variegated with black and white; the scales are roundish, small, not imbricated, but they cannot be numbered. 14. The laticanda, a native of Surinam: the tail is compressed, acute, pale, with brownish belts. 15. The scytale, a native of the Indies, with 220 squamæ on the belly and 13 on the tail. The head is fmall and oval, and the eyes are little; the body is eylindrical, about a foot and a half long, covered with oval obtufe scales: the tail is thick and obtufe like the head; its colour is white, interspersed with brownish rings; the margins of the scales are of an iron colour; and the top of the head is blue.-According to Linnæus none of this genus are poisonous.

ANGURIA, the WATER MELON: A genus of the diandria order, belonging to the monoccia class of plants; and in the natural method ranking under the 34th order, Cucurbitacea. The effential characters are these: The male calyx is quinquesid, and the corolla quinquepetalous: The female calyx and corolla the same: The pericarpium is a pome beneath, with

two cells: The feeds are numerous.

Species. Of this genus, Linnaus reckons three species, the trilobata, pedata, and trifoliata; but only one is known in this country, by the name of Citrul. The fruit is cultivated in Spain, Portugal, Italy, and other warm countries of Europe; as also in Africa, Asia, and America; where it is effeemed on account of its wholefome, cooling quality; but in Britain it is held in little estimation.

Culture. To have this fruit good, some seeds must be procured of three or four years old; new feeds being apt to produce vigorous plants, which are feldom

os fo fruitful as those of a moderate strength. These are to be fown in the hotbed for early cucumbers. Some inhalt. wew dung is to be prepared in the beginning of February, which should be thrown in a heap to heat, as is practifed for early cucumbers. The bed is then to be made in the same manner as for the musk melon, covering the dung about five inches thick with loamy earth; but as thefe plants require much more room than either cucumbers or common melons, there should be but one plant put into a three-light frame. A hill of the fame loamy earth should therefore be raised a foot and a half high, in the middle light of each frame; into which, when the bed is of a proper temper for heat, the plants should be carefully planted, observing to water and shade them until they have taken good root. As to other particulars, their management differs very little from that of the musle-melon: only they must frequently have fresh air admitted to them; and, when the nights are cold, the glaffes must be covered with mats to keep the beds warm.

ANGUS, a district of the county of FORFAR in Scotland. It was an earldom belonging to the Douglasses, now extinct.

ANGUSTICLAVIA, in Roman antiquity, a tunica embroidered with little purple studs. It was worn by the Roman knights, as the laticlavia was by the fenators.

ANHALT, a principality of Germany, in the circle of Upper Saxony, is a long narrow tract, fituated for the most part betwixt the rivers Elbe and Saal, about 90 miles in length from caft to west, but of unequal breadth, the greatest being on the cast side, which is The house of Anhalt, from whence but 35 miles. the electors of Saxony and Brandenburg are faid to derive their original, is a very ancient and honourable family. The best genealogists deduce their origin from Berenthobaldus, who made war upon the Thurmgians in the fixth century: it has produced many princes who make a great figure in the German hiftory. Joachun Erneft, who died in 1586, left five fons, who divided the principality airong them. All of them having children, and being of equal authority, they unammorfly agreed to fobmit to the eldeft of the family, who has the supreme government, which is Anhalt D.G.u. The others are, Anhalt Beinburg, Anhalt S. baumburg, Anhalt Grethen, and Anhalt Zerbft. The Saxons acknowledge that the inhabitants of thefe little independent fovereignties live in the land of milk and honey. These petty princes possess lands sufficient for their expences, the revenues being reckoned about half a million of dollars. The tax on lands is four per cent. which, rating them at 20 years purchase, is not quite one shilling in the pound. Upon an emergency the fubjects are able to raife half a million extraordinary. The towns in these little states are not so numerous in proportion to the extent of country as in Saxony, but better peopled. It is bounded on the S. by the county of Mansfeld, on the W. by the duchy of Halberstadt, on the E. by the duchy of Saxony, and on the N. by the duchy of Magdeburg. It abounds in corn, and is watered by the Sadle and Mulda; its principal trade is in beer.

ANHELATIO, or Annelitus, among physicians, a shortness of breath.

ANHOLT, an island of Denmark, in North Jut-

land, lying in the Categat, eight miles from the coast Anhelatio of Jutland, ten from Secland, and seven from Halland. It is dangerous for seamen, for which reason there is a light-house.

ANIAN, the name of a strait formerly supposed to lie between the north-east of Asia and the northwest of America; but now found to exist only in ima-

Anian is also the name of a barren sandy desert lying on the east coast of Africa. It is so excessively hot and otherwise inhospitable, that it contains but very few inhabitants, except some wandering Arabs who live in camps.

ANIELLO, or Massaniello. See History of NAPLES.

ANJENGO, a small town and factory, with a fort, on the coast of Malabar, in the peninsula on this side the Ganges, belonging to the East India Company. The fort is small, but neat and strong; it is a square with four bastions, having eight guns mounted on each, carrying a ball of 18 pounds. Two of these bastions face the fea, the other two the country. Befides thefe, there is a line of 18 or 20 guns pointing towards the fea, of 18 and 24 pounders. About a pittel that from the back of the fort runs a river, which, belides being a fecurity to the factory, adds much to the agreeable fituation of the place. This river has its fource in fome diffant mountains; and, descending in a course from the north and east, it afterwards turns in feveral pleasing meanders fo far to the west as to wash the bottom of our factory's garden, and at last winding to the fouth, it empties itself into the sea. Several beautiful small islands too, which are washed by its current, diversify the scenery, and greatly heighten the beauty of the This fettlement fupplies our East India prospect. Company with pepper; and its fituation is also very convenient for giving proper intelligence to our ships touching here from Europe, or from any part of India. E. Long. 76. 1. N. Lat. 7. 0.

ANIL, in botany, a synonyme of a species of in-

digofera. See Indigofera.

ANIMA, among divines and naturalists, denotes the foul, or principle of life, in animals. See Soul.

Anima, among chemists, denotes the volatile or spirituous parts of bodies.

Anima Hepatis, is a name by which some call sal martis or falt of iron, on account of its supposed ef-

ficacy in difeases of the liver.

ANIMA Mundi, a certain pure ethereal substance or spirit, diffused, according to many of the ancient philosophers, through the mass of the world, informing, actuating, and uniting the divers parts thereof into one great, perfect, organical, and vital body or animal. Plato treats at large of the wuxn TH MOOPHH, in his Timeus; and is even supposed to be the author of the dogma; yet are interpreters much at a loss about his meaning. Aristotle, however, taking it in the common and obvious sense, strenuously opposes it. The modern Platonists explain their master's anima mundi by a certain universal cthereal spirit, which in the heavens exists perfectly pure, as retaining its proper nature; but on earth pervading elementary bodies, and intimately mixing with all the minute atoms therof, it affumes fomewhat of their nature, and becomes of a peculiar kind .- So the poet:

Spiritus intus alit, totosque infusa per artus Mens agitat molem, et magno se corpore miscet.

They add, that this anima mundi, which more immediately resides in the celestial regions as its proper seat, moves and governs the heavens in fuch a manner, as that the heavens themselves first received their existence from the fecundity of the same spirit: for that this anima, being the primary fource of life, everywhere breathed a fpirit like itself, by virtue whereof various kinds of things were framed conformable to the divine

Anima Saturni, a white powder obtained by pouring diffilled vinegar on litharge, of confiderable use in enamelling. See ENAMEL.

ANIMADVERSION, in matters of literature, is used to fignify, sometimes correction, sometimes remarks upon a book, &c. and fometimes a ferious confideration upon any point.

ANIMAL, in natural history, an organized and living body, which is also endowed with sensation: thus, nunerals are faid to grow or increase, plants to grow and live, but animals alone to have fenfation.

It is this property of fenfation alone that can be deemed the effential characteristic of an animal; and by which the animal and vegetable kingdoms feem to he fo effentially feparated, that we cannot even imagine the least approximation of the one to the other. Those naturalists, indeed, who have supposed the distinction between animals and vegetables to confift in any thing else than what we have already mentioned, have found themselves greatly embarrassed; and have generally agreed, that it was extremely difficult, if not impossible, to fettle the boundaries between the animal and vegetable kingdoms. But this difficulty will be easily feen to arise from their taking the characteristic marks of the animal kingdom, from fomething that was evidently common to both. Thus Boerhaave attempted to diffinguish an animal from a vegetable, by the former having a mouth, which the latter has not: but here, as the mouth of an animal is only the instrument by which nourishment is conveyed to its body, it is evident that this can be no effential distinction, because vegetables also require nourishment, and have inftruments proper for conveying it into their bodies; and where the end is the same, a difference in the means can never be effential. The fixing the difference in an animal's having a gula, stomach, and intestines, as is done by Dr Tyson, is as little to the purpose.

The power of moving from one place to another, hath by many been thought to constitute their difference; and indeed, in most cases, it is the obvious mark by which we diffinguish an animal from a vegetable: but Lord Kames hath given feveral very curious instances of the locomotive power of plants; some of which, as he fays, would do honour to an animal.-"Upon the slightest touch, the sensitive plant shrinks back and folds up its leaves, similar to a snail; which on the flightest touch retires within its shell. A new species of the fensitive plant hath been lately discovered. See Dion EA. If a fly perch upon one of its flower leaves, it closes instantly, and crushes the infect to death. There is not an article in botany more admirable than a contrivance, visible in many plants, to take advantage of good weather, and to protect themselves against bad. They open and close their flowers and leaves in different circumstances : some close before sunset, some Anim after: fome open to receive rain, fome close to avoid The petals of many flowers expand in the funt but contract at night, or on the approach of rain. After the feeds are fecundated, the petals no longer contract. All the trefoils may serve as a barometer to the husbandman; they always contract their leaves on an impending from. Some plants follow the fun, others turn from it. Many plants, on the fun's recess, vary the position of their leaves, which is styled the fleep of plants. A fingular plant + was lately discovered in + A spec

Bengal. Its leaves are in continual motion all day of the H. long; but when night approaches, they fall down from dyfarum. I that artis

an erect posture to rest.

"A plant has a power of directing its roots for procuring food. The red whortleberry, a low evergreen plant, grows naturally on the tops of our highest hills, among stones and gravel. This shrub was planted in an edging to a rich border, under a fruit wall. In two or three years, it overran the adjoining deep laid gravel walk; and feemed to fly from the border, in which not a fingle runner appeared. An effort to come at food in a bad fituation, is extremely remarkable in the following instance: Among the ruins of Newabbey, formerly a monastery in Galloway, there grows on the top of a wall a plane tree about 20 feet high. Straitened for nourifhment in that barren fituation, it feveral years ago directed roots down the fide of the wall, till they reached the ground ten feet below; and now the nourifliment it afforded to those roots during the time of their descending is amply repaid, having every year fince that time made vigorous shoots. From the top of the wall to the furface of the earth, their roots have not thrown out a fingle fibre; but are now united in a

"Plants, when forced from their natural polition, are endowed with a power to reflore themselves. A hop plant, twilling round a flick, directs its course from fouth to well, as the fun does. Untwish it, and the it in the opposite direction: it dies. Leave it lovie in the wrong direction: it recovers its natural direction in a fingle night. Twift a branch of a tree fo as to invert its leaves, and fix it in that position: if left in any degree loofe, it untwifts itfelf gradually, till the leaves be reflored to their natural polition. What better can an animal do for its welfare? A root of a tree meeting with a ditch in its progress, is laid open to the air. What follows? It alters its course like a rational being, dips into the ground, furrounds the ditch, rifes on the opposite side to its wonted distance from the furface, and then proceeds in its original direction. Lay a wet fponge near a root laid open to the air; the root will direct its course to the sponge. Change the place of the sponge; the root varies its direction. Thrust a pole into the ground at a moderate diflance from a scandent plant: the plant directs its course to the pole, lays hold of it, and rifes on it to its natural height. A honeyfuckle proceeds in its courfe, till it be too long for supporting its weight; and then strengthens itself by shooting into a spiral. If it meet with another plant of the fame kind, they coalefee for mutual support; the one screwing to the right, the other to the left. If a honeyfuckle twig meets with a dead branch, it ferews from the right to the left. The claspers of briony shoot into a spiral, and lay hold of whatever comes in their way

for support. If, after completing a spiral of three rounds, they meet with nothing, they try again by altering their course."-

By comparing these and other instances of seeming voluntary motion in plants, with that share of life wherewith some of the inferior kinds of animals are endowed, we can scarce hesitate at ascribing the superiority to the former; that is, putting fensation out of the question. Muscles, for instance, are fixed to one place as much as plants are: nor have they any power of motion, besides that of opening and shutting their shells: and in this respect they have no superiority over the motion of the fensitive plant; nor doth their action difcover more fagacity, or even fo much, as the roots of

the plane tree mentioned by Lord Kames.

Mr Buffon, who feems to be desirous of confounding the animal and vegetable kingdoms, denies sensation to be any essential distinction. " Sensation (says he) more effentially diftinguishes animals from vegetables: but fensation is a complex idea, and requires fome explication. For if fensation implied no more than motion confequent upon a stroke or an impulse, the scritive plant enjoys this power. But if, by sensation, we mean the faculty of perceiving and comparing ideas, it is uncertain whether brute animals are endowed with it. If it should be allowed to dogs, elephants, &c. whose actions feem to proceed from motives similar to those by which men are actuated, it must be denied to many species of animals, particularly to those which appear not to possess the faculty of progressive motion. If the fensation of an oyster, for example, differed only in

" From this investigation we are led to conclude, that there is no absolute and essential distinction between the animal and vegetable kingdoms; but that nature proceeds, by imperceptible degrees, from the most perfect to the most imperfect animal, and from that to the vegetables; and the fresh water polypus may be regarded as the last of animals and the first of plants."

degree from that of a dog; why do we not ascribe the

fame fensation to vegetables, though in a degree still

inferior? This diffinction, therefore, between the ani-

mal and vegetable, is neither fufficiently general nor

determined.

It were to be wished, that philosophers would on fome occasions consider, that a subject may be dark as well on account of their inability to fee, as when it really affords no light. Our author boldly concludes, that there is no effential difference between a plant and an animal, because we ascribe sensation to an oyster, and none to the fensitive plant; but we ought to remember, that though we cannot perceive a distinction, it may nevertheless exist. ... Before Mr Busson, therefore, had concluded in this manner, he ought to have proved that fome vegetables were endowed with fenfation.

It is no doubt, however, as much incumbent on those who take the contrary fide of the question, to prove that vegetables are not endowed with fenfation, as it was incumbent on Mr Buffon to have proved that they are. But a little attention will show us, that the difficulty here proceeds entirely from our inability to fee the principle of fensation. We perceive this principle in ourselves, but no man can perceive it in another. Why then does every individual of mankind conclude that his neighbour has the fame fenfations with himfelf? It can only be from analogy. Every man perceives his neighbour formed in a manner similar to himself; Animal. he acts in a fimilar manner on fimilar occasions, &c. Just fo it is with brute animals. It is no more doubtful that they have fenfations, than that we have them ourselves. If a man is wounded with a knife, for instance, he expresses a sense of pain, and endeavours to avoid a repetition of the injury. Wound a dog in the fame manner, he will also express a sense of pain; and, if you offer to strike him again, will endeavour to escape, before he feels the stroke. To conclude here, that the action of the dog proceeded from a principle different from that of the man, would be absurd and unphilosophical to the last degree,

We must further take notice, that there are sensations effentially diffinct from one another; and in proportion as an animal is endowed with more or fewer of thefe different species, it is more or less perfect as an animal: but, as long as one of them remains, it makes not the least approach to the vegetable kingdom; and, when they are all taken away, is so far from becoming a vegetable, that it is only a mass of dead matter. The senses of a perfect animal, for instance, are five in num-Take away one of them, suppose fight; he becomes then a less perfect animal, but is as unlike a vegetable as before. Suppose him next deprived of hearing: his refemblance to a vegetable would be as little as before; because a vegetable can neither feel, talle, nor fmell, and we suppose him still to enjoy these three fenses. Let us, lastly, suppose him endowed only with the fense of feeling, which, however, feems to include that of taste, and he is no more a vegetable than formerly, but only an imperfect animal. If this fense is then taken away, we connect him not with the vegetable kingdom, but with what Mr Buffon calls brute matter. It is to this kingdom, and not to the vegetable, that animals plainly approximate as they descend. Indeed, to suppose an approximation between the vegetable and animal kingdoms, is very abfurd: for, at that rate, the most imperfect animal ought to be the most perfect plant; but we observe no such thing. All animals, from the highest to the lowest, are possessed of vegetable life; and that, as far as we can perceive, in an equal degree, whether the animal life is perfect or imperfect: nor doth there feem to be the smallest connexion between the highest degree of vegetation and the lowest degree of fensation. Though all animals, therefore, are possessed of vegetable life, these two seem to be as perfectly distinct and incommensurate to one another as any two things we can possibly imagine.

The power of vegetation, for instance, is as perfect in an onion or leek, as in a dog, an elephant, or a man: and yet, though you threaten a leek or an onion ever fo much, it pays no regard to your words, as a dog would do; nor, though you wound it, does it avoid a fecond stroke. It is this principle of felf preservation in all animals, which, being the most powerful one in their nature, is generally taken, and with very good reason, as the true characteristic of animal life. principle is undoubtedly a confequence of fensation; and as it is never observed to take place in vegetables, we have a right to fay that the foundation of it, namely fensation, belongs not to them. There is no animal, which makes any motion in confequence of external impulse where danger is threatened, but what puts itself in a posture of defence; but no vegetable what-

nimal ever does so. A muscle, when it is touched, immedi-- ately shuts its shell; and as this action puts it in a state of defence, we conclude that it proceeded from the principle of felf-preservation. When the sensitive plant contracts from a touch, it is no more in a state of defence than before; for whatever would have destroyed it in its expanded state, will also do it in its contracted flate. We conclude, therefore, that the motion of the fensitive plant proceeds only from a certain property called by physicians irritability; and which, though our bodies possess it in an eminent degree, is a characteristic neither of animal nor vegetable life, but belongs to us in common with brute matter. It is certain, that an electrified filk thread shows a much greater variety of motions than any fenfitive plant. If a bit of filk thread is dropt on an electrified metal plate, it immediately ercets itself; spreads out the small fibres like arms; and, if not detained, will fly off. If a finger is brought near it, the thread feems greedily to catch at it. If a candle approaches, it clasps close to the plate, as if afraid of it.—Why do we not conclude that the thread in this case is really afraid of the candle? For this plain reason, That its seeming slight is not to get away from the candle, but to get towards the electrified metal; and, if allowed to remain there, will fuffer itself to be burnt without offering to stir .- The sensitive plant, in like manner, after it has contracted, will fuffer itself to be cut in pieces, without making the least effort to escape. The case is not so with the meanest animal. An hedgehog, when alarmed, draws its body together, and expands its prickles, thereby putting itself in a posture of defence. Throw it into water; and the same principle of self-preservation prompts it to expand its body and swim. A snail, when touched, withdraws itself into its shell; but if a little quicklime is iprinkled upon it, so that its shell is no longer a place of fafety, it is thrown into agonies, and endeavours to avail itscif of its locomotive power in order to escape the danger. In muscles and oysters, indeed, we cannot observe this principle of self-preservation so strongly, as nature has deprived them of the power of progreflive motion: but, as we observe them constantly to use the means which nature has given them for felf-prefervation, we can have no reason to think that they are destitute of that principle upon which it is founded.

> But there is no need of arguments drawn from the inferior creation. We ourselves are possessed both of the animal and vegetable life, and certainly must know whether there is any connexion between vegetation and fenfation or not .- We are conscious that we exist; that we hear, see, &c.: but of our vegetation we are absolutely unconscious. We feel a pleasure, for instance, in gratifying the calls of hunger and thirst.; but, of the process by which our aliment is formed into chyle, the chyle mixed with the blood, the circulation of that fluid, and the separation of all the humours from it, we are altogether ignorant. If we then, who are more perfect than other vegetables, are útterly infentible of our own vegetable life, why should we imagine that the less perfcct vegetables are fensible of it?

> To illustrate our reasoning here by an example.-The direction of the roots of the plane tree mentioned by Lord Kames, shows as much sagacity, if we are to look only to the outward action, as can be observed in any motion of the most perfect animal whatever; ne-

vertheless, we have not the least suspicion, either that Animal the tree faw the ground at a distance, or that it was informed of its being there by the rest of its roots. If a wound is made in the body of a man, and a loss of substance is to be repaired, the same fagacity will be observed in the arrangement of the fibres, not only as if they were animated, but they will dispose of themfelves feemingly with a degree of wilden far fuperior to what we have any idea of; yet this is done without our having the least knowledge either how it is done, or of its being done at all. We have therefore in ourselves a demonstration, that vegetable life acts without knowing what it does: and if vegetables are ignorant of their most fagacious actions, why should we suspect that they have a fenfation, let it be ever so obscure, of any of their inferior ones, fuch as contracting from a touch, turning towards the fun, or advancing to meet a pole?

Thus we may easily give Mr Buffon a reason why we ascribe sensation to an oyster, and none to a vegetable; namely, because we perceive the vegetable do nothing but what is also performed in our own bodies, without our having the least fensation of it; whereas an oyster puts itself in a defensive posture on the approach of danger; and this being an action similar to our own upon a like occasion, we conclude that it proceeds from the same principle of sensation. Here it may also be observed, that though the inferior animals are deficient in the number, they are by no means fo in the acuteness of their sensations; on the contrary, though a muscle or an oyster is probably endowed with no other fense than that of feeling, yet this fense is so exquisite, that it will contract upon the slightest touch. fuch as we would be altogether infensible of.

As to that power of contractility, or irritability, which is observed in some plants; our folids have it, when deprived both of vegetable and animal life: for a muscle, cut out of a living body, will continue to contract, if it is irritated by pricking it, after it has nei-

ther fensation nor vegetation.

A very good moral reason may also be adduced why we do not believe vegetables to be endowed with fenfation .- Had they been fo, we must suppose them to fuffer pain when they are cut or destroyed; and, if so, what an unhappy state must they be in, who have not the least power to avoid the injuries daily offered them? In fact, the goodness of the Deity is very conspicuous in not giving to vegetables the same sensations as to animals; and, as he hath given them no means of defence, though we had not been told it by himfelf, we might have known that he gave them for food to animals; and, in this case, to have endowed them with fensation would have been a piece of cruelty. Though animals without number prey upon one another, yet all of them have some means of defence; from whence we may justly conclude, that their mutual destruction was not an original appointment of the Creator, but what he forefaw would happen in a course of time, and which he therefore gave every one of them fome means of guarding against. It may no doubt be here objected, that the giving some means of self-defence to every animal cannot be reckoned a fufficient proof that it was not the original delign of the Creator that they should be destroyed, seeing these means are not always effectual for their preservation.—This objection, how-

simul. ever, cannot be completely obviated without a folution of the question concerning the origin of evil among the works of a perfectly good Being. But whatever difficulty there may be in folving this question, it is certain, that, as fome means of felf-defence is given to every animal, it has been the original defign of the Creator, that in all cases one species of animals should not be destroyed at the pleasure of any other species; and as no means of felf-defence is given to any vegetable, it is plain that they have been destined for a prey to every species of animals that had access to them. Philosophers have infilted much on the necessity of one animal's devouring another, that there might be room fusficient for all; but this, so far from being a system worthy of the divine wifdom, feems to us to be a reflection upon it, as if the Author of nature could not have found means to preferve the life of one part of his creatures, without the destruction and misery of the rest. The facred writings leave us at no loss to fee how this carnivorous difposition came in; and, in the next world, this piece of perfection (as the fanguinary philofophers above mentioned would have it to be) feems to be left out; for there, it is faid, " They shall not hurt " nor deflroy; the lion shall cat straw like the ox, and " there shall be no more pain."

> When speaking of the food of plants, we took occafion to mention a certain power, totally different from that of attraction or repullion, by which the food of a plant, after it was attracted, or otherwise brought to it, was affimilated to its fubstance. This power which we there diftinguish by the name of transmutation, belongs in a more eminent degree to animals. The alimentary fubiliance is changed into two kinds of matter. (1.) An excrementitious one, which passes off through the intestines; and (2.) A fluid, which is the direct pabulum of the animal. Different fubliances, however, are not equally changeable by this process. The human flomach is not capable of acting upon any animal fubiliance till it has loft its vital principle: the Homachs of fome animals cannot act upon creatures of their own species: some have an apparatus for grinding their food after it is swallowed, &c. and there are no animals but what are subject to death by taking certain fubiliances into their flomach. Some fubiliances alfo, though they reful the action of the stomach, and pals unchanged into the fystem, produce no bad effects. Thus, madder will turn the bones of animals red; rhubarb will communicate its purgative nature to the milk, and its deep yellow colour to the urine.—All these changes, however, feem to belong to the vegetative part of our fystem: for as every one of them are performed without our knowledge of the manner how; and not only fo, but while we are absolutely unconfcious of their being done; we can have no reason to suppose, that the animal life, properly so called, is at all connected with them, any farther than as they are at present the means of preserving the creature alive, and making the connexion betweet the principle of life and this visible creation.

> The description and classing of animals make a confiderable part of Natural History, known by the name of Zoology. See the article Zoology.

ANIMAL, used adjectively, denotes any thing belonging to, or partaking of, the nature of animals. Thus, animal actions, those that are peculiar to animals; such are fenfation and mufcular motion.

AKIMAI-Flower, in zoology, a-name given to feveral species of animals belonging to the genus of ACTINIA of Linneus. They have likewise been diflinguished by the names of Urtica Marina, or Scanettle, from their supposed property of stinging; and Sea-unemone, from their claws or tentacles being difposed in regular circles, and tinged with a variety of bright lively colours, refembling the petals of some of our most beautiful flowers. As to one species particularly, mentioned by Abbé Diequemarre, (Phil. Tranf. for 1773, art. 37.) the purelt white, carmine, and ultramarine, are faid to be fearce fusicient to express their brilliancy. The bodies of some of them are hemispherical, of others cylindrical, and of others shaped Their substance likewise differs; some are like a fig. stiff and gelatinous, others sleshy and muscular; but all of them are capable of altering their figure when they extend their bodies and claws in fearch of food. They are found in many of the rocky coasts of the West India islands, and likewise on some parts of the coast of England.

They have only one opening, which is in the centre of the uppermost part of the animal; round this are placed rows of fleshy claws; this opening is the mouth of the animal, and is capable of great extension. The animals themselves, though exceedingly voracious, will bear long fasting. They may be preserved alive a whole year, or perhaps longer, in a vessel of sea-water, without any visible food; but, when food is presented, one of them will fuccessively devour two muscles in their shells, or even swallow a whole crab as large as a hen's egg. In a day or two the crab-shell is voided at the mouth, perfectly cleared of all the meat. The muscle shells are likewise discharged whole, with the two shells joined together, but entirely empty, fo that not the least particle of fish is to be perceived on opening them. An anemone of one species will even swallow an individual of another species; but after retaining it ten or twelve hours, will through it up alive and uninjured. Through this opening also it produces its young ones alive, already furnished with little claws, which, as soon as they fix themselves, they begin to extend in search of food.

One of the extremities of the fea-anemone refembles, as we have faid, the outward leaves of that flower; while its limbs are not unlike the shag or inner part of it. By the other extremity it fixes itself, as by a sucker, to the rocks or flones lying in the fand; but it is not totally deprived of the power of progressive motion, as it can shift its situation, though very slowly.

A particular species of animal-flowers has been found in some of the islands ceded to Britain at the last treaty of peace with France; and the following account of them was published in the Philosophical Transactions, Vol. 57. by Mr Ellis, in a letter to Lord Hillsborough.

"This compound animal, which is of a tender fleshy fubstance, consists of many tubular bodies swelling gently towards the upper part, and ending like a bulb imal

or very small onion: on the top of each is its mouth, furrounded by one or two rows of tentacles, or claws, which when contracted look like circles of beads.

"The lower part of all thefe bodies have a communication with a firm fleshy wrinkled tube, which flicks fast to the rocks, and fends forth other fleshy tubes, which creep along them in various directions. These are full of different sizes of these remarkable animals, which rife up irregularly in groups near to one another.

"This adhering tube, that secures them fast to the rock, or shelly bottom, is worthy of our notice. The knobs that we observe, are formed in several parts of it by its infinuating itself into the inequalities of the coral rock, or by grasping pieces of shells, part of which still remain in it, with the sleshy substance grown over them.

"This shows us the instinct of nature, that directs these animals to preserve themselves from the violence of the waves, not unlike the anchoring of muscles, by their fine filken filaments that end in fuckers; or rather like the shelly basis of the serpula, or worm shell, the tree oyster, and the slipper barnacle, &c. whose bafes conform to the shape of whatever substance they fix themselves to, grasping it fast with their testaceous claws, to withfland the fury of a ftorm.

"When we view the infide of this animal diffected." lengthwife, we find like a little tube leading from the mouth to the stomach, from whence there rise eight wrinkled finall guts, in a circular order, with a yellowish soft substance in them; these bend over in the form of arches towards the lower part of the bulb, from whence they may be traced downwards, to the narrow part of the upright tube, till they come to the fleshy adhering tube, where some of them may be perceived entering into a papilla, or the beginning of an animal of the like kind, most probably to convey it nourishment till it is provided with claws; the remaining part of these stender guts are continued on in the fleshy tube, without doubt, for the same purpose of producing and supporting more young ones from the fame common parent.

"The many longitudinal fibres that we discover lying parallel to each other, on the infide of the femitransparent skin are all inserted in the several claws round the animal's mouth, and are plainly the tendons of the muscles for moving and directing the claws at the will of the animal; these may be likewise traced down to the adhering tube.

"As this specimen has been preserved in spirits, the colour of the animal, when living, cannot be certainly known; it is at present of a pale yellowish brown.

"With regard to its name, it may be called Adinia

fociata, or the Clufter Animal flower."

Vol. II. Part 1.

The Abbé Dicquemarre, by many curious, though cruel, experiments related in the Phil. Trans. for 1773, has shown that these animals possess, in a most extraordinary degree, the power of reproduction; fo that scarce any thing more is necessary to produce as many fea anemonies as we please, than to cut a single one into as many pieces. A fea anemone being cut in two by a fection through the body, that part, where the limbs and mouth are placed, ate a piece of a muscle offered to it foon after the operation, and continued to feed and grow daily for three months after. The food

fometimes passed through the animal; but was gene- Animal rally thrown up again, confiderably changed, as in the Flower. perfect fea anomene. In about two months, two rows of limbs were perceived growing out of the part where the incision was made. On offering food to this new mouth, it was laid hold of and caten; and the limbs continually increasing, the animal gradually became as perfect as those which had never been cut. In some instances, however, he found, that, when one of these creatures was cut through, new limbs would be produced from the cut place, those at the mouth remaining as before; fo that a monstrous animal was the consequence, having two mouths, and feeding at both ends. Having put some of them into a pan of water, fet over a flow fire, he found that they loft their life at 50 degrees of Reaumur's thermometer. To avoid the imputation of cruelty in these experiments, the author argues the favourable confequences that have attended his operations on the fea anemonies which have been so fortunate as to fall into his hands; as he hath not only multiplied their existence, but also renewed their youth; which last, he adds, " is findly no fmall advantage."

In Hughes's Natural History of Barbadoes, an account is also given of several species of animal slowers. They are there described as only found in a bason in one particular cave; and of the most remarkable species mentioned by him we have the following deferration.

"In the middle of the bason, there is a fixed stone, or rock, which is always under water. Round its fides, at different depths, feldom exceeding 18 mehes, are feen, at all times of the year, issuing out of little holes, certain substances that have the appearance of fine radiated flowers, of a pale yellow, or a bright fraw colour, flightly tinged with green, having a circular border of thickfet petals, about the fize of, and much refembling, those of a fingle garden marigold, except that the whole of this feeming flower is narrower at the discus, or setting on of the leaves, than any flower of that kind.

"I have attempted to pluck one of these from the rock, to which they are always fixed; but never could effect it: for as foon as my fingers came within two or three inches of it, it would immediately contract close together its yellow border, and shrink back into the hole of the rock; but if left undiffurbed for about four minutes, it would come gradually in fight, expanding, though at first very cautiously, its seeming leaves, till at last it appeared in its former bloom. However, it would again recoil, with a furprifing quickness when my hand came within a small distance of it. Having tried the fame experiment by attempting to touch it with my cane, and a small slender rod, the effect was the same.

"Though I could not by any means contrive to take or pluck from the rock one of these animals entire; yet I once cut off (with a knife which I had held for a long time out of fight, near the mouth of a hole out of which one of these animals appeared) two of thefe feeming leaves. Thefe, when out of the water, retained their shape and colour; but, being composed of a membrane-like substance, surprisingly thin, it soon shrivelled up, and decayed."

The reproductive power of the Barbadoes animal flower is prodigious. Many people coming to fee thefe strange creatures, and occasioning some inconve-

nience to a person through whose grounds they were obliged to pais, he resolved to destroy the objects of their curiofity; and, that he might do so effectually, caused all the holes out of which they appeared, to be carefully hored and drilled with an iron instrument, fo that we cannot suppose but their bodies must have been entirely crushed to a pulp: nevertheless, they again appeared in a few weeks from the very same places.

Plate XXX. fig. 1. represents the actinia sociata, or clustered animal flower, described by Mr Ellis, with its radical tube adhering to a rock: (a) One of the animals stretching out its claws. Fig. 2. A perpendicular diffection of one of the bodies, to show the gullet, inreftines, fromach, and fibres or tendons that move the claws: (a) A young one arising out of the adhering sube. Fig. 3. The actinia after, or animal flower of the newly coded islands. Fig. 4. the actinia anemone, or fea anemone from the fame place. Fig. 5. The under part of the same by which it adheres to the rocks. Fig. 6. The actinia helianthus, or the sea sun flower from ditto. Fig. 7. The under part of the same. Fig. 8. The actinia dianthus, or fea carnation, from the rocks at Hastings in Sussex. This animal adheres by its tail, or fucker, to the under part of the projecting rocks opposite to the town; and, when the tide is out, has the appearance of a long white fig: this is the form of it when put into a glass of sea water. It is introduced here as a new variety of this animal not yet described.

ANIMAL Food. See FOOD.

ANIMAL Occonomy. This subject is explained under

ANIMAL Magnetism. See MAGNETISM. ANIMAL Spirit. See NERVOUS Fluid.

Animal System denotes the whole class of beings endowed with animal life, otherwise called Animal KINGDOM.

Animais, the preparation of, for collections or mufeums. See QUADRUPEDS, BIRRS, REPTILES.

Pairing of Animals. See Pairing.

ANIMALCULE, in general, fignifies a little animal; and thus the term might be applied to every animal which is confiderably inferior in fize to ourfelves. It hath been customary, however, to distinguish by the name of animalcules only fuch animals as are of a fize fo diminutive, that their true figure cannot be difcerned without the affifiance of glaffes; and more especially it is applied to fuch as are altogether invitible to the naked eye, and cannot even be perceived to exist but by the affiltance of microscopes.

By the help of magnifying glasses, we are brought into a kind of new world; and numberless animals are discovered, which from their minuteness must otherwise for ever have escaped our observation: and how many kinds of these invisibles there may be, is still unknown; ii- as they are discerned of all sizes, from those which are barely invilible to the naked eye, to fuch as refilt the action of the microscope, as the fixed stars do that of the telescope, and with the best magnifiers hitherto invented appear only as fo many moving points.

The smallest living creatures our instruments can flow are those that inhabit the waters: for though posfibly animalcules equally minute, or perhaps more fo, may fly in the air, or creep upon the earth, it is scarce possible to bring such under our examination; but water being transparent, and confining the creatures in it,

we are able, by applying a drop of it to our glasses, to Animaldiscover, to a certain degree of smallness, all that it contains.—Some of the most curious of these animalcules, which have been described by microscopical obfervers, we shall here give an account of.

I. The Hair-like Infect. This is so called by Mr Baker Hair-like on account of its shape; being extremely slender, insect. and frequently an hundred and fifty times as long as The body or middle part, which is nearly ftraight, appears, in some, composed of such rings as the windpipe of land animals is made up of; but in others feems rather scaled, or made up of rings that obliquely crofs one another. Its two ends are hooked or bent, pretty nearly in the same degree, but in a direction opposite to one another; and as no eyes can be discerned, it is difficult to judge which is the head or tail. Its progreffive * motion is very fingular, being performed *PLXXXL by turning upon one end as a centre, and describing al-fig. 1. most a quarter of a circle with the other, as represented in the figure. Its motions are very flow, and require much patience and attention in the observer. These Its extreme creatures are fo small, that millions of millions of them smallness, might be contained in an inch square. When viewed &c. fingly, they are exceedingly transparent, and of a beautiful green colour; but when numbers of them are brought together, they become opaque, lofe their green colour, and grow entirely black.

Notwithstanding the extreme minuteness of these ani- Delights in malcules, they feem to be foud of fociety; for, after fociety. viewing for some time a parcel of them taken up at random, they will be feen disposing themselves in a kind of regular order +. If a multitude of them are put into + Fig. 2. a jar of water, they will form themselves into a regular body, and afcend flowly to the top, where, after they have remained for fome time exposed to the air, their green colour changes to a beautiful sky blue. When they are weary of this fituation, they form themselves into a kind of rope, which flowly descends as low as they intend; but if they happen to be close to the fide of the jar, they will descend upon it. They are so nearly of the specific gravity of water itself, that they will either remain at the bottom, float on the surface. or be suspended in the middle, according as they are originally placed, or as they themselves have a mind.

A small quantity of the matter containing these animalcules 1 having been put into a jar of water, it so hap- + Rig. 3. pened, that one part went down immediately to the bottom, whilft the other continued floating on the top. When things had remained for some time in this condition, each of these swarms of animalcules began to grow weary of its fituation, and had a mind to change its quarters. Both armies, therefore, fet out at the same time, the one proceeding upwards, and the other downwards; fo that, after some hours journey, they met in . 6. the middle. A defire of knowing how they would be- Seems pole. have on this occasion, engaged the observer to watch selfed of a them carefully; and to his surprise he saw the army considerable that was marching upwards, open to the right and left degree of that was marching upwards, open to the right and left, fagacity. to make room for those that were descending. Thus, without confusion or intermixture, each held on its way; the army that was going up, marching in two columns to the top, and the other proceeding in one column to the bottom, as if each had been under the direction of wife leaders.

The hair-like insest was first discovered in a ditch at Norwich,

Found in prodigious quantity.

Animal- Norwich, one end of which communicates with the river there, and the other end with a second ditch, into which several kennels empty themselves. The length of this ditch, when Mr Baker wrote his account of this ammalcule, was at least 100 yards, and its breadth nine. The bottom, for more than a foot thick, was covered with a blackish green substance, in appearance like mud, made up for the most part of these insects; but, supposing only an half or a quarter part of it to be composed of them, according to the dimensions we have given,

their numbers must exceed all imagination.

2. Eels in paste, &c. When paste is allowed to stand till it becomes four, it is then found to be the habitation of numberless animalcules, which may be discerned by the naked eye; and though their form cannot be perfectly distinguished, their motion is very perceptible, and the whole paste will seem to be animated. Ecls in paste Fig. 4. represents one of these anguillæ magnified. viviparous. The most remarkable property of these insects is, that they are viviparous. If one of them is cut through near the middle, several oval bodies of different sizes will be feen to iffue forth. These are young anguillæ, each of them coiled up and enclosed in its proper membrane, which is so exquisitely fine, as scarce to be discernible by the greatest magnifier, while it encloses the embryo animal. The largest and most forward immediately break through this covering, unfold themselves, and wriggle about in the water nimbly; others get out, uncoil, and move themselves about more slowly; and the least mature continue entirely without motion. uterus, or vessel that contains all these oval bodies, is composed of many ringlets, not unlike the aspera arteria of land animals, and feems to be confiderably elastic; for as foon as the animalcule is cut in two, the oval bodies are thruit out with some degree of violence, from the springing back or action of this bowel. An hundred and upwards of the young ones have been feen to iffue from the body of one fingle eel, whereby the prodigious increase of them may be accounted for; as probably feveral fuch numerous generations are produced in a short time. They seem to be all prolific; and unless trial happens to be made upon one that has brought forth all its young, or when the paste has been kept for a very long time, the experiment will always fucceed.—This property of these cels being viviparous renders it highly improbable that they ever become

Animalcules of a fimilar kind are likewise found in vinegar; and, like those already described, are found to be viviparous. But it is not only in acid matters that fuch appearances are observed. In some fields of wheat, many grains may be observed, that appear blackish outwardly, as if scorched; but when opened are found to contain a foft white substance, which, attentively confidered, appears to be nothing else than a congeries of threads or fibres lying close to each other in a parallel direction, much refembling the unripe down of fome thiftles on cutting open the flower heads before they begin to blow. This fibrous matter discovers not the least fign of life or motion, unless water is applied; but immediately on wetting, provided the grains of wheat have been newly gathered, the supposed fibres separate, and appear to be living creatures. Their motions at first are very languid; but gradually become more vigorous, twifting and wriggling themselves somewhat in

the manner of the eels in paste, but always slower than Ani they, and with a great deal less regularity.

If the grains of wheat are grown dry by keepings and in that condition are cut open, the fibrous matter is very distinguishable; and, on putting water to it, will separate with great readincis, and seem like fine tubes or threads tapering at both ends: but not the least motion will be perceived till they have been in water for feveral hours, and fometimes they will never move at all. But if the same grains are steeped in water for three or four hours, or buried for some days in the earth, till they are fully faturated with moisture, and then opened with a penknife; on taking out a small portion of the white matter carefully, and spreading it thin apon a flip of glass, the animalcules will be seen bundled together, and extended longitudinally, but without motion: and though, upon the application of water, they will not revive to foon as those taken from fresh grains, whose moisture has never been exhaled; yet, after remaining an hour or two in water, they are constantly found alive and vigorous, even though the grains have been kept in a dry condition for feveral years. It is preca necessary, however, to adapt, in some measure, the necess time of continuing the grains in water or earth to the maku age and dryness of them: for if they are not opened exper before they are too much foftened, the animalcule, will mean be dead; and unless the husks are opened to let those creatures out after they have been fleeped, they incvitably perish in them : otherwise, they will continue alive in water for many months; and, should the water dry away, may be revived again by giving them a fresh fupply.

8. The Proteus. This animalcule has been dignified Prote by Mr Baker with the name of Proteus, on account of why its assuming a great number of different shapes, so as ed. scarce to be known as the same animal in its various transformations; and indeed, unless it be carefully watched while passing from one shape to another, it will often become fuddenly invilible, as happened more than

once to Mr Baker.

When water, wherein any fort of vegetable has been whe infused, or animals preserved, has stood quietly for sount fome days, or weeks, in any glass or other vessel, a flimy fubitance will be collected about the fides : fome of which being taken up with the point of a pen-knife, placed on a flip of g'ais in a drop of water, and looked at through the microscope, will be found to harbour feveral kinds of little animals that are feldom found fwimming about at large; among which the protous is one. Its shape is better understood from the sigure, Its sh than from any description that could be given. Its colon fubstance and colour seems to referrble that of a snail; and its whole shape feems to hear a considerable refemblance to that of a swan. It swims to and fro with great vivacity: but will now and then flop for a minute or two; during which time its long neck is ufually employed as far as it can reach, forwards, and on every fide, with a fomewhat flow, but equable motion, like that of a foake, frequently extending thrice the length of its body, and feemingly in fearch of food.

There are no eyes, nor any opening in the head like a mouth, to be discerned: but its actions plainly prove it to be an animal that can fee; for though multitudes of different animalcules fwim about in the same water. and its own progressive motion is very swift, it never

Similar creatures found in blighted · wheat.

D z

16

ticella.

strikes against any of them, but directs its course between them with a dexterity wholly unaccountable, should we suppose it destitute of fight.

When the protous is alarmed, it suddenly draws in its long neck, represented in fig. 5. and 6. transforming itself into the shape represented in fig. 7. when it becomes more opaque, and moves about very flowly with the large end foremost. When it has continued fome time in this posture, it will often, instead of the head and neck it had formerly, put forth a new one, with a kind of wheel machinery, represented fig. 8. the motions of which draw a current of water to it from a confiderable distance. Having often pulled in and thrust out this short head, sometimes with and sometimes without the wheel work, the creature, as if weary, will remain motionless for a while; then its head and long neck will be very flowly protruded, as in fig. 9. and it foon refumes its former agility. Sometimes it disposes of its neck and head, as represented in fig. 10.

4. The Wheel Animal, or Vorticella. This wonderful animalcule is found in rain water that has flood fome days in leaden gutters, or in hollows of lead on the tops of houses; or in the slime or sediment left by fuch water; and perhaps may also be found in other places: but if the water standing in gutters of lead, or the fediment left behind it, has any thing of a red colour in it, one may be almost certain of finding them therein. Though it discovers no figns of life except when in the water, yet it is capable of continuing alive for many months after it is taken out of the water, and kept in a state as dry as dust. In this state it is of a globular shape, exceeds not the bigness of a grain of fand, and no figns of life appear: but being put into water, in the space of half an hour a languid motion begins, the globule turns itself about, lengthens itself by flow degrees, assumes the form of a lively maggot, and most commonly in a few minutes afterwards puts out its wheels; Iwimming vigoroully through the water, as if in fearch of food; or elfe, fixing itself by the tail, works the wheels in such a manner as to bring its food to it.

Fig. 23, and 24. show the wheel animal in its globular form; fig. 11. and 12. in its magget state; and fig. 13, 14, 15, 16, 17, 18, 19, 20, 21, and 22. show the different appearances of its wheels, and also its various intermediate changes between the globular and maggot state.

The most remarkable part of this animalcule is its wheel work. This confifts of a couple of femicircular inftruments, round the edges of which many little fibrillæ move themselves very briskly, sometimes with a kind of rotation, and fometimes in a trembling or vi-Lyating manner. When in this flate, it fometimes unfastens its tail, and swims along with a great deal of fwiftness, seemingly in pursuit of its prey. Sometimes the wheels feem to be entire circles, armed with small teeth, like those of the balance wheel of a watch, appearing projected forwards beyond the head, and extending fidewife fomewhat wider than its diameter. The teeth or cogs of these wheels seem to stand very regularly at equal diffance: but the figure of them varies according to their position, the degree of their protrusion, and perhaps the will of the animal itself. They appear fometimes like minute oblong fquares, rifing at right angles from the periphery of a circle, like

ancient battlements on a round tower; at other times Animalthey terminate in sharp points, and altogether resemble a kind of Gothic crown. They are often feen in a kind of curvular direction, all bending the same way, and feeming like fo many hooks; and now and then the ends of them will be perceived to be clubbed like mallets. This figure, however, as well as the first, they assume but rarely.

As these wheels are everywhere excessively transparent, except about their circular rim or edge, where the cogs are fet, it is very difficult to determine by what contrivance they are turned about, or what their real figure is, though they feem exactly to refemble wheels moving round upon an axis. It is also hardly Shows all possible to be certain whether those circular bodies in the marks which the teeth are fet, are of a flat form, or hollow of a real roand conical; but they feem rather to be of a conical tation. figure. The difficulty of conceiving how an articulation could be contrived fo as to cause a real rotation, hath caused many people imagine that there was a deception in this case: But Mr Baker assures us, that when the wheels are fully protruded, they never fail to show all the visible marks of a regular rotation; and, in some positions, the same cogs or teeth may be traced by the eye during a complete revolution.

All the actions of this creature feem to imply faga-Showsgreat city and quickness of sensation. At the least touch or quickness of motion in the water, they inflantly draw in their wheels; fenfationand Mr Baker conjectures, that their eyes are lodged fomewhere about the wheels; because, while in the maggot state, its motions are flow and blundering; but, after the wheels are protruded, they are performed with great regularity, swiftness, and steadiness.

Notwithstanding the minuteness of this animalcule, the microscope generally discovers others in the same drop of water, compared with which the wheel animal may be faid to be a whale. The transparency of its body, therefore, allows its internal parts to be feen, which cannot be perceived in the minutest animalcules, on account of the fmallness of their fize. a, Is the appearance of the head; and though it is everywhere transparent, Fig. 15. a ring or circle, more particularly remarkable for its 20 clearness, is commonly perceived about the middle of Description of its interthe forehead, a little above the mouth. This, Mr Ba-nal parts. ker thinks, might justly be called the feat of the brain. Many veffels which feem to take their origin from thence are discernible in the head, wherein some transparent fluid appears continually agitated by a kind of fluctuating motion.

The thorax, b, is joined to the head by a very short neck, c, and appears to be about the fixth part of the whole length of the animal. In the middle of the thorax is placed the heart, d, where its fystole and diaftole are plainly visible. It is seen through the back of the infect, shutting and opening alternately with great regularity and exactness. Its size is proportionable to the creature's bigness; and its shape, during the systole, is nearly circular, being composed seemingly of two semilunar parts, which then approach each other laterally, and form between them a roundish or horse shoelike figure, whose upper fide is flat, and the under one convex. The diaftole is performed by a feeming feparation, or opening, of these two semilunar parts, whereby the transverse diameter of the heart is very much enlarged. This separation begins exactly in the

middle

wheel k dc-

Animal- middle of the lower part next the tail; and opens to fuch a confiderable width upwards, that the two parts, when at their utmost diffention, seem only joined by an arched veffel at their anterior end. The alternate motions of contraction and dilatation are performed with great strength and vigour, in pretty; much the same time as the pullation of the arteries of a man in health. The motions of the heart are communicated to all the internal parts of the thorax; and feem to extend a great deal further; for a strict examination discovers, at the fame time, throughout the whole animal, contractions and dilatations going on, that are apparently corre-spondent thereto. These motions of the heart, however, are fometimes suspended or imperceptible for two or three minutes: after which they are renewed, and go on again with the same regularity as before. From the under part of the thorax proceeds a small transparent horn represented at a, fig. 11. and 12. It is never visible but when the animal turns on its back or fide.

> The blood or circulating fluid of the wheel animal is fo absolutely colourless, that the current of it through the veffel is indiffinguishable by glasses. A fort of irregular agitation of fome fluid is indeed perceived, which is perhaps a compound motion of currents running different ways, and forming fuch an appearance, though no fingle current is anywhere distinctly visible.

> Immediately below the thorax is another annular division, e, joining upwards to the thorax and downwards to the abdomen, the entrance whereof it serves occasionally to enlarge or diminish. The abdomen f, is by much the largest part of the animal, and contains the stomach and intestines. When the infect is full of food, these bowels appear opaque and of a blood-red colour, extending quite through the belly and great part of the tail, and exhibiting a variety of contractions and dilatations. The belly is capable of stretching out greatly in length, or being shortened very much, and widening its diameter. It assumes many shapes, and becomes occasionally a case for all the other parts of the body.

Other kinds of wheel animals.

Besides the above mentioned one, there are found in the waters feveral other species of animals furnished with wheels, some of which appear to have a rotatory, and others a vibratory, motion. Fig. 25. represents a kind found in the ditch at Norwich, where the hairlike infect is produced. They differ from the foregoing only in having very long tails. Fig. 26, 27, and 28. represent a species of wheel animals, which are also covered with shells. The body of this species consists of three parts, in like manner as the other; only the thorax and abdomen, in this, are not separated by ary gut, or intermediate veffel, but are joined immediately together. The heart is plainly perceived, having a regular systole and diastole, at a, as in the former specics. These creatures occasionally draw themselves entirely within their shells; and the shell then appears terminated by fix short spikes on one side and two on the other.

The young ones of this species are carried in oval facproducing culi, or integuments, fastened externally on the lower their young part of their shells somewhere about the tail; these sacculi are fometimes opaque only at one end, and feemingly empty at the other; sometimes they appear opaque in the middle, with a transparency all round, as

in fig. 26. When the young one is about to burst its in- Animali teguments, the parent affifts it greatly, by wagging its tail, and striking the oval bag, so that the young one's head becomes as it were forced into the water, though the tail cannot be fo foon disengaged. In this condi-Fig. 28. tion the young one fets its wheel a-going, and exerts all its endeavours to free itself from its confinement. When it has got clear, it swims away, wagging its tail as the old one does, and leaving the integument adhering to the shell of the parent. The old one then uses a number of efforts to get rid of this encumbrance, striking against it with her tail, fixing the end of her tail upon it, and then darting her body forward; with feveral very odd motions not easy to be described. This Infett kind of wheel animals are great tormentors of the wa-Pulex & ter flea, Pulen aquaticus arlierescens of Swammerdam; quaticus of which a figure is given from that author (Plate XXXII.); fig. 2. shows the natural fize of the fea: and fig. 1. shows it magnified, with some of the wheel animals adhering to it. These insects are often found in great numbers in the same vater: and when that is the case, it is not uncommon to discover five or fix of these crustaceous wheel animals sastened by their tail to the shell or horns of the flea; causing it, securingly, a vast deal of uneafiness; nor can they be driven away, or shaken off, by all the efforts the slea can use for that purpose.

5. The Bell flower Animal, or Plumed Polype. These Bell flow animalcules dwell in colonies together, from ten to fif-animal. teen (seldom falling short of the former number, or exceeding the latter), in a slimy kind of mucilaginous or gelatinous case; which, out of the water, has no determined form, appearing like a little lump of flime; but, when expanded therein, has fome refemblance to the figure of a bell with its mouth upwards; and is usually about half an inch long, and a quarter of an inch in diameter. These bells, or colonies, are to be found adhering to the large leaves of duckweed, and other aquatic plants. They may be most cafily disco-Where d vered by letting a quantity of water, with duckweed in coveredit, fland quictly for three or four hours in glass vessels in a window, or other place whence a firong light comes: for then, if any are about the duckweed, they will be found, on eareful inspection, extending themfelves out of their cases, and making an elegant appearance.

The bell, or case, which these animals inhabit, being very transparent, all the motions of its inhabitants may be discerned through it distinctly. It seems divided internally into several apartments, or rather to contain several fmaller facculi, each of which encloses one of thefe animals. The openings at the tops of these facculi, are but just sufficient to admit the creature's head and a small part of its body to be thrust out beyond them, the rest remaining always in the case. It can, however, occasionally retire into its case altogether; and never fails to do so when alarmed by any sudden motion of

the water, or of the veffel which contains it.

Beside the particular and separate motion which each Motions of these creatures is able to exert within its own case the whole and independent of the rest; the whole colony together colony. has a power of altering the polition of the bell, or even of removing it from one place to another; and hence this bell is sometimes found standing perfectly upright. as in fig. 29. and 33. and sometimes bending the upper

Pai t

part downwards, as in fig. 30. As these animalcules feem not to choose to stay together in societies whose number exceeds 15, when the colony happens to increase in number, the bell may be observed to split gradually, beginning from about the middle of the upper or anterior extremity, and proceeding downwards towards the bottom, as in fig. 32. till they at last separate entirely, and become two complete colonies independent of each other, one of which fometimes removes

to another part of the vessel. The arms of each individual of this colony are fet indi- round the head, to the number of 40, having each the figure of an Italic f, one of whose hooked ends is fastened to the head; and all together, when expanded, compose a figure shaped somewhat like a horse's shoe, convex on one fide next the body, but gradually opening and turning outwards, so as to leave a considerable area within the outer extremities of the arms. When the arms are thus extended, the creature, by giving them a vibrating motion, can produce a current in the water, which brings the animalcules, or whatever other minute bodies are within the sphere of its action, with great velocity to its mouth, fituated between the arms; where they are taken in if liked, or driven away by a contrary motion. The food is conveyed immediately from the mouth or opening between the arms, through a narrow neck, into a paffage feemingly correspondent to the cosophagus in land animals; down which it pasfes into the flomach, where it remains for some time, and then is voided upwards, in fmall round pellets, thro' a gut whose exit is near the neck. The body confilts of three divisions; in the uppermost of which are contained all the above mentioned intestines, which are only to be differred when the creature is full, at which time they become opaque. The other two divisions, which are probably fixed to the bell, feem to be of no other use than to give the creature a power of contraction and extension. The arms are not able to contract like those of the common polype; but when the animal retires into its case, they are brought together in a close and curious order, fo as to be eafily drawn in. Though their general appearance, when expanded, is that of a cup whose base and top are of an horse-shoe form, they fometimes separate into four parts, and range themselves as in fig. 36. so as to refemble four separate plumes of per feathers. Though their eyes cannot be discovered, yet of Mr Baker thinks they have fome perception of the light: for when kept in the dark, they always remain contracted; but on being exposed to the light of the sun or of a candle, they conflantly extend their arms, and show evident signs of being pleased.

Fig. 29. represents one complete colony or bell standing erect, with all the animals out of their kingdom, and their arms extended, exhibiting all together a very pretty appearance. a, represents two oval bodies, supposed by Mr Baker to be eggs.

Fig. 30. shows all the creatures withdrawn into their cells, and the end of the bell hanging downwards.

Fig. 33. shows the bell erect, with only one of the animals coming out, in order to show its connexion with the bell.

Fig. 34. shows the head and arms of a single polype closing together and disposing themselves in order to be drawn into the bell.

Fig. 35. shows one complete animal greatly magni

fied, to show it's several parts more distinctly; viz. a. Animalthe head, refembling a horse shoe; b b, the arms seen from one fide; c, the narrow neck; d, the cefophagus; e, the stomach; f, the gut or last intestine through which the food passes after being digested in the stomach; g. the anus, where the fæces are discharged in little pellets; bi, that part of the bell which furrounds the body of the animal, and closes upon it when it retires down.

Fig. 37. the head and arms feen in front.

6. The Globe animal. This animalcule, represented Globe anifig. 38. feems exactly globular, having no appearance mal. of either head, tail, or fins. It moves in all directious, forwards or backwards, up or down, either rolling over and over like a bowl, spinning horizontally like a top, or gliding along finoothly without turning itself at all. Sometimes its motions are flow, at other times very fwift; and, when it pleafes, it can turn round, as it were upon an axis, very nimbly, without removing but of its place. The whole body is transparent, except where the circular black spots are shown in the figure. Some of the animals have no spots, and others from one to feven. The furface of the whole body appears, in some, as if all over dotted with points; in others, as if granulated like shagreen: but their more general appearance is, as if befet thinly round with short moveable hairs or bristles, which probably are the instruments by which their motions are performed. These animalcules may be seen by the naked eye, but

appear only like moving points.
7. The Pipe animal. These creatures are found on Pipe ani. the coast of Norfolk, living in small tubes or cases of mal fandy matter, in fuch multitudes as to compose a mass fometimes of three feet in length. Fig. 39. shows a piece of fuch a congeries broke off, where aaaa reprefent the mouths or openings of the pipes wherein the little animals make their abode. Fig. 40. shows one fingle pipe, with its inhabitant, separated from the rest, and magnified nine or ten times in diameter. The pipe or case b is made of sand, intermixed here and there with minute shells, and all cemented together by a glutinous slime, probably issuing from the animal's own body c, which is composed of muscular ringlets like those of a worm, capable of great extension or contraction. The anterior end or head, d, is exceedingly beautiful, having round it a double row of little arms disposed in a very regular order, and probably capable of extension, in order to catch its food, and bring it to its mouth. Some of these tubes are found petrified, and Sometimes

constitute one species of syringoides.

8. An Insect with net like arms. The properties and ned shape of this little animal are very extraordinary. It is found only in cascades, where the water runs very swift. Infed with There thefe infects are found in clusters, standing erect like on their tails; and refembling, when all together, the combs of bees at the time they are filled with their aureliæ. On being taken out of the water, they fpin threads, by which they hang exactly in the same manner as the garden spider. Fig. 42. shows one of these infects magnified. Its body appears curioufly turned as on a lathe; and at the tail are three sharp spines, on which it raifes itself, and stands upright in the water; but the most curious apparatus is about its head, where it is furnished with two instruments like sans or nets, which ferve to provide its food. These it frequently spreadsout and draws in again; and when drawn up, they

found petri-

Animal- are folded together with the utmost nicety and exactness, fo as to be indifcernible when brought close to the body. At the bottom of these sans a couple of claws are fakened to the lower part of the head, which, every time the nets are drawn in, conduct to the mouth of the animal whatever is taken in them. When the creature does not employ its nets, it thrusts out a pair of sharp horns, as in fig. 41. where the infect is shown magnified about 400 times.

Some of these creatures being kept with water in a vial, most of them died in two days; and the rest, having fpun themselves transparent cases (which were fastened either to the sides of the glass, or to pieces of grass put into it), seemed to be changed into a kind of chrysalis: but, before taking this form, they appeared as in fig. 43. which shape they likewife assumed when weary with catching their food, or when lying in wait for it. None of them lived above three days; and though fresh water was given them two or three Surprising times a-day, yet, in a few hours, it would stink to a property of degree scarce conceivable, and that too at several yards ipoiling was diffance, though, in proportion to the water, all the included infects were not more than as I to 150,000. This makes it probable, that it is necessary for them to live in a rapid stream, lest they should be poisoned by the effluvia iffuing from their own bodies, as no doubt they were in the vial.

An aquatic worm.

9. A curious aquatic worm. This animalcule is shown, magnified, at fig. 31. It is found in ditch water; and is of various fizes, from 10 to 2 of an inch in length. About the head it is somewhat of a yellowish colour; but all the rest of the body is perfectly colourless and transparent, except the intestines, which are confiderably opaque, and disposed as in the figure. Along its fides are feveral papilla, with long hairs growing from them: it has two black eyes, and is very nimble. But the most remarkable thing in this creature is a long horn or proboscis; which, in the large ones, may be hts horn or feen with the naked eye, if the water is clear, and is fometimes it of an inch in length: this it waves to and fro as it moves in the water, or creeps up the fide of the glass; but it is not known whether it is hollow, or of what use it is to the creature itself.

36 Spermatic animals. when difcovered.

35

probolcis.

10. Spermatic Animals, and Animalcula Infusoria. The discovery of living animalcules in the semen of most animals is claimed by Mr Lecuwenhock and Mr Nicholas Hartfoeker, who both fay they published it about the end of the year 1677 or beginning of 1678: but Mr Lecuwenhoek having given the most particular description of, and made by far the greatest number of experiments concerning them, the discovery is commonly attributed to him.

37 General appearance every animal.

According to this naturalist, these animalcules are found in the femen masculinum of every kind of anithe same in mal: but their general appearance is very much the fame, nor doth their fize differ in proportion to the bulk of the animal to which they belong. The bodies of all of them feem to be of an oblong oval form, with long tapering flender tails iffuing from them; and as by this shape they resemble tadpoles, they have been frequently called by that name; though the tails of them, in proportion to their bodies, are much longer than the tails of tadpoles are: and it is observable, that the animalcules in the femen of fishes have tails much longer and more flender than the tails of those in other ani-

mals; infomuch, that the extremity of them is not to Animals be discerned without the best glasses, and the utmost attention. Fig. 21. N° 1, 2, 3, 4, represent the sper-matic animalcula of the rabbit; and N° 5, 6, 7, 8, those Pl. XXXIL of a dog; according to Mr Leeuwenhoek.

The numbers of these animalcula are inconceivable. Inconceiv-On viewing with a microscope the milt or semen mas-able numculinum of a living cod fish, innumerable multitudes of ber and mianimalcules were found thereinof such a diminutive size, nutencle. that he supposed at least 10,000 of them capable of being contained in the bulk of a grain of fand; whence he concludes, that the milt of this fingle fish contained more living animalcules than there are to be found people living in the whole world. To find the comparative fize of these animalcules, Mr Leeuwenhock placed an hair of his head near them; which hair, through his microscope, appeared an inch in breadth; and he was fatisfied, that at least 60 fuch animalcules could easily lie within that diameter; whence, their bodies being spherical, it follows, that 216,000 of them are but equal to a globe whose diameter is the breadth of a hair. He observed, that when the water wherewith he had diluted the femen of a cod fish was exhaled, the little bodies of the animalcules burst in pieces; which did not happen to those in the semen of a ram: and this he imputes to the greater firmness and confidency of the latter, as the flesh of a land animal is more compact than fish.

These animalcules appear to be very vigorous, and Arc contis tenacious of life; for they may be observed to move nually in long after the animal from which they are taken is dead. motion. They have this peculiarity also, that they are continually in motion, without the least rest or intermission, provided there is fluid fufficient for them to fwim about in. These animalcula are peculiar to the semen; nothing that has the least token of life being discovered, by the best glasses, either in the blood, spittle; urine, gall, or chyle. Great numbers, however, are to be found in the whitish matter that slicks between the teeth; some of which are of an oval figure, and others refemble cels.

The Animalcula Infuforia take their name from their Animalcula being found in all kinds either of vegetable or animal infuforia. infusions. Indeed, there is scarce any kind of water, unless impregnated with some mineral substance, but what will discover living creatures .- Mr Leeuwenhock Mr Leeufays, that at first he could differ n no living creatures wenhock's in rain water; but after standing some days, he disco-account of vered innumerable animalcules, many thousands of times animalcules in rain waless than a grain of fand, and in proportion to a mite as ter. a bee is to a horse.-In other rain water, which had likewise stood some time, he found the smallest fort he had ever feen; and, in a few days more, met with others eight times as big as these, and almost round. In another quantity of rain water that had been exposed like the former, he discovered a kind of animalcules with two little horns in continual motion. The fpace between the horns was flat, though the body was roundish, but tapering a little towards the end; where a tail appeared, four times as long as the body, and the thickness of a spider's web. He observed several hundreds of these within the space a grain of fand would occupy. If they happened on the least filament or string, they were entangled in it; and then would extend their bodies into an oblong round, and ftruggle hard to difengage their tails. He observed a second

mal- lort of an oval figure, and imagined the head to stand at the sharpest end. The body was flat, with several fmall feet moving exceeding quick, but not discernible without a great deal of attention. Sometimes they changed their shape into a perfect round, especially when the water began to dry away. He met also with a third fort, twice as long as broad, and eight times fmaller than the first: yet in these he discerned little feet, whereby they moved very nimbly. He perceived likewise a fourth fort, a thousand times smaller than a louse's eye, and which exceeded all the rest in brisknefs: he found these turning themselves round, as it were upon a point, with the celerity of a top. And he fays, there were feveral other forts.

Surprising production of these animalcules.

tatocs.

The production of animalcula infusoria is very furprifing. In four hours time, an infusion of cantharides has produced animalcula less than even the tails of the spermatic animals we have already described. Neither do they feem to be subject to the fate of other animals; but, several kinds of them at least, by dividing themselves in two, to enjoy a fort of immortality. Nor do the common methods by which other animals are destroyed, seem to be effectual for destroying their vital principle. Hot mutton gravy, secured in a phial with a cork, and afterwards fet among hot ashes to destroy as effectually as possible every living creature that could be supposed to exist in it, has nevertheless been found fwarming with animalcules after standing a few days. Mr Ellis's In the Philosophical Transactions, Vol. LIX. we have account of the following curious account, given us by Mr Ellis, animalcules of animalcules produced from an infusion of potatoes fion of po- and of hempfeed.

"On the 25th of May 1768, Fahrenheit's thermometer 70°, I boiled a potato in the New River water till it was reduced to a mealy confishence. I put part of it, with an equal proportion of the boiling liquor, into a cylindrical glass vessel that held something less than half a wine pint, and covered it close immediately with a glass cover. At the same time, I sliced an unboiled potato; and, as near as I could judge, put the fame quantity into a glass vessel of the same kind; with the fame proportion of New River water not boiled; and covered it with a glass cover; and placed both vef-

fels close to each other.

"On the 26th of May, 24 hours afterwards, I examined a finall drop of each, by the first magnisser of Wilson's microscope, whose focal distance is reckoned at 10 part of an inch; and, to my amazement, they were both full of animalcula of a linear shape, very diflinguishable, moving to and fro with great celerity; fo that there appeared to be more particles of animal than vegetable life in each drop.

"This experiment I have repeatedly tried, and always found it to succeed in proportion to the heat of the circumambient air; fo that even in winter, if the liquors are kept properly warm, at least in two or three

days the experiment will fucceed.

"What I have observed are infinitely smaller than fpermatic animals, and of a very different shape: the truth of which every accurate observer will soon be convinced of, whose curiofity may lead him to compare them; and I am persuaded he will find they are no way akin.

" At present I shall pass over many other curious observations, which I have made on two years experiments, in order to proceed to the explaining a hint Animalwhich I received last January from M. de Sausline of Geneva, when he was here; which is, that he found one kind of these animalcula infusoria that increase by dividing across into nearly two equal parts.

"I had often feen this appearance in various species a year or two ago, as I found upon looking over the minutes I had taken when I made any new observation; but always supposed the animal, when in this

flate, to be in coition.

" Not hearing, till after M. de Sauffure left this kingdom, from what infusion he had made his observation; his friend Dr de la Roche of Geneva informed me, the latter end of February last, that it was from

hempfeed.

"I immediately procured hempfeed from different From an a feedsmen in different parts of the town. Some of it I fusion of put into New River water, some into distilled water, hemple of and fome I put into very hard pump water. The refult was, that in proportion to the heat of the weather, or the warmth in which they were kept, there was an appearance of millions of minute animalcula in all the infusions; and, some time after, some oval ones made their appearance, as at fig. 3. b, c. Thefe were much larger than thefirst, which still continued; these weighted to and fro in an undulatory motion, turning themselves round very quick all the time that they moved forwards. I was very attentive to fee these animals divide then the felves; and at last I perceived a few of the appearance here of fig. 3. a, as it is represented by the first marmifice, in two of Wilson's microscope; but I am so well a mineced by experience that they would feparate, that I did not wait to fee the operation: however, as the following sketches, which I have drawn from five other specie, will very fully explain this extraordinary phenomenon, there will be no difficulty in conceiving the manner of the first. See fig. 4, 5, 6, 7, 8.

"The proportion of the number of the le animals which I have observed to divide in this manner, to the rest, is scarce I to 50; so that it appears rather to arise from hurts received by some sew animalcula among the many, than to be the natural manner in which these kinds of animals multiply; especially if we consider the infinite quantity of young ones which are visible to us through the transparent skins of their bodies, and even the young ones that are vilible in those young ones

while in the body of the old ones.

"But nothing more plantly shows them to be zoophytes than this circumstance, That when, by accident, the extremity of their bodic, has been shrivelled for want of a fupply of freth water, the applying more fresh water has given motion to the part of the animal that was flill alive; by which means, this shapeless figure has continued to live and fwim to and fro all the

time it was supplied with fresh water.

"I cannot finish this part of my remarks on these animals, without observing, that the excellent Linnaus has joined the beroe with the volvox, one of the animalcula infusoria. The beroe is a marine animal, found Beroe deon our goalt; of a gelatinous transparent nature, and scribed. of an oval or spherical form, from half an inch to an inch diameter; div ded like a melon into longitudinal ribs, each of which is furnished with rows of minute fins; by means of which, this animal, like the animalcula infusoria, can swim in all directions with great

fwiftness.

inimal, cule.

swiftness. In the same manner I have seen most of those minute animals move so swift that we could not account for it, without supposing such a provision in nature, which is really true, but cannot be feen till the animals grow faint for want of water; then, if we attend, we may with good glasses plainly discover them.

Withod of mual-

"I have lately found out, by mere accident, a mealcovering thod to make their fins appear very diffinctly, especially in the larger kind of animalcula, which are common to most vegetable infusions; such as the terebella. This has a longish body, with a cavity or groove at one end, like a gimlet: by applying, then, a small stalk of the horse-shoe geranium (or geranium zonale of Linnæus), fresh broken, to a drop of water in which these animalcula are swimming we shall find that they will become torpid inflantly; contracting themselves into an oblong oval shape, with their fins extended like so many briftles all round their bodies. The fins are in length about half the diameter of the middle of their bodies. Before I discovered this expedient, I tried to kill them by different kinds of falts and spirits; but though they were destroyed by this means, their fins were fo contracted, that I could not diffing with them in the leaft. After lying in this flate of torpidity for two or three minutes, if a drop of clean water is applied to them, they will recover their shape, and fwim about immediately, rendering their fine again invisible."

Fig. 3, 4, 5, 6, 7, 8, represent different species of animalcula infusoria, mentioned by Mr Ellis as belong-

ing to the genus of volvox of Linnzus.

Fig. 3. represents the volvox ovalis, or egg-shaped volvox; at (b) and (c) it is expressed in its natural shape; at (a) the manner in which it becomes two snimals, by feparating across the middle. This was found in the infusion of hempfeed; but is found in other wegetable infulions, particularly that of tea-feed.

Fig. 4. is the volvox torquilla, or wryneck. At (a) is represented its divided state; at (b) and (c) its natural state; this is common to most vegetable infusions,

as is the following.

Fig. 5. is the volvox volutans, or the roller. At (a) the animal is separated, and becomes two distinct beings, each swimming about and providing for itself: this is often the prey of another species of this genus, especially while it is weak by this separation, not being fo active for some time till it can recover itself. At [c the animal appears to be hurt on one fide; this impresfion in a little time is succeeded by another in the opposite side, as at (b), which soon occasions a division. At (d) is the fide view, and at (e) the front view, of the natural shape of the animal.

Fig. 6. is the volvox onifcus, or wood-loufe. At (2) is the natural shape of it, as it appears full of little hairs both at the head and tail; with those at the head, it whirls the water about to draw its prey to it; the feet, which are many, are very visible, but remarkably fo in a fide-view at (d). At (b) it is represented beginning to divide; and at (c) the animals are ready to part: in this state, as if in exquisite pain, they fwim round and round, and to and fro, with uncommon velocity, violently agitated till they get afunder. This was found in an infusion of different kinds of pine branches.

Vos. II. Part I.

Fig. 7. is the volvox terrebells, or the gimlet. This is Animalone of the largest of the kind, and is very visible to the naked eye. It moves along swiftly, turning itself round as it swims, just as if boring its way. (a) and (b) are two views of its natural shape, (c) shows the manner of its dividing. When they are separated, the lower animal rolls very awkwardly along, till it gets a groove in the upper part. (d) represents one of them lying torpid, by means of the juice of the horse-shoe geranium, with its fins extended. This animal is found in many infulions, particularly of grafs or corn.

Fig. 8, is the volvox vorax, or glutton. This animal was found in an infusion of the Tartarian pine; it varies its shape very much, contracting and extending its probofcis, turning it to and fro, in various directions, as at a, b, c, d, e. It opens its proboscis underneath the extremity, when it seizes its prey. The less active animals, that have lately been divided, such as those at fig. 3. (a), and at fig. 4. (a), serve it as food; when they come in its way: thefe it fwallows down instantly, as it is represented at fig. 8. h and i. At (f) it is ready to divide, and at (g) it is divided; where the hinder part of the divided animal has got a proboscis or beak, to procure nourishment for itself, and foon becomes a distinct being from the fore part.

Thus we have given as full an account as our limits would admit, of the most curious kinds of animalcules that have hitherto been observed. We cannot, however, dismiss this subject, without taking notice of some of the most remarkable hypotheses which have been formed concerning their nature and origin.

Before the invention of microscopes, the doctrine of Doctrine of equivocal generation, both with regard to animals and equivocal plants of some kinds, was univerfally received: but this generation instrument foon convinced every intelligent person, that exploded. those plants which formerly were supposed to be produced by equivocal generation arose from seeds, and the animals, in like manner, from a male and female. But as the microscope threw light upon one part of nature, it left another involved in darkness: for the origin of the animalcula infusoria, or of the spermatic animals already mentioned, remains as yet as much unknown as that of many other kinds was when the doctrine of equivocal generation reigned in full force.

The difcovery of spermatic animalcules was thought Supposed to throw some light on the mysterious affair of genera-discovery tion itself, and these minute creatures were imagined to concerning be each of them individuals of the fame species with the generation parent. Here the infinite number of these animalcules

was an objection, and the difficulty remained as great as before; for, as every one of these animalcules behoved to be produced from a male and female, to explain their origin by noimalcular generation in the fame man-

ner, was only explaining generation by itself.

Thish potheris, therefore, having proved unfatisfactory others have been invented. M. Buffon, particularly, hath invented one, by which he at once annihilates the whole animalcular world; and in this he hath been followed by feveral very ingenious philosophers. For a particular account of this, fo far as it concerns generation, we must refer to that article; but as he gives such a particular account of his having examined the human femen, that we cannot doubt of his accuracy, we shall here contrast his account with that of Mr Leeuwenhock already mentioned.

Having procured the feminal vessels of a man who died a violent death, he extracted all the liquor from them while they were still warm; and having examined a drop of it with a double microscope, it had the ap-M. Buffon's pearance, fig. 9. Large filaments appeared, which in experiments forme places ipread out into branches, and in others inman femen, termingled with one another. These filaments clearly appeared to be agitated by an internal undulatory motion, like hollow tubes, which contained fome moving fubflance. He saw distinctly this appearance changed for that fig. 10. Two of these filaments, which were joined longitudinally, gradually separated from each other in the middle, alternately approaching and reteding, like two tense cords fixed by the ends, and drawn afunder in the middle. These filaments were composed of globules that touched one another, and refembled a chaplet of beads. After this, he observed the filaments swelled in several places, and perceived fmall globular bodies iffue from the fwelled parts, which had a vibratory motion like a pendulum. These small bodies were attached to the filaments by small threads, which gradually lengthened as the bodies moved. At laft, the small bodies detached themselves entirely from the filaments, drawing after them the small thread, which looked like a tail. When a drop of the feminal liquor was diluted, these small bodies moved in all directions very briskly; and had he not seen them separate themselves from the filaments, he would, he says, have thought them to be animals. The feminal matter was at first too thick, but gradually became more fluid; and, in proportion as its fluidity increased, the filaments disappeared, but the small bodies became exceedingly numerous. Each of them had a long thread or tail attached to it, from which it evidently endeavoured to get free. Their progressive motion was extremely flow, during which they vibrated to the right and left, and at each vibration they had a rolling unfleady motion in a vertical direction.

At the end of two or three hours, the seminal matter becoming still more sluid, a greater number of these moving bodies appeared. They were then more free of encumbrances; their tails were shorter; their progressive motion was more direct, and their horizontal motion greatly diminished. In five or six hours, the liquor had acquired almost all the fluidity it could acquire, without being decomposed. Most of the small bodies were now disengaged from their threads; their sigure was oval. They moved forward with confiderable quickness, and, by their irregular motions backward and forward, they had now more than ever the appearance of animals. Those that had tails adhering to them, seemed to have less vivacity than the others: and of those that had no tails, fome altered both their figure and their fize. In twelve hours, the liquor had deposited at the bottom of the vial a kind of ash-coloured gelatinous substance, and the fluid at top was almost as transparent as water. The little bodies being now entirely freed from their threads, moved with great agility, and some of them turned round their centres. They also often changed theirfigures, from oval becoming round, and often breaking into smaller ones. Their activity always increased as their fine diminished. In 24 hours, the liquor had deposited a greater quantity of gelatinous matter, which, being with some difficulty diluted in water, exhibited an appearance fomewhat refembling lace. In the clear

femen itself only a few small bodies were now feen mov- Animaling; next day, these were still farther diminished; and after this nothing was to be feen but globules, without the least appearance of motion. Most of the above mentioned appearances are shown fig. 10, 11, 12, 13, 14, 15, 16. Fig. 17, and 18. represent an appearance of the globules in another experiment, in which they arranged themselves in troops, and passed very quickly over the field of the miscroscope. In this experiment they were found to proceed from a fmall quantity of gelatinous mucilage.

From these experiments, M. Buffon concludes, that what have been called spermatic animals, are not creatures really endowed with life, but fomething proper to compose a living creature; and he distinguishes them by the name of organic particles. The same individual kinds of animals he declares he has found in the sluids separated from the ovaria of females: and for the truth of this appeals to the testimony of Mr Needham, who was an eye witness of his experiments. He also brings an additional proof of his doctrine from Mr Needham's Needham's observation on the milt of the calmar, a species of cut-experiment the fish. Here the spermatic animals, at least what on the mile have the only appearance of life, are vastly larger than of the cal-in any other creature, so as to be plainly visible to the in any other creature, so as to be plainly visible to the naked eye. When magnified, they appear as at fig. 19, and 20. a. Their first appearance is at fig. 19. a and b, when they refemble springs enclosed in a transparent case. These springs were equally perfect at first as afterwards; only in time they contracted themselves, and became like a kind of forew. The head of the case is a species of valve which opens outward, and through which every thing within may be forced out. It contains, besides, another valve b, a little barrel c, and a fpongy substance de. Thus the whole machine confifts of an outer transparent cartilaginous case a, the fu-Fig. 20. perior extremity of which is terminated by a round head formed by the case itself, and performs the office of a valve. This external case contains a transparent tube: which includes the spring, a piston or valve, a little barrel, and a spongy substance. The screw occupies the superior part of the tube and case, the pilton and barrel are fituated in the middle, and the fpongy fubstance occupies the inferior part. These machines pump the liquor of the milt; the spongy substance is full of this liquor; and, before the animal spawns, the whole milt is only a congeries of these bodies which have sucked up all the liquor of it. Whenever these small machines are taken out of the body of the animal, and put in water, or exposed to the air, they begin to act, as represented fig. 19. and 20.; the spring mounts up, and is followed by the pitton, the barrel, and the fpongy substance which contains the liquor: and, as foon as the spring and the tube in which it is contained begin to iffue out of the case, the spring plaits, and the whole internal apparatus moves, till the spring, the piston, and the barrel, have entirely escaped from the case. When this is effected, all the rest instantly follow, and the milty liquor which had been pumped in, and confined in the spongy substance, runs

out through the barrel. According to this account, the milt of the calmar Conclusion contains no animalcules; and therefore we may from against the analogy conclude, that the small moving bodies which existence of are to be seen in the semen of other animals, are not animalcules.

really

Anings really creatures endowed with life. M. Buffon extends the analogy still further; and concludes, that all the moving bodies which are to be found in the infusions either of animal or vegetable substances are of a similar nature. "To discover (says he) whether all the parts of animals, and all the feeds of plants, contained moving organic particles. I made infusions of the figsh of different animals, and of the feeds of more than 20 different species of vegetables; and after remaining some days in close glasses, I had the pleasure of seeing organic moving particles in all of them. In some they appeared sooner, in others latter; some preserved their motions for months, and others foon lost it. Some at first produced large moving globules resembling animals, which changed their figure, split, and became gradually smaller. Others produced only small globules, whose motions were extremely rapid; and others produced filaments, which grew longer, feemed to vegetate, and then fwelled and poured forth torrents of moving globules."

53 This last observation gave rise to a new system. Ba-Baron Munchan- ron Munchansen, perceiving that the last-mentioned

resting experiments.

ten's theory moving globules, after moving for some time, began again to vegetate, concluded that they were first animals Disproved and then plants .- This strange hypothesis Mr Ellis by Mr Ellishas, overturned in the paper already quoted ; in which he afferts, that they are no other than the feeds of that genus of fungi called mucor or mouldiness, and that their motion is owing to numbers of minute animalcules attacking them for food. " Having (fays he), at the request of Dr Linnzus, made several experiments on the infusion of mushrooms in water, in order to prove the theory of Baron Munchansen, that their feeds are first animals, and then plants (which he takes notice of in his System of Nature, p. 1326, under the genus of chaos, by the name of chaos fungorum feminum), it appeared evidently, that the feeds were put into motion by very minute animalcules, which proceeded from the putrefaction of the mushroom: for by pecking at these seeds, which are reddish, light, round bodies, they moved them about with great agility in a variety of directions: while the little animals themselves were fearce visible, till the food they had eaten had discovered them. The fatisfaction I received from clearing up this point, led me into many other curious and inte-

> "The ingenious Mr Needham supposes these little transparent ramified filaments, and jointed or coralloid hodies, which the microscope discovers to us on the furface of most animal and vegetable infusions when they become putrid, to be zoophytes, or branched animals: but to me they appear, after a careful ferutiny with the best glasses, to be of that genus of fungicalled mucor, or mouldiness; many of which Michelius has figured, and Linnæus has accurately described.

"Their vegetation is fo amazingly quick, that they may be perceived in the microscope even to grow and feed under the eye of the observer.

" Mr Needham has pointed out to us a species that is very remarkable for its parts of fructification. (See Philosophical Transactions, Vol. XLV. tab. 5. fig. 3. a,A.) This, he says, proceeded from an infusion of bruised wheat.

" I have feen the fame species arise from the body of a dead fly, which was become putrid by lying floating for some time in a glass of water, where some flowers

had been in the month of August 1768. This species Animalof mucor fends forth a mais of transparent filamentous roots; from whence arise hollow stems, that support little oblong oval feed vessels, with a hole on the top of each. From these I could plainly see minute globular feeds iffue forth in great abundance with an elastic force, and turn about in the water as if they were animated.

"Continuing to view them with some attention, I could just discover, that the putrid water which furrounded them was full of the minutest animalcula; and that these little creatures began to attack the seeds of the mucor for food, as I have observed before in the experiment on the feeds of the larger kind of fungi or mushrooms. This new motion continued the appearance of their being alive for some time longer: but, foon after, many of them arose to the surface of the water, remaining there without motion; and a fucceffion of them afterwards coming up, they united together in little thin masses, and floated to the edge of the water, remaining there quite inactive during the time of observation.

44 As this discovery cleared up many doubts which I had received from reading Mr Needham's learned differtation, I put into the glass several other dead flies; by which means this species of mucor was propagated fo plentifully, as to give me an opportunity of frequently trying the same experiment to my full satis-

" Laftly, These jointed coralloid bodies, which Mr Needham calls chaplets and pearl necklices, I have feen frequently very, distinctly. These appear not only on an infusion of bruifed wheat when it becomes putrid, but on most other bodies when they throw up a viscid four and are in a state of putrefaction. These, then, are evidently no more than the most common mucor, the feeds of which are everywhere floating in the air; and bodies in this state afford them a natural proper soil to grow upon. Here they fend downwards their fine transparent ramified roots into the moillure which they float upon; and from the upper part of the foum, then jointed coralloid branches rife full of feed into little grovelike figures. When a small portion of these branches and feeds are put into a drop of the same putrid water upon which the feum floats, many of these millions of little animalcula with which it abounds, immediately feize them as food, and turn them about with a variety of motions, as in the experiments on the feeds of the common mushrooms, either fingly, or two or three feeds connected together; answering exactly to Mr Need-ham's description, but evidently without any motion of their own, and confequently not animated."

M. Buffon, however, is not content with denying life M. Buffon's only to those beings where the figns of it are the most opinion of equivocal; but includes in the same rank of organic hindrent kinds of aniparticles, almost every animal too small to be discover-malcules. ed by the naked eye, and even some of those whose motions are evidently perceptible to the eye. " Almost all microscopic animals," fays he, " are of the fame nature with the moving bodies in the feminal fluids and infusions of animal and vegetable substances. The eels in paste, in vinegar, &c. are all of the same nature, and derived from the same origin. There are, perhaps, as many beings that either live or vegetate, produced by a fortuitous affemblage of organic parti-

Animal- cles, as by a constant and successive generation. Some of them, as those of the calmar, are only a kind of machines, which, though exceedingly simple, are very active. Others, as the spermatic animalcules, scem to imitate the movements of animals. Others refemble vegetables in their manner of growth and extension. There are others, as those of blighted wheat, which at pleasure can be made alternately either to live or die, and it is difficult to know to what they should be compared. There are still others, and in great numbers, which are at first a kind of animals, then become a species of vegetables, and again return alternately to their vegetable flate. The eels in paste have no other origin than the union of the organic particles of the most effential part of the grain. The first cels that appear are certainly not produced by other cels; but though they are not propagated themselves, they fail not to engender other living eels. By cutting them with the point of a lancet, we discover smaller eels issuing in great num-The body of this animal bers out of their bodies. frems to be only a sheath or fac, containing a multitude of smaller animals, which perhaps are other sheaths of the same kind, in which the organic matter is affimilated into the form of cels."

-6 Hisrcafonclufive.

Though we can by no means pretend to account for the appearance of these animalcules, yet we cannot help observing, that our ignorance of the cause of any phenomenon is no argument against its existence. Though we are not able to account in a fatisfactory manner for the origin of the native Americans, we suppose M. Buffon himfelf would reckon it abfurd to maintain that the Spaniards on their arrival there found only organic particles moving about in diforder. The case is the very fame with the cels in paste. They are exceedingly minute in comparison with us; but, with the solar microscope, Mr Baker has made them assume a more respectable appearance, so as to have a diameter of an inch and an half, or two inches, and a length proportionable. They fwam up and down very brifkly; the motion of their intestines was plainly visible; when the water dried up, they died with apparent agonies, and their mouths gaped very wide. Were we to find a creature of the fize of this magnified eel, gasping in a place where water had lately been, we certainly would never conclude it to be an organic particle, or a fortuitous afsemblage of them; but a fish. Why then should we conclude otherwise with regard to the eel while in its natural state, than that it is a little fish? In reasoning on this fubject, we ought always to remember, that, however effential the diffinction of bodies into great and fmall may appear to us, they are not fo to the Deity; with whom, as Mr Baker well expresses himself, " an atom is as a world, and a world but as an atom."-Were the Deity to exert his power for a little, and give a natural philosopher a view of a quantity of palle filled with eels, from each of whose bodies the light was reflected as when it passes through a solar microscope; instead of imagining them organic particles, the paste would appear like a little mountain; he would probably look upon the whole as a monftrous affemblage of ferpents, and be afraid to come near them. Wherever, therefore, we discover beings to appearance endowed with the principle of felf-prefervation, or whatever else we make the characteristic of animals, neither the fm: lines of their fize, nor the impossibility

of our knowing how they come there, ought to cause Animalus doubt of their being really animated.—At the fame time, it must also be remembered, that motion is not always a characteristic of animal life, even though the moving bodies should avoid one another, or any feeming obstacle placed in their way. We know, that inanimate bodies, when electrified, will avoid others endowed with an electricity of the same kind, and adhere to those which have the opposite one. As we are by no means acquainted with the utmost powers of electricity, but on the contrary, from what we do know of it have all the reason in the world to conclude that it can produce effects utterly beyond our comprehenfion, it is impossible for us to know what share it may have in producing the motions observed in vegetable infusions, or in the semen of animals.-We may also further observe, that though in Mr Ellis's experiment of the boiled potato he took it for granted that every feed of animal life would be destroyed by the boiling water, yet even this cannot be proved; nay, on the contrary, it hath been proved by undeniable experiments, that the human body itself hath endured a heat of 240 degrees of Fahrenheit (28 degrees above that of boiling water) without injury. The eggs of these animalcula might therefore be strong enough to resist the heat hitherto used in Mr Ellis's or any other experiment.

A confiderable objection to the existence of animal-Animals cules in the semen, or any other part of animal bodies, sometimes must arise from the total exclusion of air, which is found sound living fo necessary to the life of larger animals. Some in-dies. stances, however, have been observed of large animals being found in fuch fituations as they could not possibly have enjoyed the least benefit from the air for a great number of years; and in this state they have not only lived, but lived much longer than they would otherwife have done.

In Toulon harbour and road, are found folid hard stones, and perfectly entire; containing, in different cells, feeluded from all communication with the air, feveral living shell fish, of an exquisite taste, called Dactyli, i. c. Dates: to come at these fish, the stones are broken with mauls. Also, along the coast of Ancona, in the Adriatic, are stones usually weighing about 50 pounds, and fometimes even more; the outfide rugged, and eafily broken, but the infide fo hard, as to require a strong arm and an iron maul to break them; within them, and in separate-niches, are found small shell fish, quite alive, and very palatable, called Solenes or Cappe lunghe. These facts are attested by Gassandi, Blondel, Mayol, the learned bishop of Sulturara, and more particularly by Aldrovandi a physician of Bo-The two latter speak of it as a common fact which they themselves saw.

In the volume for 1719, of the Academy of Sciences

at Paris, is the following passage:

"In the foot of an elm, of the bignels of a pretty corpulent man, three or four feet above the root, and exactly in the centre, has been found a live toad, middle fized, but lean, and filling up the whole vacant space: no sooner was a passage opened, by splitting the wood, than it fcuttled away very hastily: a more firm and found elm never grew; fo that the toad cannot be supposed to have got into it. The egg whence it was formed, must, by some very fingular accident, have

Animal- been lodged in the tree at its first growth. - There the creature had lived without air, feeding on the substance of the tree, and growing only as the tree grew. This is attested by Mr Hubert, professor of philosophy at Caen."

The volume for the year 1731 has a similar observa-

tion, expressed in these words:

" In 1719, we gave an account of a fact, which, though improbable, was well attested; that a toad had been found living and growing in the stem of a middling elm, without any way for the creature to come out or to have got in. M. Seigne, of Nantes, lays before the academy a fact just of the very same nature, except that, instead of an elm, it was an oak, and largor than the elm, which still heightens the wonder. He judges, by the time requisite for the growth of the oak, that the toad must have subsisted in it, without air, or any adventitious aliment, during 80 or 100 years. M. Seigne feems to have known nothing of the fact in 1719."

With the two foregoing may be classed a narrative of Ambrole Parce, chief furgeon to Henry III. king of France, who, being a very fenfible writer, relates the following fact, of which he was an eye witness:

" Being (says he) at my feat, near the village of Meudon, and overlooking a quarryman whom I had fet to break fome very large and hard stones; in the middle of one we found a buge toad, full of life, and without any visible aperture by which it could get there. I began to wonder how it received birth, had grown, and lived; but the labourer told me, it was not the first time he had met with a toad, and the like creatures, within huge blocks of stone, and no visible opening or fiffure."

Observations of living toads, found in very hard and entire stones, occur in several authors, particularly Baptist Fulgosa doge of Genoa, the famous physicians Agricola and Horstius, and Lord Verulam: others give very specious accounts of Inakes, frogs, crabs, and lobfters, being found alive, enclosed within blocks of mar-

ble, rocks, and large stones.

An instance similar to these, of the truth of which we have no reason to doubt, was observed in this country in the year 1773, where a large toad was found in the middle of a piece of coal having not the least visible

crack or fiffure.

The Subject

Upon the whole, therefore, though philosophers are still obscure not yet able to discover how these minute creatures are produced; yet, that there really are animals much smaller than what we can discern with our naked eye, seems to be indisputable. The subject, however, is still evidently obscure, and will no doubt require the utmest attention of philosophers, as well as further improvements in the construction of microscopes, fully to investigate it.

Animalcula are said to be the cause of various disorders. The itch, from several experiments, is affirmed to be a disorder arising from the irritations of a species of animalcula found in the pultules of that ailment; whence the communication of it by contact from one to another is easily conceived, as also the reason of the cure being effected by cutaneous applications. On this foundation some have attributed the small-pox and measles, and infectious diseases; others the epilepfy, &c. to animalcules. Langius goes farther, and

pretends to reduce all diseases in general to the same Animalprinciple. A late writer at Paris, who assumed the title of an English physician, has done more. He not Animetta. only accounts for all diseases, but for the operations of all medicines, from the hypothesis of animalcules. He has peculiar animals for every difease; scorbutic animalcules, podagrical animalcules, variolous animalcules, &c. all at his service. Journ. des Sçav. Tom. LXXXII. p. 535, &c.

But as most discoveries in natural philosophy have laid a foundation for the warm imaginations of some men to form visionary theories, to the great prejudice of real knowledge; so those relating to animalcula have been drawn in, however improperly, to support the

most whimsical and chimerical systems.

Animalcules Invisible.—Naturalists suppose another species or order of invisible animalcules, viz. such as escape the cognizance even of the best microscopes, and give many probable conjectures in relation to them. Reason and analogy give some support to the existence of infinite imperceptible animalcules. The naked eye, fay fome, takes in from the elephant to the mite; but there commences a new order referved only for the microscope, which comprehends all these from the mite to those 27 millions of times smaller; and this order cannot be yet faid to be exhausted, if the microscope be not arrived at its last perfection. See further on this subject the article Microscope.

ANIMATED, or Animate, in a general sense, denotes fomething endowed with animal life. It also imports a thing to be impregnated with vermine or ani-

malcules.

ANIMATED Horse Hairs. See HORSE Hairs.

ANIMATION fignifies the informing an animal body with a foul.—The different hypotheles of physicians and philosophers, concerning the time of animation, have had their influence on the penal laws made against artificial abortions: it having been made capital to procure miscarriage in the one state, while in the other it was only deemed a venial crime. The emperor Charles V. by a constitution published in 1532, put the matter on another footing; instead of the distinction of an animated and unanimated fœtus, he introduced that of a vital and nonvital fætus, as a thing of more obvious and easy decision, and not depending on any fystem either of creation, traduction, or infusion. Accordingly a foctus is faid, in a legal fense, to be animated, when it is perceived to flir in the womb; which usually happens about the middle of the term of gestation.

ANIME, in heraldry, a term used when the eyes of a rapacious creature are borne of a different tincture

from the creature itself.

Anime, a refin excluding from the trunk of a large American tree, called by Piso jetaila, by the Indians courbaril, (a species of HYMENEA). This refin is of a transparent amber colour, a light agreeable finell, and little or no tafte. It diffolves entirely, but not very readily, in rectified spirit of wine; the impurities, which are often in large quantity, remaining behind. The Brazilians are faid to employ anime in fumigations for pains and aches proceeding from a cold cause: with us, it is rarely, if ever, made use of for any medicinal purpofes.

ANIMETTA, among ecclefiaftical writers, de-

Anna.

notes the cloth wherewith the cup of the eucharift is

ANINGA, in commerce, a root which grows in the Antilles islands, and is pretty much like the China plant. It is used by sugar-bakers for resining the

ANJOU, a province and duchy of France, bounded on the cast by Touraine, on the south by Poictou, on the west by Bretagne, and on the north by Maine. It is 70 miles in length, and in breadth 60. Through this province run five navigable rivers: the Loire, which divides it into two parts; the Vienne, the Toue, the Maienne, and the Sarte.

The air is temperate, and the country agreeably diverfified with hills and meadows. There are 33 forests of oak trees mixed with beech. The country produces white wine, wheat, barley, rye, oats, peale, beans, flax, hemp, walnuts, and some chesnuts. In Lower Anjou they make cyder. There are fruit trees of all kinds, and pulture proper for horses. The greatest riches of the province confifts in cows, oxen, and sheep. There are several coal and iron mines; and yet there are but two forges in the whole province. There are quarries of marble and of flate; as well as quarries of white ftone, proper for building, on the fide of the river Loire. Here are also several saltpetre works and some glasshouses. The remarkable towns, besides Angers the capital, are Saumur, Brifac, Pons de Cea, La Fleche, and Beaufort.

ANIO, (Cicero, Horace, Prifcian); ANIEN, (Statius); now il Teverone: a river of Italy, which falls into the Tiber, three miles to the north of Rome, not far from Antemnæ. It rifes in a mountain near Treba, (Pliny); and running through the country of the Æquicult, or Æqui, it afterwards separated the Latins from the Sabines; but nearer its mouth, or confluence, it had the Sabines on each side. It forms three beautiful lakes in its course, (Pliny). In the territories of Tibur it falls from a great height, and there forms a very rapid cataract; hence the epithet praceps, and hence the steam caused by its fall, Horace). Anienus is the epithet formed from it, (Virgil, Propertius). Anienus is also the god of the river, (Propertius, Status).

ANISUM or Anise. See Pimpinflla.

ANKIIR, a liquid measure at Amsterdam. It contains about 32 gallons English measure.

ANKILE, in anatomy, the joint which connects the foot to the leg.—We have an account of the menses being regularly evacuated at an ulcer of the ankle, Edin. Med. Obs. Vol. 11I. art. 29.

ANN, or Annat, in Scots law, is half a year's stipend, which the law gives to the executors of ministers of the church of Scotland, over and above what was due to the minister himself for his incumbency.

ANNA, one of the three principalities into which Arabia Deferta is divided.

Anna, one of the chief cities of the above principality, and formerly a famed mart-town, is fituated in Lat. 33. 57. and E. Long. 42. 10. on the river Euphrates, in a fruitful and pleafant foil. It has two firects, which are divided by the river. That on the Mesopotamia side is about two miles long, but thinly peopled, and by none but tradesmen; that on the opposite side is about ax miles in length, and it is there

that the principal inhabitants of the city dwell. Every house has some ground belonging to it; and these grounds are loaded with noble fruit trees, as lemons, oranges, citrons, quinces, figs, dates, pomegranates, olives, all very large and in great plenty. Some of the flat grounds are fown with corn and other grain, which yield likewife a confiderable crop. This city is the common rendezvous of all the robbers that infest the country, and from which they disperse themselves into all parts of the Defert. Here they meet to confult; here they hold their grand council, and deliberate where to rob next with success. It is with great difficulty that the Turkish aga, and the janizaries, who are kept here, can levy the tribute imposed by the Turks on all the commodities carried through this city, which is one of the great thoroughfares for the passing of the caravans that go to and from Aleppo, Tripoli, Damascus, Bagdad, and some other parts of the Turkist empire.

Anna

Annan

ANNA Comnena. See Comnena. ANNABON. See Annobon.

ANNALE, in the church of Rome, a term applied to the masses celebrated for the dead during a whole year.

ANNALIS CLAVUS, the nail which the Prætor. Conful, or Dictator, drove into the wall of Jupiter's temple annually upon the ides of September, to show the number of years. But this custom was superfeded by reekoning years by consulships. The ceremony was sometimes performed to avert the plague, &c.

ANNALS, in matters of literature, a species of history, which relates events in the chronological order wherein they happened. They differ from perfect history in this, that annals are but a bare relation of what passes every year, as a journal is of what passes every day; whereas history relates not only the transactions themselves, but also the causes, motives, and springs of actions. Annals require nothing but brevity; history demands ornament.—Cicero informs us of the origin of annals. To preserve the memory of events, the Pontifex Maximus, says he, wrote what passed each year, and exposed it on tables in his own house, where every one was at liberty to read: this they called annals maximi; and hence the writers who imitated this simple method of narrating facts were called annalyses.

ANNAN, the capital of Annandale, a divition of Dumfriesshire in Scotland; a small town, containing 500 or 600 inhabitants, and fituated on a river of the same name, in W. Long. 3º. N. Lat. 54. 40. This place, which is a royal borough, has some trade in wine, and exports annually between 20 and 30,000 Winchefter bushels (10 and 15,000 bolls) of corn. Vessels of about 250 tons can come within half a mile of the town; and of 60, as high as the bridge; which confifts of five arches, defended by a gateway. A fabric for carding and spinning of cotton has lately been erected, and the town begins to increase. Here was formerly a castle; which was built by the Bruces after they became lords of Annandale. Upon the death of David II. the fon of King Robert, in 1371, this castle (Lochmaben), and the lordship of Annandale, came to Thomas Randolph earl of Murray, and went with his fifter Agnes to the Dunbars, earls of March: after their forfeiture it went to the Douglasses, who also lost it by the same fate; and then having come to

Alexander

Anoth, Alexander duke of Albany, he, for rebelling against Annand. his brother King James III. and plundering the fair of Lochmaben in 1484, was also forfeit. Since which time it continued in the hands of the king, and be-

came the great key of the west border.

The stewartry or district of Annandale, of which Lochmaben castle was the chief fortalice, is a fertile vale, 24 miles long, and about 14 miles broad. From its vicinity to England, and the continual incursions and predatory wars of the borderers, the greatest part of it was uncultivated and common: but fince the beginning of the present century, or rather within the full thirty years, all these wastes and commons have been divided and brought into culture, and the country has assumed a new appearance; which may be ascribed not only to the division of the commons, but likewise to the improvement made in the roads, and particularly in the great western road from Edinburgh to London by Moffat, Gratney, and Carlifle, running through this vale, and carried on by some gentlemen of the country, after they had obtained an act of parliament for levying a toll to defray the expence of making and keeping it in repair.

Annandale formed a part of the Roman province of Valentia; and Severus's wall ending here, it abounds with Roman stations and antiquities. The camps at Birrens in Middlebie, and on the hill of Burnfwork, are still entire, and their form is preserved; and the traces and remains of a military road are now visible in different parts of the country. The ruins of the house or castle of Auchineass, in the neighbourhood of Mosfat, once the feat of that potent baron, Thomas Randolph, earl of Murray, lord of Annandale, and regent of Scotland in the minority of David II. covers above an acre of ground, and even now conveys an idea of the plan and strength of the building. The ancient castle of Comlongan, formerly belonging to the Murrays, earls of Annandale, and now to Lord Stormont, is still in a tolerable state of preservation; but except this castle and that of Hoddom, most of the other old fortalices and towers are now taken down, or in ruins.

Annandale is a marquifate belonging to the John-

stones, and the chief of the name.

ANNAND (William), dean of Edinburgh in Scotland, the fon of William Annual minister of Air, was born at Air in 1633. Five years after, his father was obliged to quit Scotland with his family, on account of their loyalty to the king, and adherence to the episcopal government established by law in that sountry. In 1651, young Annand was admitted a fcholar in University college in Oxford; and though he was put under the care of a presbyterian tutor, yet he took all occasions to be present at the sermons preached by the loyal divines in and near Oxford. In 1656, being then bachelor of arts, he received holy orders from the hands of Dr Thomas Fulwar, bishop of Ardfert or Kerry in Ireland, and was appointed preacher at Weston on the Green near Bieester in Oxfordshire, where he met with great encouragement from Sir Francis Norris, lord of that manor. After he had taken his degree of master of arts, he was presented to the vicarage of Leighton-Buzzard in Bedfordshire; where he cislinguished himfelf by his edifying manner of preaching, till 1662, when he went into Scotland, in quality of chaplain to

John earl of Middleton, the king's high commissioner Annand to the church of that kingdom. In the latter end of the year 1663, he was instituted to the Tolbooth church Amapolis at Edinburgh, and from thence was removed some years after to the Trone church of that city, which is likewise a prebend. In April 1676, he was nominated by the king to the deanery of Edinburgh; and in 1685, he commenced Doctor of Divinity in the university of St Andrew's. He wrote, I. Fides Catholica; or, The Doctrine of the Catholic Church in eighteen grand Ordinances, referring to the word, facraments, and prayer, in purity, number, and nature, catholically maintained, and publicly taught, against heretics of all forts. Lond. 1661-2, 4to. 2. Solutions of many proper and profitable questions, suitable to the nature of each Ordinance, &c. printed with the Fides Catholica. 3. Panem Quetidianem; or, A short Discourse, tending to prove the legality, decency, and expediency, of set forms of prayers in the Churches of Christ, with a particular Defence of the Book of Common Prayer of the Church of England. Lond. 1661, 4to. 4. Pater Nofter, Our Father; or, The Lord's Prayer explained, the fense thereof, and duties therein, from Scripture, History, and the Fathers, methodically cleared, and fuccincally opened. Lond. 1670, 8vo. 5. Mysterium Pietatis; or, The Mystery of Godlinefs, &c. Lond. 1672, 8vo. 6. Doxologia; or, Glory to the Father, the Church's Hymn, reduced to glorifying the Trinity. Lond. 1672, 8vo. 7. Dualitas; or, A twofold subject displayed and opened, conducible to godliness and peace in order : First, Lex loquens, the honour and dignity of magistracy, with the duties thereupon, &c.; Secondly, Duorum Unitas; or, The agreement of magistracy and ministry at the election of the honourable magistrates at Edinburgh, and opening of the Diocesan Synod of the Reverend Clergy there. Edin. 1674, 4to. Dr Annand died the 13th of June 1689, and was honourably interred in the Grey Friars church in Edinburgh.

ANNANO, a strong fort of Italy, in the duchy of Milan. It has been twice taken by the French; but was restored to the duke of Savoy in 1706. It is seated on the river Tanaro, in E. Long. 8. 30. N. Lat.

ANNAPOLIS, the chief town in Maryland, in North America; which as yet is but mean, because the people in this province choose to live on their plantations, as in Virginia. St Mary's was once the capital of the province of Maryland, and the town of Annapolis was known by the name of Severn. It received its present name in 1694, when it was made a port town, and the residence of a collector and naval officer. W. Long. 78. 10. N. Lat. 39. 25.

Annapolis Royal, a town of Nova Scotia, is feated in the bay of Fundy; and, though a mean place, was formerly the capital of the province. It has one of the finest harbours in America, capable of containing 1000 vessels at anchor in the utmost security. The place is also protected by a fort and garrison. At the bottom of the harbour is a point of land, which divides two rivers; and on each fide there are pleafant meadows, which in fpring and autumn are covered with all forts of fresh water fowl. There is a trade carried on by the Indians with furs, which they exchange for European goods. W. Long. 64. 5. N. Lat. 45. 10.

ANNATES,

ANNATES, among ecclefiastical writers, a year's income of a spiritual living.

These were, in ancient times, given to the pope through all Christendom, upon the decease of any bishop, abbot, or parish clerk, and were paid by his successor. At the Reformation they were taken from the pope, and vested in the king; and, finally, Queen Anne restored them to the church, by appropriating them to the augmentation of poor livings.

ANNEALING, by the workmen called nealing, is particularly used in making glass: it confifts in placing the bottles, &c. whilst hot, in a kind of oven or furnace, where they are suffered to cool gradually: they would otherwise be too brittle for use.—Metals are rendered hard and brittle by hammering: they are therefore made red hot, in order to recover their malleabili-

ty; and this is called nealing.

The difference between unannealed and annealed glass, with respect to brittleness, is very remarkable. When an unannealed glass vessel is broken, it often flies into a small powder, with a violence seemingly very unproportioned to the stroke it has received. neral, it is in greater danger of breaking from a very flight stroke than from one of some considerable force. One of those vessels will often resist the effects of a pistel bullet dropt into it from the height of two or three feet; yet a grain of fand falling into it will make it burft into small fragments. This takes place sometimes immediately on dropping the fand into it: but often the vessel will stand for several minutes after, seemingly fecure; and then, without any new injury, it will fly to pieces. If the vessel be very thin, it does not break in this manner, but feems to possess all the properties of annealed glafs.

The same phenomena are still more strikingly seen in glass drops or tears. They are globular at one end, and taper to a small tail at the other. They are the drops which fall from the melted mass of glass on the rods on which the bottles are made. They drop into the tubs of water which are used in the work; the greater part of them burst immediately in the water. When those that remain entire are examined, they discover all the properties of unannealed glass in the high-They will bear a fmart stroke on the oft degree. thick end without breaking; but if the small tail be broken, they burst into small powder with a loud explofion. They appear to burst with more violence, and the powder is smaller in an exhausted receiver than in the open air. When they are annealed, they lose

those properties.

Glass is one of those bodies which increase in bulk when paffing from a fluid to a folid state. When it is allowed to crystallize regularly, the particles are so arranged, that it has a fibrous texture: it is elastic, and fusceptible of long-continued vibrations; but when a mass of melted glass is suddenly exposed to the cold, the furface crystallizes, and forms a folid shell round the interior fluid parts: this prevents them from expanding when they become folid. They, therefore, have not the opportunity of a regular crystallization; but are compressed together with little mutual cohesion: On the contrary, they press outward to occupy more space, but are prevented by the external crust. In confequence of the effort of expansion in the internal parts, the greater number of glass drops burst in cool-

ing; and those which remain entire are not regularly crystallized. A smart stroke upon them communicates a vibration to the whole mass, which is nearly synchronous in every part: and therefore the effort of expansion has little more effect than if the body were at rest; but the small tail and the surface only are regularly crystallized. If the tail be broken, this communicates a vibration along the crystallized surface, without reaching the internal parts. By this they are allowed some expansion; and overcoming the cohesion of the thin outer shell, they burst it, and are dispersed in powders.

In an unannealed glass vessel, the same thing takes place. Sometimes the vibration may continue for a considerable time before the internal parts overcome the resistance. If the vessel be very thin, the regular crystallization extends through the whole thickness; or at least the quantity of compressed matter in the middle is so inconsiderable as to be incapable of bursting the

external plate.

By the process of annealing, the glass is kept for fome time in a state approaching to studity; the heat increases the bulk of the crystallized part, and renders it so soft, that the internal parts have the opportunity of expanding and forming a regular crystallization.

A fimilar process is now used for rendering kettles and other vessels of cast iron less brittle: of it the same explanation may be given. The greater number of metals diminish in bulk when they pass from a suid to a

folid state; iron, on the contrary, expands.

When cast iron is broken, it has the appearance of being composed of grain: forged or bar iron appears to consist of plates. Forged iron has long been procured, by placing a mass of cast iron under large hammers, and making it undergo violent and repeated compression. A process is now used for converting cast iron into forged, by heat alone. The cast iron is placed in an air furnace, and kept for several hours in a degree of heat, by which it is brought near to a sluid state. It is then allowed to cool gradually, and is found to be converted into forged iron. This process is conducted under a patent; although, if Reaumur's experiments upon cast iron be consulted, it will appear not to be a new discovery.

By these experiments it is ascertained, that if cast iron be exposed for any length of time to a heat considerably below its melting point, the texture and properties are not changed: but if it be kept in a heat near the melting point, the surface soon becomes lamellated like forged iron; and the lamellated structure extends farther into the mass in proportion to the length of time in which it is exposed to that degree of heat. When it is continued for a sufficient time, and then allowed to cool gradually, it is found to posses the la-

mellated structure throughout.

Cast iron, then, is brittle, because it has not had the opportunity of crystallizing regularly. When it is exposed to cold while study, the surface becoming solid, prevents the inner parts from expanding and arranging themselves into regular crystals. When cast iron is brought near to the melting point, and continued for a sufficient length of time in that degree of heat, the particles have the opportunity of arranging themselves into that form of crystals by which forged iron is distinguished, and by which it possesses cohesion and all its properties.

There appears, therefore, to be no other effential difference between forged and cast iron, except what arises from the crystallization. Cast iron is indeed often not fussiciently purished from other substances which are mixed with the calx. It appears also to contain a considerable quantity of calx unreduced; for during the process for converting it into forged iron, by heat alone, a pale stame arises from the metal till near the end of the process. This is owing to fixed air which the heat forces off from the calx. The expulsion of this air reduces the calx, and thereby frees the metal from that injurious mixture.

That this explanation of the annealing of iron is probable, appears also from the well-known fact of forged iron being incomparably more difficult of fusion than cast iron. A piece of forged iron requires a very violent heat to melt it; but when it is reduced to a small powder, it melts in a much lower degree of heat. Iron diminishes in bulk when it passes into a sluid state, while most other metals increase in volume. The expansion which heat occasions in bringing them to their melting point, will be favourable to their fluidity by gradually bringing the particles to the same state of separation in which they are when the mass is fluid; but the expansion of iron by heat removes it farther from that state, and keeps it in the state which is favourable to the continuance of it in a crystallized form. It will not melt till the heat expand it fo much that the cohesion of crystallization be overcome. When it is reduced to a minute powder before it be exposed to the heat, it melts fooner. The crystals having been deflroyed, that cohesion has no effect in preventing it from passing into a state of sluidity.

Upon the same principles may be explained the almost peculiar property of welding possessed by iron, and

the conversion of forged iron into steel.

But perhaps they may also be applied to platina, a metal which has lately gained much attention. It possesses some of the properties of iron. It is still more difficult of suspense that that metal. It is susceptible of being welded. The natural grains of it can scarcely be melted in the focus of the most powerful burning glass; but when it is dissolved in aqua-regia, and precipitated by the vegetable alkali, it has been melted in small globules by the blowpipe. When precipitated by sal ammoniae, it has been melted in a considerable mass in the heat of a furnace; but it is said to be hard and brittle.

Many attempts have been made to procure a mass of it in a malleable state, but without success. It is said that the process is now discovered by a chemist in Spain. The treatment of the metal is probably very simple. Perhaps it only consists in precipitating it in a minute powder from aqua-regia, exposing it to a strong heat which melts it, and keeping it for some time in a state mearly sluid, that it may, like iron, crystallize regularly: by this it will possess all its metallic properties.

ANNE, queen of Great Britain, daughter of James II. when duke of York, was born in 1664, and married to Prince George of Denmark in 1683, by whom the had feveral children, but furvived them all. Upon the death of William III. March 8. 1702, the fucceeded to the throne, and to a war with France, which was profecuted under her reign by the great duke of Vol. II. Part I.

Marlborough, with more glory than profit to this nation. She effected the long wished-for union between England and Scotland, which took place May 1st, 1707: and dying August 1st, 1714, was succeeded by George Lewis Augustus elector of Hanover, as the direct descendent from James I. by his daughter Elizabeth queen of Bohemia.

St ANNE's Day, a festival of the Christian church, celebrated by the Latins on the 26th of July, but by the Greeks on the 9th of December. It is kept in honour of Anne, or Anna, mother of the Virgin Mary.

ANNECY, a city of Savoy, feated between Chamberry and Geneva, on the banks of a lake of the fame name, from whence run feveral brooks, which flow through the town, and uniting at length form a river. There are piazzas in most of the streets of the town, which serve to shelter the inhabitants from rain. It has feveral collegiate and parish churches, as well as convents for men and women. The lake is about nine miles long and four broad. E. Long. 6. 12. N. Lat. 45. 53.

ANNESLEY (Arthur), earl of Anglesey, and lord privy feal in the reign of King Charles II. was the fon of Sir Francis Annelley, Bart. Lord Mount Norris, and Viscount Valentia, in Ireland; and was born at Dublin on the 10th of July 1614. He was for some time at the university of Oxford, and afterwards studied the law at Lincoln's Inn. He had a confiderable share in the public transactions of the last century; for in the beginning of the civil war he fat in the parliament held at Oxford; but afterwards became reconciled to the opposite party, and was fent commissioner to Ulster, to oppose the designs of the rebel Owen Roe Oneal. He engaged in feveral other affairs with great fuccefs. He was prefident of the council of flate after the death of Oliver, and was principally concerned in bringing about the Refloration; foon after which, King Charles II. raifed him to the dignity of a baron, by the title of Lord Annelley, of Newport Pagnel, Bucks; and a short time after he was made earl of Anglesey. During that reign he was employed in fome very important affairs, was made treasurer of the navy, and afterwards lord privy feal. In October 1680, his lordship was charged by one Dangerfield, in an information delivered upon oath, at the bar of the house of commons, with endeavouring to stifle evidence in relation to the Popish plot, and to promote the belief of a Presbyterian one. The uneafiness he received from this attack did not prevent his speaking his opinion freely of those matters in the house of lords, particularly in regard to the Popith plot. About the same time he anfwered the Lord Castlehaven's Memoirs, in which that nobleman endeavoured to paint the Irish rebellion in the lightest colours; and a sharp dispute was raised, which ended in the feal's being taken from him. He was a person of great abilities, had uncommon learning, and was well acquainted with the constitution and laws of England. He wrote, befides his Animadversions on Castlehaven's Memoirs, 1. The Privileges of the House of Lords and Commons stated. 2. A Discourse on the House of Lords. 3. Memoirs. 4. The History of the Troubles in Ireland, from the rebellion in 1641 till the Restoration. 5. Truth unveiled, in behalf of the Church of England; -and some other works. He died in April 1686, in the 73d year of his age; and was fucceeded by his fon James.

Annexation. ANNEXATION, in law, a term used to imply the uniting of lands or rents to the crown.

ANNIHILATION, the act of reducing any creat-

ed being into nothing.

Christians, Heathens, Jews, Siamese, Persians, divines, philosophers, &c. have their peculiar systems, sentiments, conjectures; not to say dreams, concerning annihilation; and we find great disputes among them about the reality, the possibility, the means, measures, prevention, ends, &c. of annihilation.

The first notions of the production of a thing from, or seduction of it to, nothing, Dr Burnet shows, arose from the Christian theology; the words creation and arramation, in the scale now given to them, having been equally unknown to the Hebrews, the Greeks,

and the Latina.

The me, at philosophers in effect denied all annihilation as well as creation, refolving all the changes in the world into new modifications, without supposing the production of any thing new, or destruction of the old. By daily experience, they taw compounds dissolved; a d that in their dissolution nothing perished but their union or connexion of parts; when in death the body and foul were separated, the man they held to the point of the world, and the body in its earth from whence it came; these were again wrought by nature into me a compositions, and entered new states of being which had no reletion to the former.

The Persian branes hold, that after a certain period of time, containing of 71 joogs, God not only annihilates the whole torrecte, but every thing else, angels, sools, spirits, and all, by which he returns to the same starch was in before the creation; but that, having breathed a while, he goes to work again, and a new creation arises, to subsist 71 joogs more, and then to be annihilated in its turn. Thus they hold there have been almost an infante number of worlds; but how many joog, are clapted fince the left creation, they cannot certainly tell; only 10 an almanack written in the Shanforit language in 1675, the world is faid to be then

3,892,771 years old from the last creation.

The Stamele heaven is exactly the hell of fome Socimians and other Christian writers; who, shocked with the horrible prospect of eternal torments, have taken refuge in the lystem of annihilation. This system feems countenanced by Scripture; for that the words death, deliruction, and perifling, whereby the punishment of the worked is most frequently expressed in Scripture, do most properly import annihilation and an utter end of being. To this Tillotfon answers, that these words, as well as those corresponding to them in other languages, are oft a used, both in Scripture and other writings, to figure a flate of great milery and fuffering, without the utter extinction of the miserable. Thus God is often laid in Scripture to bring destruction on a nation, when he fends judgments upon them, but without exterminating or making an end of them. So, in other languages, it is frequent, by periformy, to exprcis a person's being made miterable; as in that known passage in Tiberius's letter to the Roman senate: Ita me dii, deaque omnes, pejus perdant, quam bodie perme me sentio. As to the word death, a state of misery which is as bad or worse than death may properly enough be called by that name; and thus the punishment of wicked men

after the day of judgment is in the book of Revelation Afaililafrequently called the fecond death.

Some Christian writers allow a long time of the most terrible torments of sinners; and after that suppose that there shall be an utter end of their being. Of this opinion Irenæus appears to have been; who, according to M. du Pin, taught that the souls, at least of the wicked, would not subsist eternally; but that, after having undergone their torments for a certain period, they would at last cease to be at all. But Tillemont, Pctit, Didier, and others, endeavour to desend Irenæus from this imputation, as being too favourable to the wicked.

It has been much disputed among divines, whether, at the consummation of all things, this sarth is to be annihilated, or only purified, and litted for the habitation of some new order of beings. Gerard in his Common Places, and Ilakewil in his Apology, contend cannelly for a total abolition or annihilation. Ray, Calmet, and others, think the system of renovation or restitution more probable, and more consonant to Scripture, reason, and antiquity. The fathers who have treated on the question are divided; some holding that the universe shall not be annihilated, but only its external face changed; others afterting, that the substance of it shall be destroyed.

How widely have the fentiments of mankind differed as to the possibility and impossibility of annihilation! According to iome, nothing so difficult; it requires the infinite power of the Creator to effect it: some go further, and feem to put it out of the power of God himself. According to others, nothing so easy: Existence is a state of violence; all things are continually endeavouring to return to their primitive nothing; it requires no power at all; it will do itself; nay, what is more, it requires an infinite power to prevent it.

Many authors confider prefervation as a continual reproduction of a thing, which, substitling no longer of itself, would every moment return into nothing. Gassendi on the contrary afferts, that the would may indeed be annihilated by the same power which such created it, but that to continue it there is no occasion

for any power of prefervation.

Some divines, of which number the learned Bishop King seems to be, hold annihilation for the greatest of all evils, worse than even the utmost torments of hell stames; while others, with some of the eastern philosophers, acknowledge annihilation for the ultimate pitch of happiness human nature is capable of; that sovereign good, that absolute beatitude, so long vainly sought for by the philosophers, is sound here. No wonder it had been so long concealed; for who would have thought of looking for the summum bonum, where others have placed the sum of misery?

The faid prelate proposes it as a question, Whether suffering eternal torments be a greater evil than not existing? He thinks it highly probable, that the damned will be such fools, that feeling their own misery in the most exquisite degree, they will rather applaud their own conduct, and choose to be, and to be what they are, rather than not to be at all; fond of their condition, however wretched, like people enraged, they will persist in their former sentiments without opening their cyes to their folly, and persevere by way of indignation and revenge. Mr Bayle resutes him on this head; but might, one would think, have saved himself the trouble.

Annobon.

The Talapoins hold it the supreme degree of happiness to have the foul totally annihilated, and freed from the burden and flavery of transmigrations. They speak of three Talapoins, who, after a great number of transmigrations, became gods; and when arrived at this flate, procured this further reward of their merit to be annihilated. The ultimate reward of the highest perfection man can arrive at is neivrepon, or annihilation; which at length is granted to those who are perfectly pure and good, after their fouls have wandered many thoufand years through various bodies.

ANNI NUBILES, in law, denotes the marriageable age of a woman, viz. after she has arrived at twelve.

ANNIVERSARY, the annual return of any remarkable day. Anniversary days, in old times, more particularly denoted those days in which an office was yearly performed for the fouls of the deceased, or the martyrdom of the faints was yearly celebrated in the

ANNOBON, a small island of Africa, on the coast of Loango, belonging to the Portuguele. It lies in E. Long. 5. 10. S. Lat. 1. 50. and receives its name from being difcovered on New year's day. According to Pyrard, it is about five or fix French leagues in compass; but Baudrand says, it is ten leagues round. Here are two high mountains, the tops of which being continually covered with clouds, occasion frequent rains. On the fouth-east of the illand are two rocks; one of which is low, and upon a level with the furface of the fea; the other higher and larger, but both dangerous in the night to shipping; but between them the channel is deep and clear. These rocks are inhabited by vast numbers of birds, so tame, that the sailors frequently catch them with their hands. On the same fide of the island is a convenient watering place at the foot of a rivulet, which tumbles from the mountains down to a valley covered with orange and citron trees, &c. and affording a pleasant and refreshing shade; but the road on the north-west side is difficult and dangerous, though most frequented by ships who have no intention of touching upon the continent. In either place it is difficult to take in a sufficient quantity of water, on account of the violent breakings of the sea, and a stone intrenchment erected by the negroes, from which they annoy all strangers that attempt to land. The true road for shipping lies on the north-east fide, where they may anchor in seven, ten, thirteen, or sixteen fathoms, on a fine fand close to the land, opposite to the village where the negroes have thrown up their intrenchments.

The climate is wholefome, and the air clear and ferene for the greatest part of the year. Every part of the island is watered by pleasant brooks, and fresh water fprings, which, however, at the new and full moons, or in all high tides, acquire a brackishness. The banks of every rivulet are covered with palms, whence the inhabitants extract their wine by incision. Here are a number of fertile valleys, which produce Turkey corn, rice, millet, yams, potatoes, &c. and afford pasture for abundance of oxen, theep, goats, &c. and fish also abound here; but the only mercantile production is cotton, which is effected equal in quality to any produced in India, though the quantity is fmall.

In the year 1605, the Dutch admiral Matelief

found 200 negroes, and two Portuguele, on Annobon, them, and trained up in military discipline. Las Croix Admenses fays, it has a town opposite to the road that contains above 100 houses, the whole furrounded by a parapet. Most of their dwellings are cane huts. In the whole illand there is not a lingle house built of stone, and only two of wood, which belong to the Portuguefe. All the inhabitants are meanly clothed; the women go bare-headed, and have also the upper part of the body naked, modefly being defended by a piece of linen wrapt under their stomach, and falling down in the form of a petticoat, or wide apron, to the knees. As to the men, they wear only a linen girdle round the loins, with a small slap before. The women carry their children on their backs, and fuckle them over the shoulder. All the inhabitants are subject to the Portuguese governor, who is the chief person in the island; at the same time that the negroes have their own chief subordinate to him. They are all rigid Catholics, having either been compelled or perfuaded by the arguments of the Portuguele toen brace, and. like all other converts, they are bigotted in proportion to the novelty of the behef, and their ignorance of the truc tenets.

ANNO Domini, i. e. the year of our Lord; the computation of time from our Saviour's incarnation.

ANNOMINATION, in rhetoric, the same with what is otherwise called paronomasia. See PARONO-

ANNONA, in Roman antiquity, denotes provision for a year of all forts, as of flesh, wine, &c. but especially of corn. Annona is likewife the allowance of oil, falt, bread, flesh, corn, wine, hav, and thraw, which was annually provided by the contractors for the maintenance of an army.

Annona, the Cuffard Apple: A genus of the polygynia order, belonging to the polyandria class of plants; and in the natural method ranking under the 52d order, Coadmate. The characters are: The calyst is a triphyllous perianthium: The corolla confifts of fix heart-shaped petals: The stamina have scarcely any filaments; the antherse are numerous, fitting on the receptaculam: The pifillum has a roundish germen; 10 Ryli; the fligmata obtuse and numerous: The periearpium is a large roundish unilocular berry, covered with a scaly bark : The feeds are numerous.

Species. 1. The reticulata, or custard apple, is a mative of the West Indies, where it grows to the height of 25 feet, and is well furnished with branches on every fide: the bark is fmooth, and of an ash colour; the leaves are of a light green, oblong, and have feveral deep transverse ribs or veins, ending in acute points: the fruit is of a conical form, as large as a tennis ball, of an orange colour when ripe, having a foft, fweet, yellowish pulp, of the confistence of a custard, from whence it has its name. 2. The muricata, or four for, rarely rifes above 20 feet high, and is not fo well furnished with branches as the other; the leaves are broader, have a smooth surface without any furrows, and are of a shining green colour: the fruit is large, of an eval shape, irregular, and pointed at the top, of a greenish yellow colour, and full of small knobs on the outside; the pulp is fost, white, and of a sour and fweet taste intermixed, having many oblong, dark co-F 2

loured

Agnona loured feeds. 3. The squamosa, or sweet sop, seldom rifes higher than 15 feet, and well furnished with branches on every side. The leaves have an agreeable fcent when rubbed; the fruit is roundish and scaly, and when ripe turns of a purple colour, and hath a fweet pulp. 4. The palustris, or water apple, grows to the The leaves are oblong, height of 30 or 40 feet. pointed, with some slender furrows, and have a strong icent when rubbed; the fruit is seldom eaten but by negroes, The tree grows in moist places in all the West India islands. 5. The cherimola, with oblong fealy fruit, is a native of Peru, where it is much cultivated for the fruit, and grows to be a very large tree well furnished with branches. The leaves are of a bright green colour, and much larger than those of any of the other forts. The fruit is oblong, and scaly on the outfide, of a dark purple colour when ripe, and the flesh is foft and sweet, intermixed with many brown feeds which are fmooth and shining. 6. The Africana, with fmooth bluish fruit. 7. The Asiatica, or purple apple. This grows in some of the French islands, as also in Cuba, in great plenty. The trees rise to the height of 30 feet or more. The fruit is esteemed by the inhabitants of those islands, who frequently give them to fick persons. 8. The triloba, or North American annona, called by the inhabitants papaw, is a native of the Bahama islands, and likewise of Virginia and Carolina. The trunks of the trees are feldom bigger than the small of a man's leg, and are about 10 or 12 feet high, having a fmooth greenish-brown bark. March, when the leaves begin to sprout, the blossoms appear, confishing of fix greenish-white petals. fruit grows in clusters of three, and fometimes of four together: when ripe, they are yellow, covered with a thin fmooth skin, which contains a yellow pulp of a fweet luscious taste. In the middle of this pulp lie, in two rows, twelve feeds, divided by as many thin membranes. All parts of the tree have a rank, if not a fetid smell; nor is the fruit relished by many except neg oes. These trees grow in low shady swamps, and in a very fat foil.

> Culture. The last fort will thrive in the open air in Britain, if it is placed in a warm and sheltered situation; but the plants should be trained up in pots, and sheltered in winter for two or three years till they have acquired firength. The feeds frequently remain a whel year in the ground; and therefore the earth in the pare ought not to be diffurbed, though the plants do not come up the first year. If the pots where those plants are form are plunged into a new hot bed, they will come up much fooner than those that are exposed to the open air. All the other forts require to he kept in a warm stove, or they will not live in this

ANNONÆ PRÆFFCTUS, in antiquity, an extraordinary magistrate, whose business it was to prevent a fearcity of provision, and to regulate the weight and. finenels of bread.

ANNONAY, a small town of France, in the Upper Vivarais, feated on the river Deunre. E. Long. 4. 52. N. Lat. 45. 15.

ANNOT, a small city in the mountains of Provence in France. E. Long. 7. o. N. Lat. 44. 4.

ANNOTATION, in matters of literature, a brief commentary, or remark, upon a book or writing, in or-

der to clear up some passage, or draw some conclusion Allnotta from it.

Annuity.

ANNOTTA. See Anotta.

ANNUAL, in a general fense, an appellation given to whatever returns every year, or is always performed within that space of time.

Annual Motion of the Earth. See Astronomy. ANNUAL Leaves, are such leaves as come up afresh in the spring, and perish in winter. These stand opposed to Evergreens.

Annual Plants, called also simply annuals, are such as only live their year, i. e. come up in the spring and die again in the autumn; and accordingly are to be recruited every year.

ANNUALRENT is used, in Scots law, to denote a yearly profit due by a debtor in a fum of money to a creditor for the use of it.

Right of ANNUALRENT, in Scots law, the original method of burdening lands with a yearly payment for the loan of money, before the taking of interest for money was allowed by flatute.

ANNUEL of Norway, of which mention is made in the acts of parliament of King James III. was an an annual payment of an hundred merks sterling, which the kings of Scotland were obliged to pay to the kings of Norway, in fatisfaction for some pretentions which the latter had to the Scottish kingdom, by virtue of a conveyance made thereof by Malcolm Kenmore, who usurped the crown after his brother's decease. This annuel was first established in 1266; in consideration whereof the Norwegians renounced all title to the fuccession to the isles of Scotland. It was paid till the year 1468, when the annuel, with all its arrears, was renounced in the contract of marriage between King James III. and Margaret daughter of Christian I. king of Norway, Denmark, and Sweden.

ANNUITY, a fum of money, payable yearly, halfyearly, or quarterly, to continue a certain number of years, for ever, or for life.

An annuity is faid to be an arrear, when it continues unpaid after it falls due. And an annuity is faid to be in reversion, when the purchaser, upon paying the price. does not immediately enter upon possession; the annuity not commencing till fome time after.

Interest on annuities may be computed either in the way of simple or compound interest. But compound interest, being found most equitable, both for buyer and feller, the computation by timple interest is univerfally disused.

I. Annuities for a certain time.

PROBLEM I. Annuity, rate, and time, given, to find the amount, or fum of yearly payments, and intereft.

Rule. Make I the first term of a geometrical series. and the amount of il. for a year the common ratio; continue this feries to as many terms as there are years in the question; and the sum of this series is the amount of 1l. annuity for the given years; which, multiplied by the given annuity, will produce the amount fought.

Example. An annuity of 40l. payable yearly, is forborn and unpaid till the end of 5 years: What will then be due, reckoning compound interest at 5 per cent. on all the payments then in arrear?

Annuty.

1: 1.05: 1.1025: 1.157625: 1.21550625? whose fum is 5.525631251.; and 5.25563125 × 40 = 221.02525=221l. os. 6d. the amount fought.

The amount may also be found thus: Multiply the given annuity by the amount of 11. for a year; to the product add the given annuity, and the fum is the amount in two years; which multiply by the amount of 11. for a year; to the product add the given annuity, and the sum is the amount in 3 years, &c. The former question wrought in this manner follows:

40 am. in 1 year.	126.1	am.	in	3	years.
42.00	1 32.405				
40	40				
82 am. in 2 years.	172.405	am.	in	4	years.
1.05	1.05				
86.10	181.02525				
40	40				

126.1 am. in 3 years. 221.02525 am. in 5 years.

If the given time be years and quarters, find the amount for the whole years, as above; then find the amount of 11. for the given quarters; by which multiply the amount for the whole years; and to the product add fuch a part of the annuity as the given quarters are of a year.

If the given annuity be payable half yearly, or quarterly, find the amount of 11. for half a year or a quarter; by which find the amount for the feveral halfyears or quarters, in the same manner as the amount for the feveral years is found above.

PROB. 2. Annuity, rate, and time given, to find the present worth, or sum of money that will purchase the annuity.

RULE. Find the amount of the given annuity by the former problem; and then, by compound interest, find the present worth of this amount, as a sum due at the the end of the given time.

EXAMP. What is the present worth of an annuity of 401. to continue 5 years, discounting at 5 per cent. compound interest?

By the former problem, the amount of the given annuity for 5 years, at 5 per cent. is 221.02525; and by compound interest, the amount of 11. for 5 years, at 5 per cent. is 1.2762815625.

And, 1.2762815625)221.02525000(173.179=

1731. 3s. 7d. the prefent worth fought.

The prefent worth may be also found thus: By compound interest, find the present worth of each year by itself, and the sum of these is the present worth sought. The former example done in this way follows:

1.2762815625)40.000000000(31.3410 1.21550625)40.0000000 (32.9080 1.157625)40.00000 (34-5535 (36.2811 1.1025)40.000 (38.0952 1.05)40.0

> 173.1788 Present worth.

If the annuity to be purchased be in reversion, find first the present worth of the annuity, as commencing

immediately, by any of the methods taught above; and Annally then, by compound interest, find the present worth of that present worth, rebating for the time in reversion; and this last present worth is the answer.

Examp. What is the present worth of a yearly pension or rent of 751. to continue 4 years, but not to commence till three years hence, discounting at 5 per cent.?

```
.05:1::75:1500
1.05 × 1.05 × 1.05 × 1.05 = 1.21550625
1.21550625)1500.00000(1234.05371
 1500
 1234.05371
```

265.94629, present worth of the annuity, if it was to commence immediately.

1.05 × 1.05 × 1.05=1.157625 L. s. d. $1.157625)265.94629(229.7344=229 14 8\frac{1}{2}$

PROB. 3. Present worth, rate, and time given, to find the annuity.

Rule. By the preceding problem, find the present worth of il. annuity for the rate and time given; and then fay, As the present worth thus found to 11. annuity, so the present worth given to its annuity; that is, divide the given present worth by that of 11. annuity.

Examp. What annuity, to continue 5 years will 173l. 3s. 7d. purchase, allowing compound interest at 5 per cent.?

```
.05:1::1:20l.
1.05 × 1.05 × 1.05 × 1.05 × 1.05 = 1.2762815625
1.2762815625)20.00000000(15.6705
       15.6705
        4.3295 present worth of 11. annuity.
4.329)173.179(40l. annuity. Ans.
```

II. Annuities for ever, or freehold Estates.

In freehold estates, commonly called annuities in feefimple, the things chiefly to be considered are, 1. The annuity or yearly rent. 2. The price or present worth.
3. The rate of interest. The questions that usually occur on this head will fall under one or other of the following problems.

PROB. 1. Annuity and rate of interest given, to find the price.

As the rate of il. to il. fo the rent to the price.

EXAMP. The yearly rent of a finall eftate is 401: What is it worth in ready money, computing interest at 31 per cent. ?

As .c35: 1:: 40: 1142.857142=L. 1142 17 1\frac{1}{2}. PROB. 2. Price and rate of interest given, to find the rent or annuity.

As 11. to its rate, so the price to the rent.

EXAMP. A gentleman purchases an estate for 400cl. and has 41 per cent. for his money: Required the rent? As 1:.045::4000:1:180l. rent fought.

PROB. 3. Price and rent given, to find the rate of

interest.

As the price to the rent, so 1 to the rate.

Examp. An estate of 180l. yearly rent is bought fo 4000l.: What rate of interest has the purchaser for his money?

As 4000: 180l. :: 1:.045 rate fought.

PROB. 4. The rate of interest given, to find how many years purchase an estate is worth.

Divide I by the rate, and the quot is the number of

years purchase the estate is worth.

Examp. A gentleman is willing to purchase an estate, provided he can have 2.1 per cent. for his money: How many years purchase may he offer?

.025)1.000(40 years purchase. Ans.

PROB. 5. The number of years purchase, at which an estate is bought or fold, given, to find the rate of interest.

Divide 1 by the number of years purchase, and the

quot is the rate of interest.

Examp. A gentleman gives 40 years purchase for an estate: What interest has he for his money? 40) 1.000 (.025 rate fought.

The computations lutherto are all performed by a fingle divition or multiplication, and it will feareely be perceived that the operations are conducted by the rules of compound interest; but when a reversion occurs, recourfe must be had to tables of annuities on compound

PROB. 6. The rate of interest, and the rent of a freehold estate in reversion, given, to find the present worth or value of the reversion.

By Prob. 1. find the price or present worth of the estate, as if possession was to commence presently; and then, by the Tables, find the present value of the given annuity, or rent, for the years prior to the commencement; fubtract this value from the former value, and the remainder is the value of the reverlion.

Examp. A has the possession of an estate of 1301. per annum, to continue 20 years; B has the reversion of the same estate from that time for ever: What is the value of the effate, what the value of the 20 years poffession, and what the value of the reversion, reckoning compound interest at 6 per cent?

By Prob. 1. .06) 130.00(2166.8666 value of the effate. By Tables 1491.0896 val. of the possession.

675.5770 val. of the reversion.

PROB. 7. The price or value of a reversion, the time prior to the commencement, and rate of interest, given, to find the annuity or rent.

By the Tables, find the amount of the price of the revertion for the years prior to the commencement; and then by Prob. 3. find the annuity which that amount will purchase.

EXAMP. The reversion of a freehold estate, to commence 20 years hence, is bought for 675.577l. compound interest being allowed at 6 per cont .: Required the annuity or rent?

By the Tables the amount of 675.5771. L. for 20 years, at 6 per cent. is 2166.6 By Prob. 2. 2166. \$\infty .06=130.0 rent fought.

III. Life Annuities.

THE value of annuities for life is determined from observations made on the bills of mortality. Dr Halley, Mr Simpson, and Mons. de Moivre, are gentlemen of diffinguished merit in calculations of this kind.

Dr Halley had recourse to the bills of mortality at Ammity. Breslaw, the capital of Silesia, as a proper standard for the other parts of Europe, being a place pretty central, at a distance from the sea, and not much crowded with traffickers or foreigners. He pitches upon 1000 perfons all born in one year, and observes how many of these were alive every year, from their birth to the extinction of the laft, and confequently how many died each year, as in the inft of the following Tables; which is well adapted to Europe in general. But in the city of London there is observed to be a greater disparity in the births and burials than in any other place, owing probably to the vast resort of people thither, in the way of commerce, from all parts of the known world. Mr Simpson, therefore, in order to have a table particularly fuited to this populous city, pitches upon 1280 persons all born in the same year, and records the number remaining alive each year till none were in life.

It may not be improper, however, to observe, that however perfect tables of this fort may be in themselves, and however well adapted to any particular climate, yet the conclusions deduced from them must always be uncertain, being nothing more than probabilities, or conjectures drawn from the usual period of human life. And the practice of buying and felling annuities on lives, by rules founded on fuch principles, may be juftly considered as a fort of lottery or chance work, in which the parties concerned must often be deceived. But as estimates and computations of this kind are now become fashionable, we shall subjoin some brief account of fuch as appear most material.

Dr Halley's Table on the Bills of Mortality at Breslaw.

23	441	47	228	71	64	95	0

From the preceding Tables the probability of the continuance or extinction of human life is estimated as follows.

1. The probability that a person of a given age shall live a certain number of years, is measured by the proportion which the number of persons living at the proposed age has to the difference between the said number and the number of persons living at the given age.

Thus, if it be demanded, what chance a person of 40 years has to live seven years longer? from 445, the number of persons living at 40 years of age in Dr Halley's table, subtract 377, the number of persons living at 47 years of age, and the remainder 68 is the number of persons that died during these seven years; and the probability or chance that the person in the question shall live these 7 years is as 377 to 68, or nearly as 5! to 1. But, by Mr Simpson's table, the chance is something less than that of 4 to 1.

2. If the year to which a person of a given age has an equal chance of arriving before he dies, he required, it may be found thus: Find half the number of persons living at the given age in the tables, and in the column of age you have the year required.

Thus, if the question be put with respect to a perfon of 30 years of age, the number of that age in Dr Halley's table is 531, the half where of is 265, which is found in the table between 57 and 58 years; so that a person of 30 years has an equal chance of living between 27 and 28 years longer.

3. By the tables, the premium of infurance upon

lives may in fome meafure be regulated.

Thus, the chance that a perion of 25 years has to live another year, is, by Dr Halley's table, as 80 to 1; but the chance that a perion of 50 years has to live a year longer is only 30 to 1; and, confequently, the premium for infuring the former ought to be the premium for infuring the latter for one year, as 30 to 80, or as 3 to 8.

PROB I. To find the value of an annuity of 11. for

the life of a fingle person of any given age.

Monf. de Moivre, by observing the decrease of the probabilities of life, as exhibited in the table, composed an algebraic theorem or canon, for computing the value of any annuity for life; which canon we here lay down by way of

RULE. Find the complement of life; and, by the tables, find the value of il. annuity for the years denoted by the faid complement; multiply this value by the amount of il. for a year, and divide the product by the complement of life; then subtract the quot from 1; divide the remainder by the interest of il. for a year; and this last quot will be the value of the annuity sought, or, in other words, the number of years purchase the annuity is worth.

EXAMP. What is the value of an annuity of 11. for an age of 50 years, interest at 5 per cent?

86

50 age given.

36 complement of life.

By the tables, the value is, 16.5468 Amount of 1l. for a year, 1.05

> 827340 1654**6**8

Complement of life, 36)17.374140(.482615 From unity, viz. 1.000000 Subtrati

Interest of 11. .05).517385(10.3477 value fought.

By the preceding problem is constructed the following Table.

The value of 1 l. annuity for a fingle life.

The value of 11. annuity for a fingle life.

Amuity.

The above table shows the value of an annuity of ore pound for a single life, at all the current rates of interest; and is effected the best table of this kind extant, and preferable to any other of a different construction. But yet those who sell annuities have generally one and a half or two years more value, than specified in the table, from purchasers whose age is 20 years or upwards.

Annuities of this fort are commonly bought or fold at fo many years purchase; and the value assigned in the table may be so reckoned. Thus the value of an annuity of one pound for an age of 50 years, at 3 per cent. interest, is 12.51; that is, 121. 10s. or twelve and a half years purchase. The marginal sigures on the left of the column of age serve to shorten the table, and signify, that the value of an annuity for the age denoted by them is the same with the value of an annuity for the age denoted by the numbers before which they sland. Thus the value of an annuity for the age of 9 and 10 years is the same; and the value of an annuity for the age of 6 and 14, for the age of 3 and 24, &c. is the same. The surther use of the table will appear in the questions and problems following.

QUEST. 1. A person of 50 years would purchase an annuity for life of 2001.: What ready money ought he to pay, reckoning interest at $4\frac{1}{2}$ per cent.?

By the table the value of 11. is 10.8

Multiply by 200

Value to be paid in ready money, 2164.00 Anf.

QUEST. 2. A young merchant marries a widow lady of 40 years of age, with a jointure of 300l. a-year, and wants to dispose of the jointure for ready money: What sum ought he to receive, reckoning interest at 3! per cent.?

I N [49

ANN

L.
By the table, the value of 11. is 13.98

Value to be received in ready money, 4194.00 Anf. PROB. 2. To find the value of any annuity for the joint continuance of two lives, one life failing, the annuity to cease.

Here there are two cases, according as the ages of the two persons are equal or unequal.

1. If the two persons be of the same age, work by

RULE. Take the value of any one of the lives from the table; multiply this value by the interest of 11. for a year; subtract the product from 2; divide the foresaid value by the remainder; and the quot will be the value of 11. annuity, or the number of years purchase sought.

EXAMP. What is the value of 100l. annuity for the joint lives of two persons, of the age of 30 years each, reckoning interest at 4 per cent?

By the table, one life of 30 years is 14.68

Multiply by - .04

Subtract the product - 5872

From - - 2.0000

Remains - 1.4128

And 1.4128)14.68(10.39 value of 11. annuity. And 10.39 × 100=1039 the value fought.

2. If the two perions are of different ages, work as

directed in the following

Rule. Take the values of the two lives from the table; multiply them into one another, calling the result the first product; then multiply the said first product by the interest of 11. for a year, calling the result the second product; add the values of the two lives and from their sum subtract the second product; divide the first product by the remainder, and the quot will be the value of 11. annuity, or the number of years purchase said from the

Examp. What is the value of 70l, annuity for the joint lives of two perions, whereof one is 40 and the other 50 years of age, reckoning interest at 5 per cent?

By the table, the value of 40 years is - 11.83
And the value of 50 years is - 10.35

First product, 122.4405
Multiply by - .05
Second product, 6.122025

Sum of the two lives, - - 22.180000 Second product deduct, - - 6.122025

Remainder, - 16.057975 And 16.057975)122.4405(7.62 value of 1l. annuity.

533.40 value fought.

PROB. 3. To find the value of an annuity upon the longest of two lives? that is, to continue so long as either of the persons is in life.

Rule. From the fum of the values of the fingle lives fubtract the value of the joint lives, and the remainder will be the value fought.

EXAMP. What is the value of an annuity of 11. up-Vol. II. Part I.

on the longest of two lives, the one person being 30, Ann and the other 40 years of age, interest at 4 per cent.?

By the table, 30 years is - 14.68

40 years is - 13.20

Value of their joint lives, by Prob. 2. 27.88

Cafe 2. is 9.62

Value fought, - - 18.26

If the annuity be any other than 11. multiply the answer found as above by the given annuity.

If the two persons be of equal age, find the value of

their joint lives by Case 1. of Prob. 2.
PROB. 4. To find the value of the next presentation

to a living.

RULE. From the value of the successor's life subtract the joint value of his and the incumbent's life, and the remainder will be the value of 11. annuity; which multiplied by the yearly income, will give the sum to be paid for the next presentation.

EXAMP. A enjoys a living of 100l. per annum, and B would purchase the said living for his life after A's death: The question is, What he ought to pay for it, reckoning interest at 5 per cent. A being 60, and B 25 years of age?

By the table, B's life is - 13.46

Joint value of both lives, by Prob. 2. is 6.97

The value of 11 appuity 6.40

The value of 11. annuity, - - 6.49
Multiply by - - 100

Value of next presentation, - 649.00
The value of a direct presentation is the same as that of any other annuity for life, and is found for all, by the table; which being multiplied by the yearly income, gives the value sought.

PROB. 5. To find the value of a reversion for ever, after two successive lives; or to find the value of a living after the death of the present incumbent and his succession.

RULF. By Prob. 3. find the value of the longest of the two lives, and subtract that value from the value of the perpetuity, and the remainder will be the value

Examp. A aged 50, enjoys an estate or living of 100l. per annum; B aged 30, is entitled to his lifetime of the same estate after A's death; and it is proposed to sell the estate just now, with the burden of A and B's lives on it: What is the reversion worth, reckoning interest at 4 per cent?

L. By the table, A's life of 50 is 11.34 14.68 B's life of 30 is Sum, 26.02 8.60 Value of their joint lives, found by ? Prob. 2. Cafe 2. is Value of the longest life, 17.42 fub. From the value of the perpetuity, 25.00 7.58 Remains the value of 11. reveition, Multiply by 100 758.00 Value of the reversion,

PROB.

PROB. 6. To find the value of the joint continuance of three lives, one life failing, the annuity to cease.

RULE. Find the fingle values of the three lives from the table; multiply these single values continually, calling the result the product of the three lives; multiply that product by the interest of Il. and that product again by 2, calling the result the double product; then, from the sum of the several products of the lives, taken two and two, subtract the double product; divide the product of the three lives by the remainder, and the quot will be the value of the three joint lives.

Examp. A is 18 years of age, B 34, and C 56; What is the value of their joint lives, reckoning interest at 4 per cent?

By the table, the value of A's life is 16.1, of B's 14.12, and of C's 10.01.

16.1 × 14.12 × 10.01=2275.6, productof the three lives.

91.024

182.048, double product.

Product of A and B, 16.1 × 14.12 × 227.33

A and C, 16.1 × 10.01=161.16

B and C, 14.12 × 10.00=141.34

Sum of all, two and two, Double product fubtract, 529.83 182.048

Remainder, 347.782

And 347.782)2275.600(6.54 value fought.

PROB. 7. To find the value of an annuity upon the longest of three lives.

RULE. From the fum of the values of the three fingle lives taken from the table, fubtract the fum of all the joint lives, taken two and two as found by Prob. 2. and to the remainder add the value of the three joint lives, as found by Prob. 6. and that fum will be the value of the longest life fought.

Examp. A is 18 years of age, B 34, and C 56: What is the value of the longest of these three lives,

interest at 4 per cent?

By the table, the fingle value of A's life is 16.1 fingle value of B's life is 14.12 fingle value of C's life is 10.01

Sum of the fingle values, 40.23

By Prob. 2. the joint value of A and B is 10.76 joint value of A and C is 8.19 joint value of B and C is 7.65

Sum of the joint lives, 26.60

Remainder, - 13.63
By Prob. 6. the value of the 3 joint lives is 6.54

Value of the longest of the 3 lives,
Other problems might be added, but these adduced are sufficient for most purposes. The reader probably may wish that the reason of the rules, which, it must be owned, are intricate, had been affigned: but this could not be done without entering deeper into the subject

than was practicable in this place. See CHANCES.

Annuities (Borrowing upon); one of the methods A inuity employed by government for raising supplies.

N

Of this there are two methods; that of borrowing upon annuities for terms of years, and that of borrow-

ing upon annuities for lives.

During the reigns of King William and Queen Anne, large fums were frequently borrowed upon annuities for terms of years, which were fometimes longer and fometimes shorter. In 1693, an act was passed for borrowing one million upon an annuity of 14 per cent. or of 140,000l. a-year for 16 years. In 1691, an act was passed for borrowing a million upon annuities for lives, upon terms which in the present times would appear very advantageous. But the subscription was not filled up. In the following year the deficiency was made good by borrowing upon annuities for lives at 14 per cent. or at little more than seven years purchale. In 1695, the persons who had purchased those annuities were allowed to exchange them for others of 96 years, upon paying into the exchequer 63 pounds in the hundred; that is, the difference between 14 per cent. for life, and 14 per cent. for 96 years, was fold for 63 pounds, or for four and a half years purchase. Such was the supposed instability of government, that even these terms procured few purchasers. reign of Queen Anne, money was upon different occafions borrowed both upon annuities for lives and upon annuities for terms of 32, of 89, of 98, and of 99 years. In 1719, the proprietors of the annuities for 32 years were induced to accept in lieu of them South Sea flock to the amount of eleven and a half years purchase of the annuities, together with an additional quantity of flock equal to the arrears which happened then to be due upon them. In 1720, the greater part of the other annuities for terms of years both long and flort were subscribed into the same fund. The long annuities at that time amounted to 666,821l. 88. 3 d. ayear. On the 5th of January 1775, the remainder of them, or what was not subscribed at that time, amounted only to 136,453l. 128. 8d.

During the two wars which begun in 1739 and in 1755, little money was borrowed either upon annuities. for terms of years, or upon those for lives. An anuuity for 98 or 99 years, however, is worth nearly as much money as a perpetuity, and should, therefore, one might think, be a fund for borrowing nearly as much. But those who, in order to make family fettlements, and to provide for remote futurity, buy into the public stocks, would not care to purchase into one of which the value was continually diminishing; and such people make a very considerable proportion both of the proprietors and purchasers of stock. An annuity for a long term of years, therefore, though its intrinsic value may be very nearly the same with that of a perpetual annuity, will not find nearly the same number of pur-chasers. The subscribers to a new loan, who mean generally to fell their fubfcription as foon as possible, prefer greatly a perpetual annuity redeemable by parliament, to an irredeemable annuity for a long term of years of only equal amount. The value of the former may be supposed always the same, or very nearly the fame; and it makes, therefore, a more convenient

transferable stock than the latter.

During the two last mentioned wars, annuities, either

for terms of years or for lives, were feldom granted but

28

Annuly. as premiums to the subscribers to a new loan, over and above the redeemable annuity or interest upon the credit of which the loan was supposed to be made. They were granted, not as the proper fund upon which the money was borrowed; but as an additional encouragement to the lender.

> Annuities for lives have occasionally been granted in two different ways; either upon separate lives, or upon lots of lives, which in French are called Tontines, from the name of their inventor. When annuities are granted upon separate lives, the death of every individual annuitant disburdens the public revenue so far as it was affected by his annuity. When annuities are granted upon tontines, the liberation of the public revenue does not commence till the death of all the annuitants comprehended in one lot, which may sometimes confift of twenty or thirty persons, of whom the furvivors succeed to the annuities of all those who die before them; the last furvivor succeeding to the annuities of the whole lot. Upon the same revenue more money can always be raifed by tontines than by annuities for separate lives. An annuity, with a right of survivorship, is really worth more than an equal annuity for a separate life; and from the confidence which every man naturally has in his own good fortune, the principle upon which is founded the success of all lotteries, such an annuity generally sells for something more than it is worth. In countries where it is usual for government to raife money by granting annuities, tontines are upon this account generally preferred to annuities for separate lives. The expedient which will raife most money, is almost always preferred to that which is likely to bring about in the speediest manner *he liberation of the public revenue.

In France a much greater proportion of the public debts confilts in annuities for lives than in England. According to a memoir presented by the parliament of Bourdeaux to the king in 1764, the whole public debt of France is estimated at twenty-four hundred millions of livres; of which the capital, for which annuities for lives had been granted, is supposed to amount to three hundred millions, the eighth part of the whole public The annuities themselves are computed to amount to thirty millions a-year, the fourth part of one hundred and twenty millions, the supposed interest of that whole debt. It is not the different degrees of anxiety in the two governments of France and England for the liberation of the public revenue, which occafions this difference in their respective modes of borrowing; it arises altogether from the different views and interests of the lenders.

In Britain, the feat of government being in the greated mercantile city in the world, the merchants are generally the people who advance money to government. By advancing it they do not mean to diminish, but, on the contrary, to increase their mercantile capitals; and unless they expected to fell with some profit their share in the subscription for a new loan, they never would subscribe. But if l-y advancing their money they were to purchase, instead of perpetual annuities, annuities for lives only, whether their own or those of other people, they would not always be so likely to sell them with a profit. Annuities upon their own lives they would always fell with Tols; because no man will give for an annuity upon the

life of another whose age and state are nearly the same with his own, the same price which he would give for one upon his own. An annuity upon the life of a third person, indeed, is, no doubt, of equal value to the buyer and the feller; but its real value begins to diminish from the moment it is granted, and continues to do so more and more as long as it sublists. It can never, therefore, make so convenient a transferable flock as a perpetual annuity, of which the real value may be supposed always the same, or very nearly the

In France, the feat of government not being in a great mercantile city, merchants do not make fo great a proportion of the people who advance money to government. The people concerned in the finances, the farmers general, the receivers of the taxes which are not in farm, the court bankers, &c. make the greater part of those who advance their money in all public exi-Such people are commonly men of mean birth, but of great wealth and frequently of great pride. They are too proud to marry their equals, and women of quality disdain to marry them. They frequently refolve, therefore, to live bachelors; and having neither any families of their own, nor much regard for those of their relations, whom they are not always very fond of acknowledging, they defire only to live in fplendour during their own time, and are not unwilling that their fortune should end with themselves. The number of rich people, belides, who are either averle to marry, or whose condition of life renders it either improper or inconvenient for them to do fo, is much greater in France than in England. To fuch people, who have little or no care for posterity, nothing can be more convenient than to exchange their capital for a revenue, which is to last just as long, and no longer, than they wish it to do.

ANNUITY of TEINDS, in Scots law, a certain proportion of the teinds of crected benefices formerly payable to the crown, but now gone into difuse.

ANNULAR, in a general sense, something in the form of, or refembling, a ring. It is also a peculiar denomination of the fourth finger, commonly called the ring finger.

ANNULET, in architecture, a small square member in the Doric capital, under the quarter round.

Annuler is also a narrow flat moulding, which is common to divers places of the columns, as in the bafes, capitals, &c. It is the same member which Vitruvius calls a fillet; Palladio, a listil or cinaure; Scamozzi, and Mr Brown, a fupercilium, lift, tinca, eyebrow, fquare, rabbit. See Architecture.

Annuler, a little circle, borne as a charge in coats of arms, as also added to them as a difference. An.ong the Romans it represented liberty and nobility. It also denotes strengthand eternity, by reason of its circular form.

When this figure is added as a difference, some authors affert, that it ferves to remind the bearer to achieve great action .

ANNULLING, a term sometimes used for cancelling or making void a deed, fentence, or the like.

ANNUNCIADA, ANNUNTIADA, OF ANNUNCIA-TA, an order of knighthood in Savoy, first instituted by Amadeus I. in the year 1409: their collar was of 15 links, interwoven one with another, in form of a true lover's knot; and the motto, F. E. R. T. fignifying.

enun-Inolymprades.

Fortitudo ejus Rhodum tenuit. Amadeus VIII. gave the name Annunciada to this order, which was formerly known by that of the knot of love; changing at the fame time the image of St Maurice patron of Savoy, which hung at the collar, for that of the Virgin Mary; and, instead of the motto above-mentioned, substituting the words of the angel's falutation.

Annunciada is also the title of several religious orders, instituted at different times, and at different places, in honour of the annunciation. See the next article.

ANNUNCIATION, the tidings brought by the angel Gabriel to the Virgin Mary of the incarnation of Christ.

Annunciation is also a festival, kept by the church on the 25th of March, in commemoration of these tid-This fellival appears to be of very great antiquity. There is mention made of it in a fermon which goes under the name of Athanefius. Others carry it up to the time of Gregory Thaumaturgus, because there is a fermon likewife attributed to him upon the tame subject. But the best critics reject both these writings as spurious. However, it is certain, this feftival was observed before the time of the council of Trullo, in which there is a canon forbidding the celebration of all festivals in lent, excepting the Lord's day, and the feast of the annunciation: so that we may date its original from the seventh century.

In the Romish church, on this feast, the pope performs the ceremony of marrying or cloiftering a certain number of maidens, who are presented to him in the church, clothed in white ferge, and muffled up from head to foot: An officer stands by, with purses containing notes of 50 crowns for those who make choice of marriage, and notes of a hundred for those who choose to veil.

Annunciation is likewife a title given by the Jews

to part of the ceremony of the passover.

ANNUNCIATOR, the name of an officer in the church of Constantinople. It was his business to inform the people of the fellivals that were to be celebrated.

ANODYNE, (from a privative, and odorw, doleo; or a neg. and woven, pain), a term applied to medicines which eafe pain, and procure fleep. They are divided into three forts, viz. 1. Paregones, or fuch as affuage pain. 2. Hypnotics, or fuch as relieve by procuring sleep. 3. Narcotics, or such as ease the patient by stupifying him.

Opiates and narcotics destroy sensation. Some hypnotics and paregories, as nitre, camphor, &c. procure eafe and fleep by removing the offending cause. Camphor is faid to be the best anodyne in nervous cases and at the decline of fevers. The doles of these medicines

are generally regulated by the pulfe.

ANOINTERS, a religious fect in some parts of England, so called from the ceremony they used of anointing all perfons before they admitted them into their church. They founded their opinion of anointing upon the fifth of James, ver. 14. and 15.

ANOLYMPIADES, in antiquity, a name given by the Elians to those Olympic games which had been celebrated under the direction of the Pifæans and Arerdians. The Ehans claimed the fole right of managing the Olympic games, in which they fometimes met with competitors. The hundred and fourth Olymplad was celebrated by order of the Arcadians, by

whom the Elians were at that time reduced very low: Ahomalithis, as well as those managed by the inhabitants of Pifa, they called avoluntiadas, that is, "unlawful Olym- Anomocpiads;" and left them out of their annals, wherein the names of their victors and other occurrences were registered.

ANOMALISTICAL YEAR, in aftronomy, the time that the earth takes to pass through her orbit: it is also called the Periodical Year. The space of time belonging to this year is greater than the tropical year, on account of the procedion of the equinoxes. See ASTRONOMY.

ANOMALOUS, a term applied to whatever is irregular, or deviates from the rule observed by other

things of the like nature.

Anomatous Verbs, in grammar, fuch as are not conjugated conformably to the paradigm of their conjugation. They are found in all languages. In Latin, the verb lego is the paradigm of the third conjugation; and runs thus, lego, legis, legit: by the fame rule it should be fero, feris, ferit; but we say fero, firs, fert: fero, then, is an anomalous verb. In English the creegularity relates often to the preter tenfe and paffic. participle: for example, give, were it formed ac ording to rule, would make gived in the preter ten and palfive participle; whereas, in the former, it masses were, and in the latter given.

ANOMALY, in altronomy, an irregal ty in the motion of the planets, whereby they deviate from the

aphelion or apogee.

ANOMIA, in zoology, a genus of infects belonging to the order of vermes tellacea. The shell is bivalve, and the valves are unequal. One valve is perforated near the hinge; affixed by that perforation to fome other body. There are 25 species of the anomia; of which only two are natives of the British feas, viz. 1. The ephippium, with the h.bit of an oyfler; the one fide convex, the other flat; perforated; adherent to other bodies, often to oyller bells, by a strong tendinous ligature; colour of the inade perlaceous. Size, near two inches diameter. 2. The fquammula, with shells resembling the scales of fish; very delicate, and filvery; much flatted; perforated; very fmall. Adheres to oysters, crabs, lobsters, and shells. This species of the genus are commonly called Beaked Cockles. No name has been given to the fifth that inhabits it; for the recent shells of this kind are so very rare, that there is fearcely one to be found perfect. They are perhaps, as well as that which has given its form to the cornu ammonis, inhabitants of the deepett parts of the ocean; confequently it must be some extraordinary agitation of that great body of water that can bring them at all to our knowledge in their recent ftatc.

The fosfil species of the Anomia genus are uncommonly numerous in this island, in our chalk pits and limestone quarries; and in Gloucestershire they are as common on the ploughed lands as pebbles on other places.

ANOMOEANS, in ecclefiaftical history, the name by which the pure Arians were called in the fourth century, in contradiffinction to the Semi-Arians. The word is formed from the Greek, aropeois, different, dissimilar: For the pure Arians afferted, that the Son was of a nature different from, and in nothing like,

Anonlor- that of the Father: whereas the Semi-Arians acknowhomboida ledged a likeness of nature in the Son; at the same time that they denied, with the pure Arians, the con-And San Inbitantiality of the Word. The Semi-Arians condemned the Anomorans in the council of Seleucia; and the Anomoans in their turn condemned the Semi-Arians in the councils of Conftantinople and Antioch, erating the word openes, like, out of the Formula of Rimini and that of Constantinople.

> ANOMORHOMBOIDIA, in natural history, the name of a genus of spars; the word is derived from the Greek avapanes, irregular, and gopooides, a rhombuidal figure. The bodies of this genus are pellucid crystalline spars of no determinate or regular external form, but always breaking into regularly rhomboidal maffes; eafily fiffile, and composed of plates running both horizontally and perpendicularly thro' the maffes, but cleaving more readily and evenly in an horizontal, thro in a perpendicular direction; the plates being ever composed of irregular arrangements of rhomboidal concretions. Of this genus there are five known species. 1. A white, bright, and shattery one; found in great quantities in the lead mines of Derbyshire, Yorkthus, and Wales. 2. A milk-white, opaque, and shatte v one, found in some parts of France, and very pleat fully in Germany, and fometimes in Wales and S offend, and in the hills of Yorkshire. 3. A hard, dull, and from white one, found in fome of the mines in Derbythire, and in many of our northern counties. 4. A hard gray and pellucid one, found in the lead mines of Yorkshire, and very common in Germany. And, 5. A pellucid and colourless one; this is found in the lead mines of Derbythire and Yorkthire. All thefe in forme degree have the double refraction of the island cryftal. See Isi ND cryffal.

ANONIS, in botany. See Ononis.

ANONYMOUS, fomething that is nameless, or of which the name is concealed. It is a term usually applied to books which do not express the author's name, or to authors whole names are unknown.

Anonymous in Commerce. Partnerships in trade in France are flyled anonymous, when they are not carried on under any particular name, but wherein each of the partners trades visibly on his own account, and in his own name; after which all the partners give one another an account of their profit or loss in trade. These forts of partnerships are concealed, and known only to the parties themselves.

ANDNYMOUS Partnerskips in Trade, are also in France, fuch, wherein persons of fortune and quality deposite fums of money, in order to share of the profits and loss. To this end those who farnish the capital have no trouble in carrying on the trade, nor do their names appear to be any way interested therein.

Anony mous, in law. The fending anonymous letters demanding money, &c. is felony by the Black Act, 9 Geo. I. Cap. XXII.

ANOREXIA, ANOREXY, (from a negative, and mertie, appetite); a want of appetite, or a loathing of food. The disorder is either original or symptomatic. When it is original, its causes are ball diet, too free drinking, voraciousness, &c.: In which cases, a vomit or two of ipecacuanha may be taken; and temperance, a light but cordial nourishing diet, and daily exercise, perfifted in, will generally effect a recovery. But it is

more frequently a symptom of some other disorder; and then the cure depends on the removal of the original one.

ANOSSI, a province of the island of Madagascar, lying between Lat. 23. 18. and 26. o. S. It is watered by many rivers, most of which run into the Franchere, Ramewatte, or Immour, the spring of which is in a mountain called Manghage, and discharges itself nato the sea in Lat. 25. 18. S. The mouth of this river is often stopped, and the course to the sea interrupted, unless kept open by the overflowings of great rains and high tides. The water runs falt one league above the mouth, particularly in a free communication with the sea. A lake, called Ambou, is formed at the mouth, half a league wide, with depth fusicient for any ship if the mouth of the river was kept open. Next in bigness to the Franchere, is the Manghafia, which springs from a mountain called Siliva, and empties itself into the fea, where large ships may ride at anchor. Crocodiles breed

in these and all the other rivers of the sland. Between the two rivers above mentioned lies Cape St Romain, half a mile distant from the mouth of the Franchere, and which runs from the north-west fix or feven leagues into the fea. When the cape is passed the coast forms a great bay, in the shape of a cross, which extends to the mouth of a river called Dian Panuage or Pitorah. In the middle of this bay the land runs out, and almost forms a peninfula called Tholangare. Fort Daupkin lies to the north of this peninfula, and Port Dauphin over against it. This province has feveral other peninfulas and fmall islands belonging to it. The country is beautiful; abounds in fruit trees; is fertile in passures for cattle; and, if carefully cultivated, would produce all the necessaries of life. It is furrounded by high mountains, which are covered with woods and fhrubs; but, about four miles distant from Fort Dauphin, the adjacent hills are quite destitute of verdure. The French often dug in this neighbourhood, expecting to meet with mines of gold and filver, particularly in one mountain where feveral fprings flow near each other and empty themselves into a neighbouring river. In this river they found feveral stones and heaps intermixed with yellow clay, with a great quantity of black and white spangles shining like filver, which they carefully pounded and washed, but without *effect. About 60 yards above thefe fprings the grafs. and every fort of vegetable, appears half dried and yellow, from a metalline fulphur, which gives that afpect: but the top of the mountain is covered with a fresh and beautiful verdure. It is faid that the Portuguefe found gold at the foot of this mountain on the north fide, but that the place they had dug was filled up by the chiefs of the country after the Portuguese had been driven out.

The province of Anossi is inhabited by three different forts of whites, and four forts of negroes. The whites are distinguished by the names of Rolandrians, Anceandrians, and Ondzath. The whites are diffinguished from the negroes by the general name of Zaferamini, or Rahimini; and the Rohandrians are distinguished above the other whites. When they proecced to an election of a fovereign, whom they call Ompiandrian, or Dian Baksuache, he is chosen from the Rohandrian race. Next to him the others hold the rank of princes, and are honoured as fuch by all the

Ano. rest of the subjects. The Anacandrians are descendants of the chiefs, but who have degenerated, and are accounted the bastards of princes, or those who are descended from a Rohandrian and any inferior white or black woman. These are likewise called by the name of Ontempassemaca, or people from the fandy parts of Mecca, from whence, they fay, came the Rohandrians. Both the Rohandrians and Anacandrians wear long hair, which hangs down in curls; and enjoy the privilege of killing beafts. The Ondzatsi, or lowest class of whites, are descended from the bastards of the Anacandrians. These are all sishermen, and are allowed to kill no land animal except a chicken.

The four classes of negroes are named Voadziri, Lohavohits, Ontfoa and Ondeves. The Voadziri, the most powerful and the richeft, are masters of several villages, and descended from the original lords of the country. They enjoy the privilege of killing beafts, when at a distance from the whites, and no Rohandrian or Anacandrian in the village. The Lohavohits are descendants from the Voadziri, and also lords; but with this difference, that the one commands a whole district, and the jurifdiction of the others extends only to their own village and family. They are also permitted to kill those beasts they intend to eat, when at a distance from the whites. The Ontsoa are next to the Lohavohits, and are their near relations. The Ondeves are the lowest of all, being originally flaves by father and mother. The Voadziri, Lohavohits, and Ontfoa, enjoy the privilege of submitting themselves, on the death of their lord or king, to any chief they please. In return for such homage, the new lord mades them a prefent, in confequence of which he becomes heir to all their possessions. Hence the lower classes both of whites and blacks, when death approaches, are under the greatest concern and anguish of mind, well knowing that their lords will not fail to deprive their children of every thing they possels. The Onderes have not the same liberty with the others; but, in times of famine, the chiefs are obliged to supply them with necessaries; which if they fail to do, they have the liberty of fubmitting themselves to new masters. The inhabitants of this province have no temples, and very little appearance of religion; only they keep up a custom of immolating beafts upon particular occasions, as in sickness, planting yams or rice, on affemblies, &c. They offer the first-born beast to the devil and to God, naming the devil first, in this manner, Dianbilis Aminhanhabare, or " Lord Devil and God."—There are feveral towns on the river Franchere; and near this river the Portuguese had a fort built upon a steep rock, and several buildings below, with enclosures, which furnished all forts of necessaries for their subsistence; but they were all masfacred by the natives.

This province seems originally to have been inhabited by negroes. The whites or Zaferamini settled in it about 200 years ago, and conquered the negroes. But they themselves were conquered by the French, though under the government of a king whom they honoured as a god. In 1642, Captain Rivault obtained a permiftion to establish a colony in this part of the island; and accordingly he took possession of it in the name of the king of France, in the month of September, that same year. The French landed 200 men, well armed, and provided with flore of ammunition and other necessaries

for building a fort, which they immediately fet about; Anotta. but no fooner did the natives observe their intention, than they used their utmost art to prevent their design from taking effect. This created a war, in which the French were victors; and, the natives becoming in time much better reconciled to them, they intermarried, and lived up and down in feveral towns at some distance from one another, not above five or fix in a place. This tranquillity lasted for some years; but at last the natives, growing jealous, resolved to free themselves from a foreign yoke; and accordingly formed a conspiracy to cut off all the French in one day; which they foon after effected, not leaving a fingle person alive. In 1644 the above mentioned Fort Dauphin was erected in Lat. 25. 6. S. Many buildings were erected, behind the fort, adjoining to the governor's house, with great enclosures that produced every fort of fruit and kitchen herb. In 1656 this fort was accidentally destroyed by fire; but was foon after repaired, and still continues, notwithstanding the catastrophe above mentioned, and its garrison carries on frequent wars with the natives.

ANOTTA, or ARNOTTA, in dyeing, an elegant red colour, formed from the pellicles or pulp of the feeds of the Bixa, a tree common in South America. It is also called Terra Orleana, and Roucou.

The manner of making anotta is as follows: The red feeds, cleared from the pods, are steeped in water for feven or eight days, or longer, till the liquor begins to ferment; then strongly stirred, stamped with wooden paddles and beaters, to promote the separation of the red skins; this process is repeated several times, till the feeds are left white. The liquor, passed through close cane sieves, is pretty thick, of a deep red colour, and a very ill fmell; in boiling, it throws up its colouring matter to the furface in form of fcum, which is afterwards boiled down by itself to a due confishence, and made up while foft into balls. The anotta commonly met with among us, is moderately hard and dry, of a brown colour on the outside, and a dull red within. It is difficultly acted upon by water, and tinges the liquor only of a pale brownish yellow colour. In rectified spirit of wine, it very readily dissolves, and communicates a high orange or yellowish red. Hence it is used as an ingredient in varnishes, for giving more or less of an orange cast to the simple yellows. Alkaline salts render it perfectly foluble in boiling water, without altering its colour. Wool or filk boiled in the folution acquire a deep, but not a very durable, orange dye. Its colour is not changed by alum or by acids, any more than by alkalis: but when imbibed in cloth, it is discharged by soap, and destroyed by exposure to the air. It is faid to be an antidote to the poisonous juice of manioc or cassava. Labat informs us, that the Indians prepare an anotta greatly superior to that which is brought to us, of a bright shining red colour, almost equal to carmine: that, for this purpose, inflead of fleeping and fermenting the feeds in water, they rub them with the hand, previously dipped in oil, till the pellicles come off, and are reduced into a clear paste; which is scraped off from the hands with a knife, and laid on a clean leaf in the shade to dry. De Laet, in his notes on Margrave's Natural History of Brazil, mentions also two kinds of anotta; one of a permanent crimson colour, used as a fucus or paint for the face; and another which gives a colour inclining

more to that of fassron. This last, which is our anotta, he supposes to be a mixture of the first sort with cer-Anfarians, tain refinous matters, and with the juice of the root of the tree. The wax or pulp in which the feeds are enclosed is a cool agreeable rich cordial, and has been long in use among the Indians and Spaniards in America, who still mix it with their chocolate, both to heighten the flavour and raise the colour. It is said to be a fuccessful remedy in bloody fluxes. The roots bave much the fame properties with the wax; but these are observed to work more powerfully by the urinary passages: they are used by some people in their broths, and feem to answer all the purposes of the pulp, but in a more faint degree. See BIXTA.

ANOUT, a small island in the Schagerrack, or that part of the fea of Denmark which has Norway on the north, Jutland on the west, and the isle of Zeeland on the fouth; it lies in 13. o. E. Long. and 56. 36. N. Lat.

ANSÆ, in aftronomy, implies the parts of Saturn's ring projecting beyond the disk of the planet .- The word is Latin, and properly fignifies bandles: these parts of the ring appearing like handles to the body of the planet.

ANSARIANS, a people of Syria, so called in the country, but styled in De l'Isle's maps Ensarians, and in those of D'Anvill, Nassaris. The territory occupied by these Ansaria is that chain of mountains which extends from Antakia to the rivulet called Nahr-el-Kabir. or the Great River. The history of their origin, though little known, is yet instructive. The following account is from the Bibliotheque Orientale of Assemani, a writer who has drawn his materials from the best authorities.

" In the year of the Greeks 1202 (A. D. 891), there lived at the village of Natar, in the environs of Koufa, an old man, who, from his fastings, his continual prayers, and his poverty, passed for a faint: several of the common people declaring themselves his partizans, he selected from among them twelve disciples to propagate his doctrine. But the commandant of the place, alarmed at his proceedings, feized the old man, and confined him in prison. In this reverse of fortune, his fituation excited the pity of a girl who was flave to the gaoler, and she determined to give him his liberty: an opportunity foon offered to effect her defign. One day when the gaoler was gone to bed intoxicated, and in a profound fleep, the gently took the keys from under his pillow, and after opening the door to the old man, returned them to their place unperceived by her master: the next day when the gaoler went to vifit his priloner, he was extremely aftonished at finding he had made his escape, and the more so fince he could perceive no marks of violence. therefore judiciously concluded he had been delivered by an angel, and eagerly spread the report, to avoid the reprehension he merited: the old man, on the other hand, afferted the same thing to his disciples, and preached his doctrines with more earnestness than ever... He even wrote a book, in which, among other things, he fays, 'I, fuch a one, of the village of Nafar, have feen Christ who is the word of God, who is Ahmad, ion of Mohammed, son of Hanafa, of the race of Ali; who also is Gabriel: and he said to me, Thou art he who readeth (with understanding); thou art the man who speaketh truth; thou art the camel which preferveth the faithful from wrath: thou art the beaft Anfun which carrieth their burden; thou art the (Holy) Spirit, and John, the fon of Zachary. Go, and preach As to men that they make four genuflections in praying; two before the rifing of the fun, and two before his fetting, turning their faces towards Jerusalem: and let them fay, three times, God Almighty! God Most High! God Most Great! Let them observe only the second and third festival; let them fast but two days annually; let them not wash the prepuce, nor drink beer, but as much wine as they think proper; and laftly, let them abitain from the flesh of carnivorous animals. This old man passing into Syria, propagated his opinions among the lower orders of the country people, numbers of whom believed in him: And after a few years he went away, and nobody ever knew what became of him."

Such was the origin of these Ansarians, who are, for the most part, inhabitants of the mountains beforementioned.

The Ansaria are divided into several tribes or sects; among which are diffinguished the Shamsia, or adorers of the fun; the Kelbia, or worthippers of the dog; and the Kadmousia, who are said to pay a particular homage to that part in women which corresponds to the priapus.

Many of the Anfaria believe in the metempfychosis; others reject the immortality of the foul; and in general, in that civil and religious anarchy, that ignorance and rudeness which prevail among them, these peafants adopt what opinious they think proper, following the feet they like bett, and frequently attaching themselves to none.

Their country is divided into three principal difricts farmed by the chiefs called Mokaddaminn. Their tribute is paid to the pacha of Tripoli, from whom they annually receive their title. Their mountains are in general not so steep as those of Lebanon, and consequently are better adapted to cultivation; but they are also more exposed to the Turks; and hence, doubtless, it happens, that with greater plenty of corn, tobacco, wines, and olives, they are more thinly inhabited than those of their neighbours the Makonites and the DRUZES.

ANSE, an ancient town of France, in the Lyonois, ten miles north of Lyons. Long. 6. 55. N. Lat. 45. 55.

ANSELM, archbishop of Canterbury, in the reigns of William Rufus and Henry I. He was born in the year 1033, at Aoil, a town in Savoy at the foot of the Alps. He became a monk in the Abbey of Bec in Normandy; of which he was afterwards chofen prior, and then abbot. In the year 1092, he was invited over to Eugland by Hugh earl of Cheller; and in the year following was prevailed on, as we are told, with great difficulty, to accept the archbishopric of Canterbury. He enjoined celibacy on the clergy; for which he was banished by King Rufus, but recalled by Henry at his coming to the crown. He refused to confecrate such bishops as were invested by the king, according to Pope Urban's decree; flatly denying it to be the king's prerogative: for this he was outed again; till, the pope and king agreeing, he was recalled in 1107. In short, from the day of his confecration to that of his death, he was continually employed in fighting the prerogative of the church against that of the crown; and for that purpose Anfibarii.

fpent much of his time in travelling backwards and forwards between England and Rome, for the advice and direction of his Holiness. At the council of Bari, in the kingdom of Naples, the pope being puzzled by the arguments of the Greeks against the Holy Ghost's proceeding from the Father, he called upon Anfelm, who was prefent, and he discussed their objections with great applause. Priests call him a resolute faint; to other people he appears to have been an obstinate and infolent priest. He wrought many miracles, if we believe the author of his life, both before and after his death, which happened at Canterbury, in the 76th year of his age, anno 1109. He was canonized in the reign of Henry VII. Anfelm, though we may difregard him as a faint, deferves to be remembered as one of the principal revivers of literature, 'after three centuries of profound ignorance.

His works have been printed in different years, and at different places, viz. Nuremb. 1491. Paris 1544 and 1549. Venice 1549. Cologne 1573 and 1612. Lyons 1630. But the best is that of Farher Gerberon, printed at Paris 1675. It is divided into three parts; the first contains dogmatical tracts, and is entitled Monologia; the second contains practical and devotional tracts; the third part consists of letters, in four books.

ANSER, in ornithology, the trivial name of a species of anas. See Anas.

Anser, in astronomy, a small star, of the fifth or fixth magnitude, in the milky way, between the swan and eagle, first brought into order by Hevelius.

ANSERES, the name which Linnaus gives to his third order of birds. See Zoology, No 8.

ANSIBARII, or Ansivarii, an ancient people of Germany, fituated fomewhere in the neighbourhood of the Chauci. All we know of their history is, that, in the reign of the emperor Nero, they were driven from their own possessions by the Chauci. Being then in a forlorn condition, they took possession of some uninhabited lands, which had been used as pasture for the horses of the Roman foldiers. They were led by one Boiocalus, a man of great valour, and of known fidelity to the Romans. He remonstrated to the Romans, who objected to their taking possession of these lands, That the territory in dispute was large; and requested, that it might be allowed to an unhappy people driven from their own habitations: that, at the same time, wide tracts might be retained for the horses and cattle of the foldiers to graze in; that it was inconfistent with humanity to famish men in order to feed beasts, &c. and at last, lifting up his eyes to heaven, he asked the celeftial luminaries how they could behold a defolate foil, and if they would not more juftly let loofe the fea to fwallow up usurpers, who had engroffed the whole earth? To this the Roman commander, Avitus, replied, That the weakest must submit to the strongest; and that fince the gods, to whom they had appealed, had left the fovereign judgment to the Romans, they were resolved to suffer no other judges than themselves. To Boiocalus himfelf, however, he privately offered lands as a reward for his long attachment to the Romans: but this offer the brave German rejected, as a price for betraying his people; adding, "A place to live in we may want, but a place to die in we cannot." The Anfibarii now invited the neighbouring nations to join them against the Romans; but they, dreading the power of that nation, refused to give them any assistance: upon which they applied to the neighbouring nations, begging leave to settle in their territories; but being everywhere driven out as enemies and intruders, these unhappy people were reduced to wander up and

down till every one of them perished. ANSIKO, a kingdom of Africa, bounded on the west by the river Umbre which runs into the Zaire, the kingdom of Wangua, and the Amboes who border on Loango; on the north, by some deferts of Nubia; and on the fouth, by Songo and Sonda, provinces of Congo. Here are great numbers of wild beafts, as lions, rhinocerofes, &c. and many copper mines. The king of Anfiko, or the great Macoco, commands 13 kingdoms, and is effected the most powerful monarch in Africa. The inhabitants of Angola have a tradition, that this is the proper country of the Giagas, who came originally from Sierra Leona, and over-ran like a torrent the whole coast as far as Benguela; that, being weakened by numerous battles, and unable to force the defiles in order to return to Sierra Leona, they arrived on the borders of Monomotapa, where being defeated, they were forced to remain in the provinces of Ansiko. Be this as it will, the Anfikans yield not in the least to the Giagas in sierceness and barbarity. They are so accustomed to the eating of human flesh, that it is afferted they have markets where it is publicly fold, and that there are no other graves for the dead than the bellies of the living. They try the courage of their prisoners of war by shooting at them as at marks, directing their arrows above or around their heads; and whoever discovers the least figns of fear, is immediately devoured without remedy. Those who appear intrepid and resolute, have their nofes and cars bored, and two fore teeth of the upper jaw drawn. They are then improved in barbarity, by

accustoming them to the most horrid cruelties. The Anfikans are neat, well proportioned, and ftrong; wandering about from place to place, without either fowing or reaping. They are dreaded for their extreme brutality, and never traded with by the Europeans. Their language is barbarous, and difficult to be learned, even by the inhabitants of Congo. The most diffinguished among them wear red and black caps of Portuguese velvet: the lower ranks go naked from the waift upwards; and, to preferve their health, anoint their bodies with a composition of pounded white sandal wood and palm oil. Their arms are battle axes, and fmall but very ftrong bows adorned with ferpents Their strings are made of supple and tender shoots of trees, that will not break, and their arrows of hard and light wood. These people, who kill birds flying, shoot with such surprising swiftness, that they can discharge 28 arrows from the bow before the first falls to the ground. With equal dexterity they manage their battle axes; one end of which is sharpened and cuts like a wedge, and the other flattened like a mallet, with a handle fet between, about half the length of the iron, rounded at the end like an apple, and covered with the skin of a serpent.-The current money in this country is the zimbis or shell, which is fished for, and passes among several African nations .-They worship the sun as their chief deity; whom they represent by the figure of a man, and the moon by that of a woman. They have also an infinite number of inferior deities, each individual having a particular idol whom he addresses on certain occasions.

ANSLO, a fea port town of Norway, in the province of Aggerhuys, with a bishop's see. The supreme court of justice is held here for Norway. It is feated on a bay of the same name. E. Long. 10. 14. N. Lat. 50. 24

ANSÓN (George), a gentleman whose merit and good fortune, as a naval commander, exalted him to the rank of nobility. He was the fon of William Anson, Esq. of Huckborough, in Staffordshire Land, showing an early inclination for the sea, received a suitable education. The first command he enjoyed was that of the Weafel floop in 1722; but the most memorable action of his life, and the foundation of his future good fortune, took place on his receiving the command of five ships, a sloop, and two victuallers, equipped to annoy the Spaniards in the South feas, and to co-operate with Admiral Vernon across the isthmus of Darien; an expedition the principal object of which failed by the unaccountable delay in fitting him out. He failed, however, in Sept. 1740; doubled Cape Horn in a dangerous feason; lost most of his men by the scurvy; and with only one remaining ship, the Centurion, crossed the great Pacific ocean. If no confiderable national advantage refulted from this voyage, Commodore Anfon made his own fortune, and enriched his furviving companions, by the capture of a rich galleon on her passage from Acapulco to Manilla; with which he returned home round the Cape of Good Hope. If he was lucky in meeting this galleon, he was no less for-tunate in escaping a Freuch sleet then cruising in the Channel, by failing through it during a fog. He arrived at Spithead in June 1744. In a short time after his return, he was appointed rear-admiral of the blue, and one of the lords of the admiralty. In April 1745, he was made rear-admiral of the white, and the following year vice-admiral of the blue; at which time he was chosen to represent the borough of Heydon in parliament. In 1747, being on board the Prince George of 90 guns, in company with Admiral Warren, and 12 other ships, he intercepted, off Cape Finisterre, a powerful fleet, bound from France to the East and West Indies; when, by his valour and conduct, he again enriched himself and his officers, and at the same time strengthened the British navy, by taking fix men of war and four East Indiamen, not one of them escaping. The French admiral, M. Jonquiere, on presenting his sword to the conqueror, said, Monfieur, vous avez vaincu l'Invincible, et la Gloire vous fuit: "Sir, you have conquered the Invincible, and Glory follows you;" pointing to the ships, named the Invincible and the Glory, he had taken. For his fignal services, his late majesty created him baron of Soberton in Hants. The same year he was appointed vice-admiral of the red; and, on the death of Sir John Norris, was made vice-admiral of England. In 1748 he was made admiral of the blue: he was afterwards appointed first lord of the admiralty, and was at length made admiral and commander in chief of his majefty's fleet; in which rank he continued, with a very short interval, until his death; and the last service he performed was to convoy Queen Charlotte to England. He died in June 1762. No performance ever met with a more tavourable reception, than the account of Anion's Vol. II. Part I.

voyage round the world. Though it is printed under Anfpair the name of his chaplain, it was composed under his lordship's own inspection, and from the materials he himself furnished, by the ingenious Mr Benjamin Ro-

ANSPACH (the marquifate of), a small territory of Franconia, in Germany, bounded on the north by the bishoprics of Wartsburg and Bamberg, which last likewise lies to the west; by the earldoms of Holach and Oeting, with the bishopric of Aichstet, on the fouth; and the palatinate of Bavaria and the territory of Nuremberg on the east. The country is fruitful, and interspersed with woods, which render it agreeable for hunting. Besides the city Anspach, which is the capital, the chief towns are Kreglin, Swasbach, Kreilfheim, Rot, and Wasser-Truding.

Anspach, is a small but pretty town, very well built, and has feveral churches. It is walled round, but has no other fortifications. In the palace there is a remarkable cabinet of curiofities. It is feated on a river of the fame name, and belongs to the house of Brandenburg.

E. Long. 10. 42. N. Lat. 49. 14.

ANSPESSADES, in the French armies, a kind of inferior officers in the foot, below the corporals, but above the common centinels. There are usually four or five of them in a company.

ANSTRUTHER Easter and Wester, two royal boroughs of Scotland, fituated on the fouth-east coast of the county of Fife, in W. Long. 2. 25. N. Lat. 56. 20.

ANT, in zoology. See Formica and Termes. ANT-Bear, or Ant-eater, in zoology. See Myr-

 A_{NT} - E_{SS} , a name popularly given to a kind or little white balls found in the banks or nests of ants, ordinarily supposed to be the ova of this infect.

Late naturalists have observed that these are not properly the ants eggs, but the young brood themselves in their first state; they are so many little vermiculi wrapped up in a film, or skin, composed of a fort of filk, which they spin out of themselves as filk worms and caterpillars do. At first they are hardly observed to itir: but, after a few days continuance, they exhibit a feeble motion of flexion and extension; and begin to look yellowish and hairy, shaped like small maggots, in which shape they grow up till they are almost as large as ants. When they pass their metamorphosis, and appear in their proper shape, they have a small black speck on them close to the anus of the enclosed aut, which M. Leeuwenhoeck probably enough imagines to be the fæces voided by it. Dr Edward King opened feveral of these vulgarly reputed eggs; in some of which he found only a magget in the circumstances above described; while in another the maggot had begun to put on the shape of an ant about the head, having two little yellow specks, where the eyes were to be. In. others, a further progress was observed, the included maggots being furnished with every thing to complete the shape of an ant, but wholly transparent, the eyes only excepted, which were as black as bugles. Lattly, In others, he took out very perfect and complete ants, which immediately crept about among the rest. These supposed ants eggs are brought up every morning in fummer, near the top of the bank, where they are lodged all the warm part of the day, within reach of

hills the fun's influence. At night, or if it be cool, or like to rain, they carry them down to a greater depth; fo that you may dig a foot deep e'er you come at them. The true ants eggs are the white substance which, upon opening their banks, appears to the eye like the featterings of fine white fugar, or falt, but very foft and tender. Examined by a microscope, it is found to confift of feveral pure, white appearances, in diffinct membranes, all figured like the leffer fort of birds eggs, and as clear as a fish's bladder. The same substance is found in the bodies of the ants themselves. On this fpawn, when emitted, they lie in multitudes, to brood, till in some time it is turned into little vermicules as finall as mites, commonly called ants eggs.

> ANT-Hills, are little hillocks of earth, which the ants throw up for their habitation and the breeding of their young. They are a very great mischief to dry pastures, not only by wasting so much land as they cover, but by hindering the feythe in mowing the grafs, and yielding a poor hungry food pernicious to cattle. The manner of destroying them is to cut them into four parts from the top, and then dig into them so deep as to take out the core below, fo that, when the turf is laid down again, it may lie fomewhat lower than the level of the rest of the land: by this means it will be wetter than the rest of the land; and this will prevent the ants from returning to the same place, which otherwise they would certainly do. The earth that is taken out mult be scattered to as great a dillance every way as may be, otherwise they will collect it together and make another hill just by. The proper time for doing this is winter; and if the places be left open, the frost and rains of that time of the year will destroy the rest: but in this case care must be taken that they are covered up early enough in the spring, otherwise they will be less fertile in grass than the other places. In Hertfordshire they use a particular kind of spade for this purpose. It is very sharp, and formed at the top into the shape of a crescent, so that the whole edge makes up more than three-fourths of a circle; this cuts in every part, and does the business very quickly and effectually. Others use the same instruments that they do for mole-hills. Human dung is a better remedy than all thefe, as is proved by experiment; for it will kill great numbers of them, and drive all the rest away if only a small quantity of it be put into their hills.

> Acid of ANTS, an acid produced by distilling millions of these infects, either without addition, or with water. It resembles vinegar in many respects; but differs from it in forming cryftals with magnefia, iron, and zinc. Its attractions are not yet determined, but are supposed to coincide with those of vinegar.

ANTA, in the ancient architecture, a square pilas-

ter, placed at the corners of buildings.

ANTA, or Ante, a small kingdom on the Gold coast of Africa, extending about ten leagues in length .-The country is covered with large trees, among which stand a number of fine villages. The foil is exceedingly rich, and the face of the country beautiful. The air is also much more falubrious than in other places of the Gold coast; it being observed by all writers, that the number of deaths here bears no proportion to that on any other part on the coasts of Guinea. This country contains the following villages, which deferve a particular description on account of the commerce they drive; viz. Bourtrey, Tokorari, Sukoada, and Sama; for Antacide, which, fee those articles .- Formerly Anta was potent Antaus. and populous, inhabited by a bold and rapacious people, who greatly annoyed the Europeans by their frequent incursions; but by continual wars with their neighbours they are now greatly enfeebled, and the country in a manner depopulated. The spirit of the few remaining inhabitants is fled: they are desponding, dispirited, and abject, seeking protection from the Dutch and other Europeans who have forts on this coast, and looking upon them as their best friends.

ANTACIDS, in pharmacy, an appellation given to all medicines proper to correct acid or four humours.

Under the class of Antacids come, 1. Absorbents; as chalk, coral, fea shells, hæmatites, and steel filings. 2. Obtundents; as oils and fats. 3. Immutants; as lixivious falts and foaps.

ANTÆUS, in fabulous history, a giant of Libya, fon of Neptune and Terra. Defigning to build a temple to his father, of men's fculls, he flew all he met; but Hercules fighting him, and perceiving the affiftance he received from his mother (for by a touch of the earth he refreshed himself when weary), lifted him up from the ground, and squeezed him to death.

ANTEUS was king of Mauritania; and from feveral circumstances, with which we are supplied by various authors, it appears extremely probable that he was the same person with Atlas: they were both of them the fons of Neptune, who reigned over Mauritania, Numidia, and a great part of Libya; as may be naturally inferred from his having fuch particular marks of diffinction conferred upon him by the inhabitunts of those regions. They both ruled with absolute power over a great part of Africa, particularly Tingitania. Hercules defeated and flew Antæus in the same war wherein he took the Libyan world from Atlas: both Atlas and Antxus invaded Egypt, and contended with Hercules in the wars with the gods and were both vanquished by him. Antæus, as well as Atlas, was famed for his knowledge in the celestial sciences: from whence we may fairly conclude them to have been the fame king of Mauritania.

Antæus, in his wars with Hercules, who commanded an army of Egyptians and Ethiopians, behaved with great bravery and refolution. Receiving large reinforcements of Libyan troops, he cut off vast numbers of Hercules's men: but that celebrated commander having at last intercepted a strong body of Mauritanian or Libyan forces sent to the relief of Antæus, gave him a total overthrow, wherein both he and the best part of his forces were put to the sword. This decifive action put Hercules in possession of Libya and Mauritania, and confequently of all the riches in those kingdoms; hence arose the fable, that Hercules finding Antæus, a giant of an enormous fize, with whom he was engaged in fingle combat, to receive fresh strength as often as he touched his mother earth when thrown upon her, at last lifted him up in the air and fqueezed him to death. Hence likewise may be deduced the fable, intimating, that Hercules took Atlas's globe upon his own shoulders, overcame the dragon that guarded the orchards of the Hesperides, and made himself master of all the golden fruit. The golden apples, fo frequently mentioned by the old mythologists, were the treasures that fell into Hercules's

hands

Antagonıft Ante.

hands upon Antæns's defeat, the Greeks giving the Oriental word by riches, the fignification affixed to their own term, unda, apples. After the most diligent and impartial examination of all the different hypotheses of historians and chronologers, relating to Atlas and Antæus, we find none so little clogged with difficulties as that of Sir Isaac Newton. According to that illustrious author, Ammon, the father of Sefac, was the first king of Libya, or that valt tract extending from the borders of Egypt to the Atlantic ocean; the conquest of which country was effected by Sefac in his father's life time. Neptune afterwards excited the Libyans to a rebellion against Sesac; slew him, and then invaded Egypt under the command of Atlas or Antæus, the son of Neptune, Sesac's brother and admiral. Not long after, Hercules, the general of Thebais and Ethiopia for the gods or great men of Egypt, reduced a fecond time the whole continent of Libya, having overthrown and flain Antæus near a town in Thebais, from that event called Antæa or Antæopolis: this, we fay, is the notion advanced by Sir Ifaac Newton, who endeavours to prove, that the first reduction of Libya by Selac happened a little above a thousand years before the birth of Christ, as the last by Hercules did fome few years after.

ANTAGONIST, denotes an adverfary, especially

in speaking of combats and games.

ANTAGONIST muscles, in anatomy, those which have opposite functions; as slexors and extensors, abductors and adductors, &c.

ANTANACLASIS, in rhetoric, a figure which repeats the fame word, but in a different fense; as dum vivimus, vivamus.

ANTAGOGE, in rhetoric, a figure by which, when the accusation of the adversary is unanswerable, we load him with the fame or other crimes.

ANTANDROS (anc. geog.), a town of Mysia, on the sea coast, at the foot of Mount Alexandria, a part of Mount Ida, (Strabo, Ptolemy): it was a town of the Leleges, (Strabo); anciently called Edonis, then Cimmeris, (Pliny, Stephanus.) It takes its name from Antandros, a general of the Æolians: it is now called

ANTAPHRODISIACS, in pharmacy, medicines proper to diminish the semen, and consequently extin-

guish or lessen all desires of venery.

ANTARCTIC, in a general fense, denotes something opposite to the arctic or northern pole. Hence antarctic circle is one of the lesser circles of the spheres, and distant only 23° 30' from the fouth pole, which is likewife called autarctic for the fame reason.

* ANTARES, in altronomy, the name of a star of the first magnitude, called also the scorpion's heart. Its longitude is 60° 13' 14" of Sagittarius; and its

latitude 40° 31' 26" S.

ANTAVARE, a province of the island of Madagafear, lying about 21° 30' S. Lat. and bounded by the province and cape of Manousi. The greatest part of it is watered by the river Mananzar., whose fource is in the red mountains of Ambohitimene.

ANTE, in heraldry, denotes that the pieces are

let into one another in fuch a form as there is expres- Anteambu fed; for inflance, by dove tails, rounds, swallow tails, or the like. Antedilu-

wians.

ANTEAMBULONES, in Roman antiquity, fervants who went before persons of distinction to clear the way before them. They used this formula, Date locum domino meo, i. e. " Make room or way for my master."

ANTECEDENT, in general, fomething that goes before another, either in order of time or place.

ANTECEDENT, in grammar, the words to which a relative refers.

Antecepent, in logic, is the first of the two propositions in an enthymeme.

ANTLCEDENT, in mathematics, is the first of two terms of a ratio, or that which is compared with the other.

ANTECEDENCE, in astronomy, an apparent motion of a planet towards the west, or contrary to the order of the figns.

ANTECESSOR, one that goes before. It was an appellation given to those who excelled in any science. Justinian applied it particularly to professors of civil law; and, in the universities of France, the teachers of law take the title antereffores in all their thefes.

ANTECURSORES, in the Roman armies, a party of horse detached before, partly to get intelligence, provisions, &c. and partly to choose a proper place to encamp in. These were otherwise called antecessores, and by the Greeks prodromi.

ANTEDATE, among lawyers, a spurious or false date prior to the true date of a bond, bill, or the like. ANTEDILUVIAN, in a general fense, implies fomething that existed before the stood.

ANTIDILUVIAN World; the earth as it existed before the flood. See EARTH.

ANTEDILUVIANS, a general name for all mankind who hved before the flood, and fo includes the whole of the human race from Adam to Noah and his

As Moses has not set down the particular time of Chronoloany transaction before the flood, except only the years gy of the of the fathers age wherein the several descendants of are ages. Adam in the line of Seth were begotten, and the length of their feveral lives; it has been the bufinefs of chronologers to endeavour to fix the years of the lives and deaths of those patriarchs, and the distance of time from the creation to the deluge. In this there could be little difficulty were there no varieties in the feveral copies we now have of Mofes's writings; which are, the Hebrew, the Samaritan, and the Greek verfions of the Septuagint; but as these differ very considerably from one another, learned men are much divided in their opinions concerning the chronology of the first ages of the world; some preferring one copy, and fome another.

That the reader may the better judge of the variations in the three copies in this period, they are exhibited in the following table, with the addition of those of Josephus as corrected by Dr Wells and Mr Whifton.

A TABLE

1.

A TABLE of the Years of the Antediluvian Patriarchs.

Jared, Methuse- lah, and La- mech, die,	1307		The	Flood	•	847		720	653	600

To the varieties exhibited in the two last tables, others might be added, by admitting the various readings of some numbers in the Samaritan and Septuagint: for as to the Hebrew copies, there is here a constant agreement among them.

The manuscript from which the Samaritan Pentateuch was published, agrees exactly with the Samaritan numbers given by Eusebius. But St Jerome tells us, that, in his time, there were some Samaritan copies which make Methuselah 187 years old at the birth of Lamech, and Lamech 182 at the birth of Noah, just as the Hebrew does. Now if these numbers be approved as the true original numbers, the interval from the creation to the flood will be 1556 years; differing

aradife.

Antellar from the Hebrew computation but 100 years in the age of Jared at the birth of Enoch; and if this last be allowed to be a mistake of the transcriber, by his dropping a number, and writing 62 instead of 162, as has been suspected, the Samaritan will be perfectly reconciled with the Hebrew, and all difference between them

> Scaliger, on the authority of an old Samaritan chronicle, having at the end a table of the years of the patriarchs to the time of Moses, would correct two of the Samaritan numbers in Eusebius; viz. instead of 65. the age of Mahalaleel when he begat Jared, he thinks it should be 75; and instead of 67, the age of Methufelah when he begat Lamech, he would have it 77. By which alterations he reckons 20 years more to the flood than Eusebius and the manuscript; that is, 1927. But as he acknowledges the table, whereon he grounds these corrections, contains some great absurdities, it feems unreasonable to oppose it to the joint authority of Eusebius and the Samaritan manuscript.

> As to the Septuagint, in the common editions of that version, the age of Methuselah at the birth of Lamech is 167; and confequently the fum of this period, according to them, is no more than 2242. But in this case Methuselah will outlive the flood 14 years; and we may well wonder, with Eufebius, where he was preferred. To obviate this objection, we are told, that, in some copies, Methuselah is said to have lived but 782 (not 802) years after the birth of Lamech, and no more than 949 in all. But the Alexandrian manufcript entirely takes away the difficulty, by giving the same number in this place with the Hebrew.

Pezron is of opinion, that the age of Lamech at the . birth of Noah should be but 182, as it is both in the Hebrew and in Josephus, supposing, with St Austin, that the present number is the error of the scribe who first copied the original Septuagint manuscript in Ptolemy's library. So that he computes 2256 years to the flood. And, if this correction be admitted, and one more mentioned also by St Austin, viz. that Lamech, lived 505 years after the birth of Noah, and not 565, as in the present copies, there will then remain no other difference between the Septuagint and the Hebrew than 600 years added to the ages of the fix patriarchs when they begat their fons, and Methuselah will, conformably to the Hebrew and Samaritan, die in the year of the flood.

Having premifed this chronological view, we shall proceed to the history of the antediluvian patriarchs.

Of the great progenitor we are told, that " the)f Adam in Lord God took the man and put him into the garden." These words plainly indicate, that Adam was not created within the precincts of Paradife; and it is afterwards faid, upon his being turned out of the garden, " He was fent to till the ground whence he was taken."-As to the fituation of this garden, concerning which there has been fo much learned but uncertain inquiry, fee the article PARADISF.

Adam was doubtless created in the prime of his life, with all his powers and faculties in the highest degree of strength and vigour. His body would be graceful, and well proportioned; while his countenance was comely, and glowed with all the luftre of youthful innocence. The poet thus describes our first parents:

Adam the goodliest man, of men since born His fons; the fairest of her daughters Eve. for in their looks divine

The image of their glorious Maker shone. Milton.

Many have entertained an opinion (as mentioned under the article ADAM), that our first parent was created an adept in knowledge and in science, a confummate philosopher, and an accomplished divine. But the very reverse of this must be true, providing we give credit to the account which Mofes gives of him. If Adam was created with intuitive knowledge, for what end was he endowed with the fenfes of a man. through which ideas might be conveyed to his mind, and make him capable of fuch improvements as arise from experience and observation? And if he originally posfeffed fuch a fund of valuable knowledge, why had he fuch an ardent thirst for an unwarrantable portion of more, and for the fake of this additional pittance forfeited his happiness and lifé? Besides, if Adam was at first all light and knowledge, and was soon after reduced to a flate of ignorance and error, this transition would make a retrograde in the fystem of nature, quite diffimilar to that uniformity which obtains throughout the whole of the divine government and economy. Mofes introduces our first parents into life in the most natural manner, as having capacities to acquire knowledge, fenfes to receive impressions from objects around them, and a fufficient degree of reason to form a judgment of the things perceived: yet all these faculties can only be confidered as fo many instruments, by the exercise of which they might be enabled to discharge the duties of their future life.

The following portrait of our first progenitor when Smellie's he first came into life, drawn by the inimitable pencil Translation, of Buffon, is extremely beautiful, while it is diffonant Vol. III. p. of Buffon, is extremely beautiful, while it is dinomant 50, &c. from no part of the Mosaic history. "Let us suppose (the passage a man in the fame fituation with him who first received here a existence; a man whose organs were perfectly formed, bridged). but who was equally new to himself, and to every object which surrounded him. Were he to give a hiflory of his thoughts, and of the manner in which he received impressions, he might give some such information as this. I remember the moment when my existence commenced. It was a moment replete with joy, with amazement and anxiety. I neither knew what I was, where I was, nor whence I came. I opened my eyes. But what an amazing increase of sensation! The light, the celetial vault, the verdure of the earth, the transparency of the waters, gave animation to my fpirits, and conveyed pleasures which exceed the powers of expression. At first I believed that all these objects existed within me, and formed a part of myfelf. When, turning mine eyes to the fun, his fplendour overpowered me. I voluntarily shut out the light, and felt a small degree of pain. During this moment of darkness, I imagined that I had lost the greatest part of my being. I was then roused with a variety of founds. The finging of birds and the murmuring breezes formed a concert, which excited the most sweet and enchanting emotions. I listened, and was convinced that these harmonious sounds existed within me. - I made a step forwards; and afterwards renewing my motion, I walked with my face turned

towards

Apredilu- towards the heavens; till I struck against a palm tree, and felt some degree of pain. Seized with terror, I ventured to lay my hand upon the object, and perceived it to be a being distinct from myself, because it did not, like touching my own body, give me a double fensation. I resolved then to feel every object I saw, and had a strong desire to touch the fun; but stretching out my hands to embrace the heavens, they met without any intermediate object. All objects appeared to me equally near; and it was not till after many trials that I learned to use my eye as a guide to my hand. At last the train of my ideas was interrupted, and I lost the consciousness of my existence. My sleep was profound; but having no mode of measuring time, I knew nothing of its duration. When I awakened, I was aftonished to find by my side another form, perfeetly fimilar to my own. I conceived it to be another felf; and instead of losing by my sleep, I imagined myfelf to be doubled. I ventured to lay my hand upon this new being. With rapture and aftonishment I perceived that it was not myfelf, but fomething much more glorious and defirable."

This philosophical detail coincides with the opinion, that, excepting what portions of knowledge Adam might acquire by the exercise of his senses, his Maker taught him every thing that was necessary for his comfort and subsistence. But before the Almighty gave any inflr thions to our first parents, we must suppose he inspired them with the knowledge of the meaning of every word which they heard him speak; otherwife it would have been impossible that he could have had any fuch communication with them. The words which they heard and were made to understand, being imprinted upon their memories, would ferve as the foundation of a language, which they would afterwards increase and enlarge as new objects began to multiply, and hence give rife to new terms and defini-

One of the first lessons taught to Adam by his infallible Director, would be the necessity of food for the support of his life. Accordingly Moses informs us, that for this purpose a grant was made him to eat of every tree of the garden, excepting one. At the same time it was made known to him, in what manner he was to repair the decays of nature, namely, by eating of the tree of life. Then, in order to qualify him for focial intercourse, he was ordered to exercise his faeulty of speech, by giving names to different creatures. The author of the book of Ecclefiasticus says of our first parents, " They received the use of the five operations of the Lord; and in the fixth, he imparted to them understanding; and in the seventh, speech to interpret the cogitations thereof." The meaning cannot be, that he gave them every word they were to pronounce, more than every idea which their fenfes were to convey to their understanding. Our talents, and the exercise of them, may be both said to be given us of God; but whatever capacities we receive from him, it is supposed that we ourselves must improve them, before we can attain to any acquirements whatever. Although Adam had heard and understood the words of God, yet Moses does not give the least hint that he ever attempted to speak before this time. For if he had, as some imagine, innate knowledge and proper terms for every thing prefented to him, what

occasion was there to bring animals before him to fee Antediluwhat names he would impose upon them? Some writers have endeavoured to turn it into ridicule the whole of this transaction, and have asked, how could all creatures upon earth appear at one time before Adam? not only one, but many days would have elapfed before he could give each a name. But this objection arises from not understanding the words of Moses. What our translators render, to see what he would call THEM, is in the original, to fee what name he would call ir. "And whatfoever Adam called ir (viz. the living creature), that was the name of it." The meaning feems to be no more than this: God brought a few creatures to Adam, to make him try to name them; and whatever he called any of them, that continued to be its name. And no doubt he would denominate every animal before him, from its external appearance, from its fize, its colour, or its voice: And in process of time, he would give names to all those creatures which Providence brought within his view, or with which he became afterwards acquainted.

The next thing in which God instructed Adam, though probably in a trance or vision, was his near relation to Eve, as being part of his own body. This piece of knowledge was imparted to him, in order to cement the greater love and affection between the two during the remaining period of their lives.

These, according to Moses, are all the transactions in which our first parents were interested during their abode in Paradife, till they loft their innocence, and forfeited the enjoyments of their happy fituation. And nothing can be more evident, than that the instructions which they received, bespoke the infantile state of their minds; though there is no doubt but further and higher dispensations of knowledge would have been communicated to them, as they became able. to bear them, and had their minds matured by experience and reflection.

How long our first parents retained their innocence, How long we are nowhere told. Many affert that they fell on our first pathe very first day of their creation. But Moses men-rents retions fo many transactions on that day, as must have tained their ingroffed the whole of their attention, and prevented innocence. them from falling into such temptations as arise from indolence and want of reflection. Besides, if, in such circumstances as they were placed, they could not refrain from an open violation of the Divine law for the space of one day, it would bespeak a deceitfulness of heart in them greater than in most of their posterity. It is somewhat singular, that many of the great trials recorded in facred writing were limited to 40 days; which in prophetic style is sometimes equivalent to 40 years. This appears from the history of Moses, of Elijah, of Nineveh, and of the Jewish nation after the death of Christ. And, what is very remarkable, he, of whom Adam was a type, was tempted 40 days in the wilderness. Agreeable to this part of the Divine economy, perhaps the trial of our first parents lasted fo long. However, that they remained for a confiderable time in the garden, appears highly probable from this confideration, that their indulgent Creator, who had manifelled his tender concern for them while innocent, and extended his mercy to them when fallen, would never have turned them out of paradife, and

Antedilu- fent them into an uncultivated world, before they had acquired the arts of living, and were capable of proviing against the vicissitudes of their future lot. particulars of this memorable transaction are considered under the article FALL.

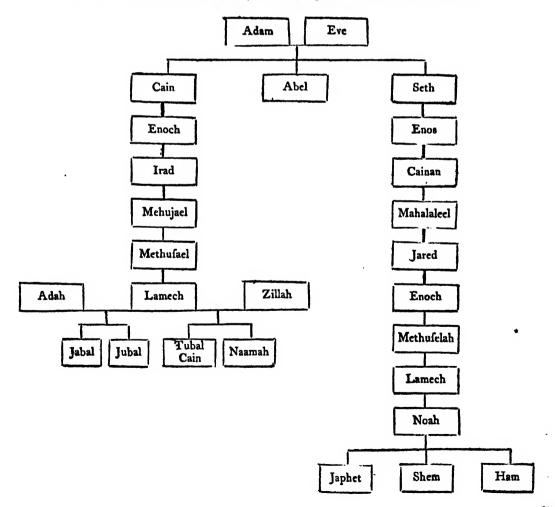

Moses gives us no further account of Adam's life after leaving the garden, but that he begat some children, and died at such an age. Yet we have no reason to doubt, but the venerable patriarch ever after led a life of penitence, and of the strictest piety. The various communications which he had enjoyed with his Maker in paradife, and which were probably renewed to him after his fall, could not fail to make the deepest impressions upon his mind. The gracious respite he had met with, from the execution of the sentence denounced against him, would make him cautious of offending for the time to come; lest the next violation of the Divine authority should put an end to his existence. The cherubim and flaming fword, or the devouring flame, on the east of Eden (which might continue burning all his life), would be to him what the vestiges of the ark were to Noah and his fons, an awful memorial of the danger of incurring the Divine displeafure. Besides, his worldly comforts being in a great measure withdrawn, his mind would be naturally disposed for relishing those pleasures which flow from piety Anteditoand religion.

The first thing which we hear of Adam in his new fituation was, that he knew Eve his wife, and fbe con of their ceived and bare Cain. Afterwards, we are told, the progent. bare Abel. When the brothers were grown up, they betook themselves to distinct employments; the former to husbandry, and the latter to the keeping of sheep. Their inward dispositions were still more different; Cain being wicked and avaricious, but Abel just and virtuous.

In process of time they brought their respective offerings to God; Cain of the fruit of the ground, and Abel of the firstlings of his flock: but they met with very different success; for God accepted the offering of Abel, but Cain's he did not accept; the confequences of which are related under the articles ABBL and CAIN.

Soon after the murder of Abel, his lofs was made up to his parents in another fon they had, whom Eve named Setb, that is, "appointed;" because he was appointed inftead of Abel whom Cain flew.

As the whole progeny of Adam, of whom we have any mention in Scripture, were the descendants of Cain and Seth, it may be proper to give the following genealogical table of the Antediluvians.

Antediluvians.

)f the line ? Cain.

The facred historian, confining himself chiefly to the line of Seth, from whence Noah was descended, has acquainted us with very few particulars relating to that of Cain: nor can we thus form any conjectures how long he or any of his descendants lived. All we know is, that Lamech, the fifth in descent from him, married two wives, Adah and Zillah, the first known instance of polygamy: that by the former he had two fons, Jabal, who was the first that dwelt in tents, and fed cattle; and Jubal, the inventor of music; and by the other, a fon named Tubal-Cain, who found out the art of forging and working metals. Zillah likewise brought him a daughter named Naamah, supposed to have invented spinning and weaving: and we are told that, on some occasion or other, Lamech made a speech to his wives, the explication of which has greatly puzzled the interpreters. See LAMECH.

I've line of

Moses proceeds to tells us, that Seth had a son born to him called Enos, and that then began men to call upon Miln's Phy- the name of the Lord. Commentators give us three les-Theolog. the name of the lewords. Some think the words 1 242, &c. should be rendered, Then men prophaned in calling on the name of the Lord; and that even Enos arrogated to himself a power, as if he had been a god. But this fense feems harsh and unnatural. There is nothing more unlikely, than that Adam's grandchildren, who lived under his own eye, would fo foon shake off parental authority, and apostatize from the belief and worship of the one true God. Others think, that though men had hitherto worshipped God in private, yet they now inflituted public affemblies, met in larger focieties for folemn and focial worship, and introduced liturgies and forms for more effectually paying their homage to the Almighty. This indeed is a very natural comment from those who place religion in modes and set forms of worship. But it is scarcely credible, that Adam and his family had never met together to worship God till now, when we are told that Cain and Abel, and probably both their families along with them, brought their offerings to the Lord; this they no doubt did every Sabbath day. Others, therefore, put a more confiftent interpretation upon the words, namely, that men now called themselves by the name of the Lord. The meaning of which is, that about this period, the family of Seth, who adhered to God and his worship, began to give themselves a denomination, expressive of their relation and regards to him. They diftinguished themselves from the irreligious family of Cain, and assumed the title of the fons or children of God: which delignation was afterwards applied to them by Moses: it was even used after the flood, and adopted by the writers of the New Testament.

Of the three next descendants of Seth, Cainan, Mahalaleel, and Jared, and of Methuselah and Lamech, the grandfather and father of Noah, Mofes has recorded no more than their several ages. The oriental authors commend them, as they do Seth and Enos, for their piety, and the falutary injunctions they left behind them, forbidding their children all intercourfe with the race of curfed Cain.

Enoch the fon of Jared, and father of Methuselah, was a person of most extraordinary piety, walking with God, as the Scripture expresses it, for at least the last three hundred years of his life; as a reward for Vol. II. Part I.

which exemplary behaviour in fo corrupt an age, he Antedilawas taken up by God into heaven, without talling vians. death. See Enoch.

Moles afterwards informs us, When men began to Corruption multiply, i. e. when the earth was filled with inhabi-of the hutants, and tribes formerly living remote began to ap-man race. proach nearer to one another, Daughters were born unto them; meaning in greater abundance than formerly; which feems to hint, that at this period there were confiderably more females than males born into the world. Some think that Mofes, being now about to mention the wickedness of the Antediluvians, introduces the posterity of Cain as being the chief cause of their corruption; and that he styles them men and daughters of men, because they were sensual and earthly; in which fenfe the word men is fometimes used in the Scriptures.

The fons of God faw the daughters of men that they were fair; and they took them wives of all that they chofe. These words have given rise to many absurd and ridiculous comments both of Jews and Christians. There are two meanings affixed to them, which may be mentioned as the most probable. Whenever the name of God is added to any thing, it not only denotes God's being the efficient cause, but it beightens and increases its usual meaning. For which reason any thing that is excellent in its kind, or uncommonly lofty and magnificent, was by the Jews faid to be of God, or of the Lord. Thus the angels are called the fons of God. And Adam being created with a nobler image than any other creature, is faid to be made in the image of God. The cedars of Lebanon are called the cedars of the Lord; and great mountains, the mountains of God. Therefore by the fons of God in this place are meant men of great opulence, power, and authority. And by way of contrast, the hillorian introduces those of poor and mean circumstances in life, and calls them the daughters of men. The words thus explained, are not an unlikely description of that dissolute age. The great and mighty in this world are commonly most addicted to sensual gratilications, because they have so many incentives to instame their passions, and so few restraints to curb them; and, inflead of using their power to punish and discountenance vice, are too often the greatest examples and promoters of lasciviousness and debauchery. Thus, these fons of God, these great men, when they happened to meet with the daughters of their inferiors, gazed upon them as fit objects to gratify their luit; and from among these they took to themselves, in a forcible manner, wives, or (as it may be rendered) concubines, of all that they chose, whether married or unmarried, without ever asking their consent. No wonder, then, that the carth should be filled with violence, when the highest rank of men were above the reftraint of law, of reason, and religion, and not only oppressed the poor, but with impunity treated them and their children in fuch a base and cruel manner.

But there are other writers who cannot relish the above opinion; because they think it a harsh and unnatural confiruction, to call great and powerful persons the four of God, and all mean and plebeian women the daughters of men. Besides, the text does not say, that the fons of God offered any violence to these inferior

Mila, p.

265.

Antedilu- women; but that they saw that they were fair, and made choice of them for wives. And wherein is the heinousness of the offence, if men of a superior rank marry their inferiors, especially when an excess of beauty apologizes for their choice? Or why should a few unequal matches be reckoned among the causes of bringing upon the world an universal destruction? For these reasons many are of opinion, that the descendants of Seth, who were flyled the fons of God on account of. their near relation to him, faw the daughters of men, i. e. the impious progeny of Cain, and by intermarriages became affociated with them; and furrendering to those enchantresses their hearts and their freedom, they surrendered at the same time their virtue and their religion. From this union proceeded effects fimilar to what has happened ever fince. When a pure fociety mixes with a profane, the better principles of the one become foon tainted by the evil practices of the other; which verifies the old adage. Evil communication corrupts good manners. Thus it appears, that the great fource of univerfal degeneracy was owing to the posterity of Seth mingling with the progeny of Cain, in opposition to what their pious fathers had strictly charged them.

> It is afterwards said, There were giants in the earth in those days: and also after that, when the sons of God came in unto the daughters of men, and they bare children to them, the same became mighty men, which were of old men of renozun. Translators are not agreed about the meaning of the word giants. Some render the word, violent and cruel men; others, men who fall upon and rulb forward, as a robber does upon his prey: the meaning then is, that they were not more remarkable for their strength and stature, than for their violence and crucky. It is generally agreed, that in the first ages of the world, men were of a gigantic stature; though Moses does not mention them as giants till after the union of the families of Seth and Cain, when men used their superiority in bodily strength for the purposes of gratifying their unhallowed passions.

> At this period of the world, and long after, political power and bodily flrength went hand in hand together. Whoever was able to encounter and kill a fierce and dangerous wild heaft, and clear the country of noxious animals, or who was able in the day of battle to deflroy most of his enemies, was looked up to by the reft of his companions as the fittelt to be their leader and commander. Thus Nimrod, from being a mighty hunter, became a great king, and, grasping at power, was never fatisfied till every obstacle to his-ambition was removed. And it appears from history, that all his fuccessors have pretty nearly trodden in the same path. These giants then, or fons of God, might be the chief warriors, who formed themselves into chosen bands, and living among a cowardly and effeminate people, had no curb to their cruelty and luft. From them might fpring an illegitimate race, refembling their fathers in body and mind, who, when they grew up, having no inheritance, would be turned loofe upon the world, and follow no other employment but theft, rapine, and plunder. Thus they became mighty men and men of renower, and procured themselves a name: but this was owing to the mischief they did, and the feats of favage cruelty which they performed.

> Mankind running thus headlong into all manner of vice, were admonshed to repent; and God, out of his

great mercy, was pleafed to grant them a convenient Antedilutime for that purpose; no less than 120 years, during which space, but no longer, he declared his Spirit should "ftrive with man," or endeavour to awaken and reclaim them from their wicked course of life.

/ Amidst this general corruption, one man, however, was found to be just and perfect in his generation, walking with God. This extraordinary person was Noah, the fon of Lamech; who, not thinking it fufficient to be righteous himfelf, unless he did his utmost to turn others likewife to righteousness by admonition as well as example, became a preacher to the abandon-Preaching ed race among which he lived, employing both his of Noah. counsel and authority to bring them to a reformation of their manners, and to restore the true religion among them. But all he could do was to no purpose; for they continued incorrigibly oblinate; fo that at length (as Josephus tells us), finding himself and family in imminent danger of fome violence in return for his good will, he departed from among them, with his wife and children.

On his departure, it is probable they fell into great-Mankind er disorders than before; having now none to controul, incorrigible. or even to trouble them with unwelcome advice. Mofes affures us, " that the wickedness of man was great in the earth, and that every imagination of the thoughts of his heart was continually evil;" and that " the earth was corrupt and filled with violence, all thefh having corrupted his way upon the earth." These words leave no room to inquire into the particular crimes of the Antediluvian world, which feems to have been overrun with a complication of all manner of debauchery and wickedness, and above all with violence and injuflice towards one another.

Things being in this state, God, as the facred histo. The whole rian pathetically expresses it, "repented that he had world demade man on earth, and it grieved him at his heart., froyed by And the time of forbearance being elapsed, he passed copt Nosh the fentence of their utter destruction by a flood of wa- and his faters; a fentence which likewise included the beasts of mily. the_earth, and every creeping thing, and the fowls of the air. But " Noah found grace in the eyes of the Lord;" who had before acquainted him with his defign of bringing a deluge on the earth, and directed him to make an ark, or vessel, of a certain form and fize, capable of containing not only himself and family, but fuch numbers of animals of all forts as would be fufficient to preferve the feveral species, and again replenish the earth, together with all necessary provisions for them. All these injunctions Noah performed; and, by God's peculiar favour and providence, he and those that were with him furvived this tremendous calamity.

As to any further transactions before the flood, we Traditional are left entirely in the dark by the facred historian, history of The Jews and eastern nations, however, have made the Anteample mends for the filence of Moses, by the abun-diluviane. dance of their traditions. The only part of thefe, which can be connected in any thing like history, is -After the death of Adam, Seth, what follows .with his family, separated themselves from the profligate race of Cain, and chose for their habitation the mountain where Adam was buried, the Cainites remaining below, in the plain where Abel was killed; and, according to our historians, this mountain was fo high,

See the article DELUGE.

God's forbearance.

Antedilu- that the inhabitants could hear the angels finging the praises of God, and even join them in that service. Here they lived in great purity and fanctity of man-Their constant employment was praising God, from which they had few or no avocations; for their only food was the fruit of the trees which grew on the mountain, fo that they had no occasion to undergo any fervile labours, nor the trouble of fowing and gathering in their harvest, They were utter strangers to en-Their only oath was, " By vy, injustice, or deceit. the blood of Abel;" and they every day went up to the top of the mountain to worship God, and to visit the body of Adam, as a mean of procuring the Divine bleffing. Here, by contemplation of the heavenly bodies, they laid the foundations of the science of astronomy; and, lest their inventions should be forgotten, or loft before they were publicly known, understanding, from a prediction of Adam's, that there would be a general destruction of all things, once by fire, and once by water, they built two pillars, one of brick, and the other of stone, that if the brick one happened to be overthrown by the flood or otherwise destroyed, that of stone might remain. This last, Josephus says, was to be feen in his time in the land of Syriad, (thought to be in Upper Egypt).

The descendants of Seth continued in the practice of virtue till the 40th year of Jared, when an hundred of them hearing the noise of the music and the riotous mirth of the Cainites, agreed to go down to them from the holy mountain. On their arrival in the plain, they were immediately captivated by the beauty of the women: who were naked, and with whom they defiled themselves; and this is what is meant by the intermarriage of the fons of God with the daughters of men, mentioned by Moles. The example of these apostate fons of Seth was foon followed by others; and from time to time great numbers continued to descend from the mountain, who in like manner took wives from the abandoned race of Cain. From these marriages sprung the giants (who, however, according to Moses, existed before); and these being as remarkable for their impiety as for their strength of body, tyrannized in a cruel manner, and polluted the earth with wickedness of every kind. This defection became at last so universal, that none were left in the holy mountain, except Noah, his wife, his three sons and their wives.

Profue hibylonian Antiquities.

Berofus, a Chaldeau historian, who flourished in the Be-time of Alexander the Great, enumerates ten kings who reigned in Chaldea before the flood; of whom the first, called Alorus, is supposed to be Adam, and Xifuthrus, the last, to be Noah.—This Alorus declared that he held his kingdom by divine right, and that God himself had appointed him to be the pastor of the people. According to our historian, in the first year of the world, there appeared out of the Red sea, at a place near the confines of Babylonia, a certain irrational animal called Oannes. He had his whole body like that of a fish; but beneath his fish's head grew another of a different fort (probably a human one). He had also feet like a man, which proceeded from his fish's tail, and a human voice, the picture of him being preserved ever after. This animal conversed with mankind in the day-time, without eating any thing : he delivered to them the knowledge of letters, sciences, and various arts: he taught them to dwell together in Antedincities, to erect temples, to introduce laws, and instructed them in geometry: he likewife showed them how to gather feeds and fruits, and imparted to them whatever was necessary and convenient for a civilized life; But after this time there was nothing excellent invented. When the fun set, Oannes retired into the sea, and continued there all night. He not only delivered his instructions by word of mouth, but, as our author affures us, wrote of the origin of things, and of political economy. This, or a similar animal, is also mentioned by other authors.

Of Alasporus, the second king, nothing remarkable is related. His successor, Amelon, or Amillarus, was of a city called Pantabibla. In his time another animal refembling the former appeared, 260 years after the beginning of this monarchy. Amelon was succeeded by Metalarus; and he by Daonus, all of whom were of the same city. In the time of the latter, four animals of a double form, half man and half fish, made their appearance. Their names were Euedocus, Eneugamus, Encubulus, and Anementas. Under the next prince, who was likewise of Pantabibla, appeared another animal of the same kind, whose name was Oducon. All these explained more particularly what had been

concifely delivered by Oannes.

In the reign of the tenth king, Xifuthrus, happened the great deluge, of which our author gives the following account: Cronus, or Saturn, appeared to Xiluthrus in a dream, and warned him, that on the fifteenth of the month Dæsius mankind would be destroyed by a flood; and therefore commanded him to write down the original, intermediate state, and end of all things, and bury the writings under ground in Sippara, the city of the fun; that he thould also build a ship, and go into it with his relations and dearest friends, having first furnished it with provisions, and taken into it fowls and four footed beafts; and that, when he had provided every thing, and was asked whither he was failing, he should answer, To the gods, to pray for happiness to mankind. Xifuthrus did not difobey; but built a veffel, whose length was five furlongs, and breadth two furlongs. He put on board all he was directed; and went into it with his wife, children, and friends. The flood being come, and foon ceafing, Xifuthrus let out certain birds, which finding no food, nor place to reft upon, returned again to the ship. Xisuthrus, after some days, let out the birds again; but they returned to the ship, having their feet daubed with mud: but when they were let go the third time, they came no more to the ship, whereby Xisuthrus understood that the earth appeared again; and thereupon he made an opening between the planks of the thip, and feeing that it rested on a certain mountain, he came out with his wife, and his daughter, and his pilot: and having worshipped the earth, and raised an altar, and sacrificed to the gods, he and those who went out with him disappeared. They who were left behind in the ship, finding that Xifuthrus and the persons that accompanied him did not return, went out themselves to seek for him, calling him aloud by his name; but Xısuthrus was no more feen by them: only a voice came out of the air which enjoined them, as their duty was, to be religious; and informed them, that on account of his own piety he was gone to dwell with the gods, and

Amedila- that his wife and daughter and pilot were partakers of the same honour. It also directed them to return to Babylon, and that, as the fates had ordained, they should take the writings from Sippara, and communicate them to mankind; and told them, that the place where they were was the country of Armenia. When they had heard this, they offered facrifice to the gods, and unanimously went to Babylon; and when they came thither, they dug up the writings at Sippara, built many cities, raised temples, and rebuilt Babylon.

ntediluan kings Egypt.

The Egyptians, who would give place to no nation, in point of antiquity, have also a series of kings, who, as is pretended, reigned in Egypt before the flood; and, to be even with the Chaldeans, began their account the very fame year that theirs does according to Berofus.

There was an ancient chronicle extant among the Egyptians, not many centuries ago, which contained go dynasties of princes who ruled in that country, by a feries of 113 generations, through an immense space of 36,525 years, during which Egypt was fuccessively governed by three different races; of whom the first were the Auritæ, the fecond the Mestræi, and the third the Egyptians.

But this extravagant number of years Manetho (to whose remains we must chiefly have recourse for the ancient Egyptian history) has not adopted, however in other respects he is supposed to have been led into errors in chronology by this old chronicle, which yet feems to have been a composition since Manetho's

lanchonia-

iician

uftory.

The account given by Berofus is manifestly taken ho's Phœfrom the writings of Moses; but we have another account of the first ages of mankind, in which no mention is made of the flood at all. This is contained in fome fragments of a Phonician author called Sanchoniatho, who is by some said to have been contemporary with Gideon, by others to have lived in the days of King David; while fome boldly affert there never was fuch a person, and that the whole is a fiction of Philo-Biblius in opposition to the books of Josephus, written against Apion. To gratify the reader's curiosity, however, we have subjoined an account of the first ten generations mentioned by him, which are supposed by the compilers of the Universal History to correspond to the generations mentioned by Mofes before the

Sanchoniatho having delivered his cosmogony, or generation of the other parts of the world, begins his history of mankind with the production of the first pair of mortals, whom Philo, his translator, calls Protogonus and Æon; the latter of whom found out the food which was gathered from trees.

Their iffue were called Genus and Genea, and dwelt in Phoenicia: but when the great droughts came, they Aretched forth their hands to heaven towards the fun; for him they thought the only God and Lord of heaven, calling him Beelfamen, which in Phoenician is Lord of beaven, and in Greek Zeus.

Afterwards from Genus, the fon of Protogonus and Mon, other mortal issue was begotten, whose names were Phos, Pur, and Phlox; that is, Light, Fire, and Flame. These found out the way of generating fire, by the subbing of pieces of wood against each other, and taught men the use thereof. They begat sons of vast bulk and height, whose names were given to the

mountains on which they feized: fo from them were Antedilunamed Mount Cassius, Libanus, Antilibanus, and Bra- viana.

Of these last were begotten Memrumus and Hypsuranius; but they were so named by their mothers, the women of those times, who without shame lay with any man they could light upon. Hypsuranius inhabited Tyre, and he invented the making of huts of reeds and rushes and the papyrus. He also fell into enmity with his brother Usous, who first invented a covering for his body out of the skins of the wild beasts which he could catch. And when violent tempests of winds and rains came, the boughs in Tyre, being rubbed against each other, took fire, and burnt the wood there. And Usous, having taken a tree, and broke off its boughs, was so bold as to venture upon it into the sea. He also consecrated two rude stones, or pillars, to fire and wind; and he worshipped them, and poured out to them the blood of fuch wild beafts as had been caught in hunting. But when these were dead, those that remained confecrated to them flumps of wood and pillars, worthipping them, and kept anniversary featls un-

Many years after this generation came Agreus and Halicus, the inventors of the arts of hunting and fishing, from whom huntimen and fishermen are named.

Of these were begotten two brothers, the inventors of iron and of the forging thereof : one of thefe, called Chryfor, the same with Hephcitus, or Vulcan, exercifed himself in words and charms and divinations; found out the hook, bait, and fishing line, and boats slightly built; and was the first of all men that sailed. Wherefore he also was worshipped after his death for a god: and they called him Zeus Michius, or Jupiter the engineer; and fome say his brothers invented the way of making walls of brick.

Afterwards from this generation came two brothers; one of whom was called Technites, or the Artist; the other Geinus Autochthon, [the home-born man of the earth.] These found out to mingle stubble, or small twigs, with the brick earth, and to dry them in the

fun, and fo made tyling.

By these were begotten others; of which one was called Agrus [Field]; and the other Agrouerus, or Agrotes [Husbandmen], who had a statue much worshipped, and a temple carried about by one or more yoke of oxen, in Phænicia, and among those of Byblus he is eminently called the greatest of the gods. These found out how to make courts about men's houses, and fences and caves, or cellars. Husbandmen, and such as use dogs in hunting, derive from these; and they are also called Alete and Titans.

Of these were begotten Amynus and Magus, who showed men to constitute villages and slocks.

In these men's age there was one Eliun, which imports in Greek Hypfiftus [the most high], and his wife was named Beruth, who dwelt about Byblus: and by him was begot one Epigerus, or Autochthon, whom they afterwards called Uranus [heaven]; fo that from him that element which is over us, by reason of its excellent beauty, is called heaven: and he had fifter of the same parents called Ge [the earth]; and by reason of her beauty the earth had her name given to it.

Hypfiftus, the father of thefe, dying in fight with wild beafts, was confecrated, and his children offered facrifices and libations to him.—But Uranus taking the

Antedilu- kingdom of his father, married his fifter Ge, and had by her four fons; Ilus, who is called Cronus, [or Saturn]; Betylus; Dagon, who is Siton, or the god of corn; and Atlas: but by other wives Uranus had much issue.

> As to the customs, policy, and other general circumstances of the Antediluvians, we can only form conjectures.

> The only thing we know as to their religious rites is, that they offered facrifices, and that very early, both of the fruits of the earth and of animals ; but whether the blood and flesh of the animals, or only their milk and wool, were offered, is a disputed point.-

Arts, &c. of luvians.

Of their arts and sciences, we have not much more the Antedi-to fay. The Antediluvians feem to have spent their time rather in luxury and wantonness, to which the abundant fertility of the first earth invited them, than in discoveries or improvements, which probably they flood much less in need of than their successors. art of working metals was found out by the last generation of Cain's line; and music which they might be supposed to practise for their pleasure, was not brought to any perfection, if invented; before the same generation. Some authors have supposed astronomy to have been cultivated by the Antediluvians, though this is probably owing to a millake of Josephus: but it is to he prefumed, the progress they made therein, or in any other science, was not extraordinary; it being even very doubtful whether letters were so much as known before the flood. See ALPHABET, No 13.

As to their politics and civil constitutions, we have not so much as any circumstances whereon to build conjecture. It is probable, the patriarchal form of government, which certainly was the first, was fet afide when tyranny and oppression began to take place, and much sooner among the race of Cain than that of Seth. It feems also, that their communities were but few, and confisted of vastly larger numbers of people than any formed fince the flood: or rather, it is a question, whether, after the union of the two great families of Seth and Cain, there were any distinction of civil focieties, or diversity of regular governments, at all. It is more likely, that all mankind then made but one great nation, though living in a kind of anarchy, divided into feveral disorderly affociations; which, as it was almost the natural consequence of their having, in all probability, but one common language, so it was a circumstance which greatly contributed to that general corruption which otherwise perhaps could not have so universally overspread the Antediluvian world. And for this reafon chiefly, as it seems, so soon as the posterity of Noah were sufficiently increased, a plurality of tongues was miraculously introduced, in order to divide them into distinct societies, and thereby prevent any such total depravation for the future. See Confusion of Tongues.

Of the condition of the Antediluvians, Mr Whitehurst, in his Inquiry into the original state and formation of the P. 282, earth*, has given us the following picture: " Under a 283. mild and ferenc ky, and when the spontaneous productions of the earth were more than sufficient for the calls of nature, without art or labour, mankind had no need of any other protection from the inclemency of the featons, nor of barns for winter's store, than the benevolent Author of nature had plentifully provided for them. Consequently, in a state of nature like this, there was no temptation to acts of violence, in-

justice, fraud, &c. every one having plenty and enough Amediliaeach equally partook of the numerous bleffings thus vians. amply provided for him. Power and property being equally diffused, men lived together in perfect peace and harmony, without law, and without fear; therefore it may be truly faid of the Antediluvians, that they slept away their time in fweet repose on the eververdant turf. Such apparently was the state of nature in the first ages of the world, or from the creation to the first convulsion in nature, whereby the world was not only universally deluged, but reduced to a heap of ruins." But our ingenious author, whose Inquiry is not professedly repugnant to revelation, seems here to have loft himself in a pleasing reverie. At least he has forgot to inform us, For what purpose, under such circumstances, he supposes the deluge to have been sent upon the earth; and, How we are to understand the account given by Mofes, who reprefents the Antediluvians, not as an innocent race, quietly reposing on the ever-verdant turf, but as a corrupt generation, by whom "the earth was filled with violence."

One of the most extraordinary circumstances which Of the lonoccurs in the Antodiluvian history, is the vast length of gevity of human lives in those first ages, in comparison with our the Ant own. Few persons now arrive to eighty or an hundred years; whereas, before the flood, they frequently lived to near a thousand: a disproportion almost incredible, though supported by the joint testimonies of sacred and profane writers. Some, to reconcile the matter with probability, have imagined that the ages of those first men might possibly be computed, not by folar years, but months; an expedient which reduces the length of their lives rather to a shorter period than our own. But for this there is not the least foundation; besides the many absurdities that would thence follow, fuch as their begetting children at about fix years of age, as some of them in that case must have done, and the contraction of the whole interval between the creation and the deluge to confiderably lefs than two hundred years, even according to the larger

computation of the Septuagint.

Again: Josephus, the Jewish historian, and some Christian divines, are of opinion, that before the flood, and some time after, mankind in general did not live to fuch a remarkable age, but only a few beloved of God, fuch as the patriarchs mentioned by Mofes. They reason in this manner: Though the historian records the names of fome men whose longevity was fingular, yet that is no proof that the rest of mankind attained to the same period of life, more than that every man was then of a gigantic stature, because he says, in those days there were giants upon the earth. Besides, had the whole of the Antediluvians lived so very long, and increased in numbers in proportion to their age, before the flood of Noah, the earth could not have contained its inhabitants, even supposing no part of it had been sea. And had animals lived as long, and multiplied in the fame manner as they have done afterwards, they would have confumed the whole produce of the globe, and the stronger would have extinguished many species of the weaker. Hence they conclude, that, for wife and good ends, God extended only the lives of the patriarchs, and a few belide, to fuch an extraordinary length.

But most writers maintain the longevity of mankind in general in the early world, not only upon the authority

Antedilu- authority of facred, but likewise of profane history. And for such a constitution, the moral reasons are abundantly obvious. When the earth was wholly un-Moral rea-peopled, except by one pair, it was necessary to endow fons for this men with a stronger frame, and to allow them a longer longevity. continuance upon earth for peopling it with inhabitants. In the infant state of every mechanical art, relating to tillage, building, clothing, &c. it would require many years experience to invent proper tools and instruments to ease men of their labour, and by multiplied essays and experiments to bring their inventions to any degree of maturity and perfection. Every part of their work must have been exceedingly arduous from fuch a penury and coarseness of tools, and must have required longer time and more strength of body than afterwards, when mechanical knowledge was introduced into the world. If parents at this period had not continued long with their children, to have taught them the arts of providing for themselves, and have defended them from the attacks of wild beafts, and from other injuries to which they were expoled, many families would have been totally extinguished. But one of the best and most valuable ends which longevity would answer was, the transmitting of knowledge, particularly of religious knowledge, to mankind. And thus, before writing was invented, or any fuch eafy and durable mode of conveyance was found out, a very few men served for many generations to instruct their posterity, who would not be at a loss to consult living and authentic records.

19 Natural

The natural causes of this longevity are variously ascauses of it figured. Some have imputed it to the sobriety of the Antediluvians, and the fimplicity of their diet; alleging that they had none of those provocations to gluttony, which wit and vice have fince invented. Temperance might undoubtedly have some effect, but not possibly to fuch a degree. There have been many temperate and abstemious persons in later ages, who yet seldom have exceeded the usual period .- Others have thought that the long lives of those inhabitants of the old world proceeded from the strength of their stamina, or first principles of their bodily conflitutions: which might, indeed, be a concurrent, but not the fole and adequate cause of their longevity; for Shem, who was born before the deluge, and had all the virtue of the antediluvian constitution, sell three hundred years short of the age of his forefathers, because the greatest part of his life was passed after the flood.—Others have imputed the longevity of the Antediluvians to the excellency of their fruits, and some peculiar virtue in the herbs and plants of those days. But to this supposition it has been objected, that as the earth was curfed immediately after the fall, its productions we may suppose gradually decreased in their virtue and goodness till the flood; and yet we do not fee the length of men's lives decreafed confiderably, if at all, during that interval. Waving this objection, as the import of the curse is variously interpreted, it appears certain that the productions of the earth were at first, and probably continued till after the deluge, of a different nature from what they were in future times. Buffon supposes this difference may have continued gradually to diminish for many ages fublequent to that catastrophe. The surface of the globe (according to his theory) was in the first ages of the world less solid and compact; because, gravity

having acted only for a short time, terrestrial bodies Antediluhad not acquired their present density and consistence. The produce of the earth, therefore, must have been analogous to its condition. The furface being more loofe and moift, its productions would of course be more ductile and capable of extension: Their growth, therefore, and even that of the human body, would require a longer time of being completed. The foftness and ductility of the bones, muscles, &c. would probably remain for a longer period, because every species of food was more foft and fucculent. Hence the full expansion of the human body, or when it was capable of generating, must have required 120 or 130 years; and the duration of life would be in proportion to the time of growth, as is uniformly the case at present: For if we suppose the age of puberty, among the first races of men, to have been 130 years, as they now arrive at that age in 14 years, the age of the Antediluvians will be in exact proportion to that of the present race; fince by multiplying these two numbers by seven, for example, the age of the present race will be 98, and that of the Antediluvians will be 910. The period of man's existence, therefore, may have gradually diminished in proportion as the surface of the earth acquired more folidity by the constant action of gravity: and it is probable, that the period from the creation, to the days of David, was sufficient to give the earth all the denfity it was capable of receiving from the influence of gravitation; and confequently that the furface of the earth has ever fince remained in the fame flate, and that the terms of growth in the productions of the earth, as well as the duration of life, have been invariably fixed from that period.

It has been further supposed, that a principal cause of the longevity under confideration was the wholesome constitution of the Antediluvian air, which, after the deluge, became corrupted and unwholesome, breaking, by degrees, the pristine crass of the body, and shortening men's lives, in a very few ages, to near the present standard.

The temperature of the air and seasons before that catastrophe are upon very probable grounds supposed to have been constantly uniform and mild: the burning heats of fummer and the feverities of winter's cold were not then come forth, but fpring and autumn reigned perpetually together: And indeed, the circumstance above all others most conducive to the prolongation of human life in the postdiluvian world appears to be an equal and benign temperature of climate (see the article Longevity); whence it seems reasonable to infer, that the same cause might have produced the same effect in the Antediluvian world.

Whether flesh was permitted to be eaten before the Whether deluge, is a question which has been much debated. any slesh By the permission expressly given to Noah, for that might be purpose, after the flood, and God's affigning vege-fore the tables only for food to man, as well as beaft, at theflood. creation, one would imagine it was not lawful before: yet others have supposed, that it was included in the general grant of power and dominion given to Adam by God over the animal creation; and the distinction of beafts into clean and unclean, which was well known before the flood, is infifted on as a ftrong argument on

But in answer to this it has been observed, that if

Antedilu- fo, it doth not appear what occasion there was to renew this grant after the flood, and to add, " Every moving thing that liveth shall be meat for you, even, as the green herb have I given you all things." This furely implies that the green herb and fruits of the trees were all that was granted to man at first; but now, over and above that, was added the grant of, animal food: for in a deed or gift, all is specified that is given or granted, and whatever is not expressly mentioned is excluded or not given. Here man's food is appointed and specified; what is not expressly mentioned is therefore referved and not granted. Besides, this grant or appointment of man's food respected not Adam only, but all his posterity, till an additional grant was made.

To the animals no further grant was made than at first; but to man another was made immediately after his fall and expulsion from Paradife, implied in these words: "In the sweat of thy face shalt thou eat bread, till thou return into the ground." This was in truth a punishment for his transgression, as well as a grant of other food, but yet what was now become necessary to him. Paradife was no doubt planted with the most excellent fruits, sufficient to have suflained his life in health and vigour in his innocent flate: but after his transgression, being thrust out from that happy abode, and having then only the fruits of the common earth to feed on; which were not so nutritious as those of Paradile, he stood in need of something else to sustain life; and therefore bread produced by culture and other preparations for his food was now added, which before was not necessary, and thence called the staff of life. This feems a plain reason why bread was added after he came to live on the common earth; though perhaps another reason also for that addition may be given from the change that happened in man's body after his fall. Bread being now become the staff of life, Cain, the first man born, became a tiller of the ground, or an husbandman; as the next in birth, Abel, became a keeper or feeder of sheep.

As to the distinction between clean and unclean, this folely respected animals offered in sacrifice in the Antediluvian world; as is evident from hence, that Noah, upon his coming out of the ark "took of every clean beaft and of every clean fowl, and offered burnt offerings unto the Lord;" and that upon the grant of animal food to him and his posterity, which was posterior in time to the facrifice, there is not the least mention of any diffinction between clean and unclean with respect to food, but the very contrary, since the grant runneth, " Every moving thing that liveth shall be meat for you, even as the green herb have I given you all things." That distinction of clean and unclean as to food, came in with the law of Moses, and was different from that of facrifices, there being feveral creatures clean for food which were not to be offered in

But another objection here occurs. What occasion was there for keeping sheep, when none of them could be eaten? In answer to this, it has been observed, that sheep and other animals might at this period be of great use to men besides yielding them food. Their flocks, no doubt, confifted of fuch creatures as were of the domestic kind, and such as by the divine law were pronounced clean and fit for being offer-

ed in facrifice; therefore numbers would be kept for Antediluthis very purpose. Their skins, besides serving men as garments, might answer many other valuable intentions. Vestments of hair and wool foon succeeded the ruder coverings of skins; consequently great profit would be derived from such animals as could be shorn, especially in countries where the inhabitants led a pastoral life and dwelt in tents. And we afterwards find that Abel's facrifice was of this kind. They might use feveral of these animals, as they still do in some parts of the world, for bearing of burdens and drawing of carriages; for we may take it for granted that the first inventions for easing men of labour, would be of the fimplest kind, and such as came easiest to hand. But keeping flocks of sheep, goats, and such like, would be of great utility, by affording quantities of milk, which is found to be the most nourishing diet both to the young and the old; and their carcases, though not used as food, might answer some useful purposes per-

haps in manuring the foil.

The Antediluvian world was, in all probability, Increase of stocked with a much greater number of inhabitants mankind than the present earth either actually does, or perhaps before theis capable of containing or supplying. This seems na-flood. turally to follow from the great length of their lives, which exceeding the prefent standard of life in the proportion, at leaft, of ten to one, the Antediluvians must accordingly in any long space of time double themfelves, at least in about the tenth part of the time in which mankind do now double themselves. It has been supposed that they began to beget children as early, and left off as late, in proportion, as men do now; and that the feveral children of the same father fucceeded as quickly one after another as they usually do at this day: and as many generations, which are but fuccessive with us, were contemporary before the flood, the number of people living on the earth at once would be by that means fufficiently increased to answer any defect which might arise from other circumstances not considered. So that, if we make a computation on these principles, we shall find, that there was a confiderable number of people in the world at the death of Abel, though their father Adam was not then 130 years old; and that the number of mankind before the deluge would eafily amount to above one hundred thousand millions (even according to the Samaritan chronology), that is, to twenty times as many as our prefent earth has, in all probability, now upon it, or can well be supposed capable of maintaining in its present constitution.

The following table, made upon the above mentioned principles by Mr Whiston, shows at least what a number of people might have been in the Antediluvian world.

Number of 486 32480 mankind.	Year of the world.	Year of doubling.	Series.

fuch a number, upon the whole, as might be thought Antedilufufficient to people the earth. 3: In that calculation the two material points, the time of nursing and the age of puberty, are quite overlooked, by which all computations of the numbers in the Antediluvian world must be regulated. What unavoidable mistakes this omission must occasion, will be feen by examining the first ten numbers of the said table.

	1	4	2	Adam and Eve
Years of the world and intervals of doubling.	2	Number of increase according to the intervals.	4	Cain and Abel

		•		

On this table it may be observed, 1. That though there were but two persons created at first, this computation makes four perfons in the fecond year of the world. This could not possibly be, except Cain had been born within 12 months after the creation, which is highly improbable, and Abel in the fecond year, yet far more improbable; for in that case Eve could not have fuckled Cain.

2. In the fixth year of the world we have eight perfons, that is, fix children of Eve's in fix years. "But Cockburn, (our author adds) what shall Eve do with fix infants P. 108. in fix years? Where could she find so many wet nurses for them? Or would the mother of all living deny her children that nourishment which the Creator had appointed for their first food, the milk in her breasts? Do they consider that there was but one woman in the world to do for herself, her husband, and her children, what belongs to women to do? We should surely have more respect and compassion for the mother of all mankind, than to lay fuch an intolerable burden upon her, whose forrow for her own deception, and thereby ruining both herfelf and her husband, must have been very great for many years. In punishment of which, though God had faid he would greatly multiply her forrow and conception, the meaning was not, that she should have a child every year, which could not be, because the nature of that food and nourishment appointed by himfelf for her children would not permit it. Nor yet when he commanded them to increase and multiply and replenifb the earth, could the command be obeyed in fuch a manner as was contrary to the order of nature and providence. But the method intended to answer the defign of the command was to prolong their lives to above 800 and 900 years, and their prolific powers for 340 or 360 years of that term of life, that by flow and fure and long continuance of increase they might people the earth in due time."

3. The same exception lies to all the following periods of doubling, where the number far exceeds what it could possibly be in fact; but we shall pass them over, and come to the last of them in the year 110, in which the number of mankind is made 2048. Now in the year 110 not one of Adam's children were mar-

" Cockburn luge.

Antedilu.

wiane.

But according to a later * writer upon the fubject, upon the De- the above table, though the numbers there may be thought sufficient for the peopling of the earth, we could by no means depend upon, for feveral reasons; particularly,

Objections to Mr Whiston's table.

1. It is laid down there as a foundation, that the Antediluvians would double themselves every forty years; as indeed they would, and in less time, after there came to be 100 marriages. Now, had the author observed this regular progression in his computation, by adding 40 years to every former period of the age of the world, the amount, instead of two millions of millions, &c. would have been above five millions of millions at the year 1656, the age of the world at the deluge, according to the Hebrew numbers, which he contends for. What would the fum then have been, had we carried on the computation for 600 years more, according to the Septuagint?

2. He supposes the period of doubling must have been much shorter in the earliest ages, and much longer in the later, contrary to reason and fact. For mankind being fprung from one pair only, the increase at first must have been very slow, but come on very fast when a confiderable number were married. His table therefore is made not regularly, but according to fancy, by unequal starts or chasms, at great intervals in the latter part, where it should have been most regular; it would feem with no other view than to raife

Antedilu- ried, because not yet come to the age of puberty. In that year of the world there could be no more than 18 or 20 persons, at single births, besides Adam and Eve. It is a great mislake therefore to imagine, that the periods of doubling were much shorter in the earlier times than in the latter; the confrary of which is evi-

dent to reason. According to our author, two errors have been fallen Id. p. 81. into treating of this point; namely, 1. That in the first ages of the world, both before and after the Flood, men began to propagate their kind as early as they commonly do at present. 2. That the children of the fame father succeeded one after another as fast as they do now, that is, that the women brought forth chil-Of the ages dren every year. The first of these errors he confutes, of pulerty by shewing that the several periods or stages of man's among the life bear a just proportion to one another, and to the whole term of life; and that the period of puberty or maturity has not been the fame at all times, but is according to the length or brevity of life in the different ages of the world, according to that remark of St Augustine, Tanto serior fuit proportione pubertas, quanto vita totius major annofitas. Moses, he observes, gives the age of the world from the creation to the deluge, and from that period to his own time chiefly by generations. A generation is the interval of years between the births of father and fon. This the Latins call atas, and the Greeks yene. Now, a generation, or the interval of years between father and son, has not been, neither possibly could be, the same in all ages from the beginning, as Vossius justly observes; but has varied greatly according to the length or brevity of man's life in the feveral periods of the world. Since the ordinary term of man's life has been reduced to 70 and 80 years, the time of puberty is in proportion to this brevity of life, and reckoned at 20 or 21, which is the fourth part of a life of fourfcore. The several stages of human life are infancy, childhood, youth, manhood, full age, declention, old or decrepit age; all which commonly bear a proportion to the whole term of life. Now the bounds and limits of these several stages cannot be precisely the same in all, but vary in respect of the disposition of men's bodies, their course of life, and also the places and ages in which they live. In the Antediluvian world then, when men lived to upwards of 800 and 900 years, can it be thought that they passed through the several stages of life in as short time as men do now, who seldom exceed 80, and not one in ten arrives at that age? But if the Antediluvians arrived at puberty or manhood as foon as men do now, then would the several stages of human life have been loft or confounded, and men would have flarted from childhood to manhood at once, without any due or regular intervals, contrary to the order of nature: But if, according to the present economy of nature, man is but a youth at 20, which is a fourth part of our term of life, we may reasonably conclude, there would be a fuitable proportion of years in a much longer term of life, fince nature is constant and uniform in her operations. And though in fo long a life as the Antediluvians enjoyed, the time of puberty might be a fifth or a fixth part of their term of life, yet would they be but youths at 150 or 160; which bears much the fame proportion to the whole of their life as 20 is to that of ours.

Vol. II. Part I.

The other is an error, he thinks, which could never Ancell:have been fallen into, had it been confidered, that every mother fuckled her own children in those early days; and indeed where could the have found another to have done it for her?

Taking it for granted, then, that it was an univerfal custom for women to fuckle their children as well before as after the flood, the next question is, for how long time they continued nurses? He shows various instances, that when man's life was reduced to 130 or 140 years, the ordinary time of nurfing was two years: Of the time he thence infers, that for three or four generations af-allotted for ter the flood, when men lived to about 400 years, the nurfing in time would be fo much longer in proportion, and would these early not be less than three or four years; and consequently not be less than three or four years; and consequently, that before the flood, when life was protracted to 800 or 900 years, it would be fill longer in proportion to their longevity; fo that five years might be the ordi: nary time of nurfing in the Old World; and therefore that we cannot reckon less than fix years between the births. For man's life being prolonged to fo many hundred years at first for the more speedy peopling of the earth, he came by flow degrees to mature age, there being a long time required to rear up a body that was to last near 1000 years. The intervals therefore of infancy, childhood, youth, and mature age, were fo much longer in proportion to ours as the difference is between our term of life and theirs: and 150 or 160 years, with respect to their longevity, was no more in proportion than 20 is to the brevity of our life. As the Antediluvians therefore were fo very long Diffance in growing up to mature age, he concludes that the between the time of nurfing could not be shorter than five years, bitths. and that the distance between the births in a regular

Upon the whole, he thinks it evident that there could be no fuch speedy increase of mankind at the beginning as is imagined; that the time of nursing above specified was no more than necessary for that strength of constitution which was to last for 800 and 900 years; and that women who were to continue bearing children for 340 or 360 years of their life, should have them but flowly, and at the diffance of several years, that their ftrength might hold out, and that they might not be overburthened with too many cares at once; and therefore, when Eve's first child was six years old, it was time enough for her to have another, and fo on, though possibly sometimes twins.

way must be set at fix years.

These points being discussed, he proceeds, 1. To Cockburn's compute what number upon the whole might be born calculation into the world from the creation to near the time of of the inthe deluge; and then, 2. To flate the needful de-create of manking. ductions for deaths and other deficiencies.

I. 1. How long the parents of mankind continued in paradife, we know not; though longer perhaps than is commonly imagined. We shall even suppose two or three years, in which time there was no child born, nor any attempt towards it. We shall allow them two or three years more to lament their fall, and the miferable estate their want of faith and disobedience had brought them to; from a most happy condition; and Suppose Cain to be born fix years after the creation (in which supposition few, probably, will be apt to think us too hafty), and Abel again fix years after him, and fo every fixth year Eve to have had a child, the full

Antedilu- feren, eight, or nine whereof were probably all males (the males being longer in coming to maturity than the females); and this distance between the births will also be thought a sufficient allowance. At this rate of increase Adam would have in 100 years 16 children, in 200 years 32, and in 400 years 64 children; when we will suppose Eve to have left off child-bearing. Nor need this number of Adam's children be thought too great, when there are instances in these later ages, and this short period of man's life, of those who have had 40 children at fingle births by two fuccessive wives, and of many others who have had 20, 25, and 30, by one wife; though in fuch cases it is not to be supposed that the women fuckled their children.

> 2. Though it is reasonable to think that the Antediluvians, notwithstanding their longevity, came to mature age at 150; yet as we are not fure that they all married fo foon as they were ripe for marriage, and that the earliest in the genealogies is born in the 162d year of his father, who might probably be a first born, our author does not suppose Cain, Abel, or any of the fucceeding children or grandchildren of Adam to have married till they were 160, but to have had children from 161 or 162 till they were of the age of 500, at the fore-named distance or interval between the births; though Noah we know had three fons after he was 500, at the due intervals. And to all the Antediluvians we may allow, without fear of exceeding, 50 or 54 children in general, according to the course of nature, and the longevity of those first ages of the world.

> 3. Let us next inquire in what number of years the men of that world might double themselves, notwithstanding the long interval between the births. The increase indeed will be found very small for the first 300 or 400 years, as they were late in coming to maturity; but the fucceeding ages will fwell the account exceedingly. Let us suppose at present (what shall be proved afterwards) that in the year of the world 500, there were 200 persons only, male and semale, of full age to marry, the men at 160, the women at 120 or thereabout. The first or second year after the marriage will probably produce 100 births from 100 couple, and every fixth year after 100 more. At this flow progression the 200 married persons will, in 19 or 20 years, be increased to 600: so that the number of mankind would be trebled in 20 years, after there came 100 pair to be married. And in this manner they would increase and multiply every 20 years, or in that fpace treble themselves.

> It may perhaps be objected, that though it appears that fuch an increase might be at first from the sirst 100 marriages, yet they could not continue thus to multiply at fuch periods; because, according to the rule we have laid down, none of the iffue of these 100 first marriages could increase the number of mankind till the men had attained the age of 160. It is true they could not: but then it must be remembered, that the first 100 pair are still adding every fixth year 100 more to the number of mankind, even till after the 400 born in the first 20 years are married, and begin a new flock for increase; so that when there came to be some hundred couples married, the increase and multiplication would come on very fast, and in 1000 years mankind would be prodigiously increased.

But though there be nothing in this supposition con- Antedilus trary to reason, viz. That after the year of the world 500, they might treble themselves in 20 years; yet we will not reckon upon fo short an interval, but will allow a much longer time even to their doubling themfelves, and shall exhibit two tables of doubling; the first at the interval of 50 years (much too long indeed), the other at the interval of 40 years, and both beginning at the year 500, when there could not be fewer (whatever more there might be) than 100 married or marriageable persons descended from Adam and Eve.

This table is calculated at the long interval of 50 years, that it may appear that even by under-rating the number of mankind, there would be fo many millions born into the world before the deluge came, that they would be obliged to spread themselves over the face of the earth, though but one half of the fum total of 429,496 millions had been alive at the time of the deluge; but as the interval here allowed may appear to be too long for the time of doubling, the second is calculated at the interval of 40 years, which comes nearer to the truth of the case, though even this may exceed the time of doubling.

The first table is brought down no lower than to the year 2050, and the fecond to the year 2020, though there remain by the first 206, and by the second 236 years to the flood: the reason is, that in those last 200 years of the world, mankind would not increase in any measure equal to what they had done in the preceding years (though regularly the increase should have been much greater); because that violence was then great in the earth, and thousands, yea millions, might have been cut off by untimely deaths; for which cause the world's destruction was determined 120 years before the flood came.

Dijection miwered.

II. But now against this immense number of mankind that might in a regular and ordinary way have been born into the world between the creation and the deluge in 2056 years, it will no doubt be objected by fome (as it has been done to far less numbers), that all fuch calculations are mere guels work, the product of fruitful imaginations.

But it should be considered, that in calculations of this nature some regular order or method must be obferved: and though, according to the course of nature, fuch an increase and multiplication of mankind there might have been periodically especially at the beginning, when the command was to increase and multiply and replenish the earth; yet we will not suppose that all things went on thus regularly, without difference or interruption. We do not know what extraordinary ob-Aructions or interruptions there might be to fuch a regular increase. Though every married pair might by Antediluthe course of nature have had such a number of children as has been mentioned, yet the Divine Providence might order it otherwise in manifold inflances, and it might possibly be in the Old World as it has been fince the flood, viz. that fome marriages have produced many children, others few, and some none at all. Allowing, therefore, for all fuch obstructions and deficiencies, and likewife for all cafualties and accidents (to which men might be liable in that world at well as in the present), in as ample a manner as can be desired, let the former number be reduced to one half, viz. to 27,487,790,694,400, that is, 27 billions, or millions of millions, four hundred and eighty-feven thousand feven hundred and ninety millions, fix hundred and ninety-four thousand and four hundred. And this we shall now suppose to be the whole number of those who were born into the world before the deluge. But from this fum is to be subtracted the number of those who died before that time.

Of those in the genealogies from Adam by Seth, Enoch was translated at the age of 365, Lamech the father of Noah died just before the flood at 753, Mahalaleel at 895. Adam and the other five patriarchs lived to above 900. Before the year 900, therefore, we may suppose there were no deaths except that of Abel, who was flain, a young man, but that all born within that period were alive together. But in the tenth century death began to reign, and Adam and Eve, we may prefume, were the first over whom death had power in a natural way, as their disobedience was the cause of it. The children also born of them in the first hundred years would also die in this toth century, those born in the second hundred would die in the 11th. those born in the third century would die in the 12th, and fo on. But though we are far from thinking that after the beginning of the 10th century (till which time few or none died), the deaths would be equal to the births; yet as we have made large concessions all along, we shall do the same in this case, and suppose them upon the whole to have been equal, especially fince we cannot precifely fay how long that violence or bloodshed, which was their crying fin, came to prevail; and therefore will reduce the last sum mentioned to one half again, to allow for the deaths and prevailing violence, and suppose the total number of mankind alive upon earth at the time of the deluge to have been no more than 13,743,895,347,200, that is, 13 billions, or millions of millions, feven hundred and forty-three thousand eight hundred and ninety-five millions, three hundred and forty-feven thousand and two hundred; a number vastly exceeding that of the present inhabitants of the whole earth.

Notwithstanding the very large allowances and abate-Probabilit ments made to reduce the number of mankind, yet even of the abo the last reduction to 13 billions, or millions of millions, calculation &c. feems fo vaftly great, that it will hardly be thought possible that fuch a number of men could ever be at one time upon the earth. Now, though we pretend to no certainty in this point (which made it the more requifite to allow largely for deaths and deficiencies), yet the calculation we have given must appear highly probable, fince it is founded upon grounds certain and undeniable: for instance,

Antediluvians. 1. It cannot be denied but that the Antediluvians were come to the age of puberty and marriage at 160 years, when we find a fon born in 162. Nor,

2. Can it be faid, that they could not have children at the age of 500, when we have an inflance of one that had three fons at due diffances after that age. Neither,

3. Can it be alleged that we have not allowed a due distance or interval between the births, viz. six years, when most will be of opinion that it could not be so long. Nor yet.

long. Nor yet,

4. Can it be judged that we have made the period of doubling far too short, when we had before showed that after 100 marriages consummated, they would treble themselves in half the time we have taken for their doubling. Nor,

5. Will any one make a doubt, but that there might be 200 persons of mature age for marriage in the year of the world 500, the men at 160, the women younger. Nevertheless, as this is the foundation of our calculation we shall now show that there was at least such a number of persons marriageable at that age of the world.

It may be observed, that as we take 160 for the year of maturity and marriage, according to that period all married or marriageable in the year 500 must have been born in or before the year 340; the males at least, though the semales coming sooner to maturity, might some of them be born later or after the year 380. Now, according to this stated period of marriage,

1. In or before the year 340, Adam might have had 54 children, males and females, or 27 pair married or

fit for marriage.

2. Cain, whom we suppose to be but six years younger than Adam (which by the by is more than others allow), and to have married in the year 166, might have in the year 340, 28 children, or 14 pair six for marriage which added to the former, makes 41 pair.

3. Abel married fix years later, that is, in the year 172, and whom we shall suppose slain in the year 225 or 226, could in that case have no more than eight or nine children, or four pair, which with the former make 45 pair.

4. Adam's third fon married in the year 178, will afford us in the year 340, 26 children, or 13 pair, which increase the number of marriageable persons to

58 pair.

5. A fourth fon of Adam's married in the year 184, will give us in the year 340, 25 children, or 12 pair; which makes the number of pairs 70.

6. A fifth son of Adam's married in the year 190, might in the year 340 have 24 children, or 12 pair again, which increase the former number to 82 pair.

7. A fixth fon of Adam's married in the year 196, would have in the year 340, 22 children, or 11 pair; which added to the former make up 93 pair.

8. A feventh fon of Adam's married in the year 202, will, in the year 340, give us 20 children, or 10 pair; which makes in the whole 103 pair, already three pair more than we reckoned upon. I need therefore go no faither on to the eighth or ninth fon; but the following eight or nine births I may reafonably take to have been daughters, and married to the brothers that preceded them.

Here are now no more than 14 children of Adam's married, who have given us the 100 pair we have reckoned upon, and three over. We might yet have 13 pair to bring into the account, all born before the year 340, and marriageable in the year 500, which would very much increase the number of mankind. And by this the reader may perceive that we have been far from building on uncertain or precarious foundations, since we have omitted 13 pair more, which we might have taken into the account. And if it be considered that the command given to Adam was to increase and multiply and replenish the earth, no doubt can be made, but that his own and his children's marriages were fruitful in the procreation of children, that the earth might be inhabited.

ANTEGO. See Antigua.

ANTEJURAMENTUM, by our ancestors called juramentum calumnia, an oath which anciently both accuser and accused were to take before any trial or purgation.—The accuser was to swear that he would prosecute the criminal; and the accused to make oath, on the day he was to undergo the ordeal, that he was innocent of the crime charged against him.

ANTELOPE, in zoology. See CAPRA.

ANTELUCAN, in ecclesiastical writers, is applied to things done in the night or before day. We find frequent mention of the antelucan affemblies (Catus antelucani) of the ancient Christians in times of perfecution for religious worship.

ANTEMURALE, in the ancient military art, denotes much the fame with what the moderns call an out-

work.

ANTENATI, in modern English history, is chiefly understood of the subjects of Scotland, born before King James the First's accession to the English crown, and alive after it. In relation to these, those who were born after the accession were denominated Postnati. The antenati were considered as aliens in England, whereas the postnati claimed the privilege of natural subjects.

ANTENCLEMA, in oratory, is where the whole defence of the person accused turns on criminating the accuser. Such is the defence of Orestes, or the oration for Milo: Occisus est, fed latro. Exsecus, fed raptor.

ANTENICENE, in ecclefiaftical writers, denotes a thing or person prior to the first council of Nice. We say the Antenicene faith, Antenicene creeds, Antenicene fathers.

ANTENNÆ, in the history of infects, slender bodies with which nature has furnished the heads of these creatures, being the same with what in English are called borns or feelers. See Entomology.

ANTENOR, a Trojan prince, came into Italy, expelled the Enganians on the river Po, and built the city of Padua, where his tomb is faid to be still extant.

ANTEPAGMENTA, in the ancient architecture, the jambs of a door. They are also ornaments, or garnishings, in carved work, of men, animals, &c. made either of wood or stone, and set on the architrave.

ANTEPENULTIMA, in grammar, the third fyllable of a word from the end, or the last fyllable but

two.

ANTEPILANI, in the Roman armies, a name given to the hastati and principes, because they marched next before the triarii, who were called *pilani*.

ANTEPILEPTICS,

ANTÉPILEPTICS, among physicians, medicines Antepileptics efteemed good in the epilepfy.

ANTEPOSITION, a grammatical figure, where-Anthem. by a word, which by the ordinary rules of fyntax ought to follow another, comes before it. As when, in the Latin, the adjective is put before the substantive, the verb before the nominative case, &c.

ANTEPREDICAMENTS, among logicians, certain preliminary questions which illustrate the doctrine

of predicaments and categories.

ANTEQUIERA, a handsome town of Spain, in the kingdom of Granada, divided into two parts, the upper and lower. The upper is feated on a hill, and has a castle: the lower stands in a fertile plain, and is watered with a great number of brooks. There is a large quantity of falt in the mountain; and five miles from the town, a fpring famous for the cure of the gravel. W. Long. 4. 40. N. Lat. 36. 51.

ANTERIOR, denotes something placed before an-

other, either with respect to time or place.

ANTEROS, in mythology, one of the two Cupids who were the chief of the number. They are placed at the lost of the Venus of Medicis; this is represented with a heavy and fullen look, agreeably to the poetical description of him, as the cause of love's ceasing. The other was called Eros.

ANTESIGNANI, in the Roman armies, foldiers placed before the flandards, in order to defend them, according to Limpfius; but Casar and Livy mention the antefignani as the first line, or first body, of heavyarmed troops. The velites, who used to skirmish before the army, were likewise called antesignani.

ANTESTATURE, in fortification; a small retrenchment made of palisadoes, or sacks of earth, with a view to dispute with an enemy the remainder of a

piece of ground.

ANTESTARI, in Roman antiquity, fignifies to bear witness against any one who refused to make his appearance in the Roman courts of judicature, on the day appointed, and according to the tenor of his bail. The plaintiff, finding the defendant after fuch a breach of his engagement, was allowed to carry him into court by force, having first asked any of the persons present to hear witness. The person asked to bear witness in this case, expressed his consent by turning his right ear, which was instantly taken hold of by the plaintiff, and this was to answer the end of a subpoena. The ear was touched upon this occasion, says Pliny, as being the feat of memory, and therefore the ceremony was a fort of caution to the party to remember his engagement.

ANTEVIRGILIAN HUSBANDRY, an appellation given to Mr Tull's new method of horse-hoeing hus-

bandry. See AGRICULTURE.

ANTHELION. See Corona and Parhelion. ANTHELIX, in anatomy, the inward protuberance of the external ear, being a semicircle within, and almost parallel to the helix. See Anatomy.

ANTHELMINTICS, among physicians, medi-

cines proper to destroy worms.

ANTHEM, a church fong performed in cathedral service by choristers, who sung alternately. It was used to denote both pfalms and hymns, when performed in this manner. But, at present, anthem is used in a more confined fenfe, being applied to certain passages taken out of the scriptures, and adapted to a particular so- Anthonia. Anthems were first introduced in the reformed fervice of the English church, in the beginning

of the reign of Queen Elizabeth.

ANTHEMIS, CAMOMILE: A genus of the polygamia superflua order, belonging to the syngenesia class of plants; and in the natural method ranking under the 40th order, Composite discoides. The essential characters are these: The receptaculum is chaffy; there is no pappus; the calvx is hemispheric and subequal; and the florets of the ray are more than five. Of this ge-

nus Linnæus enumerates 17

Species; of which the most remarkable are the following. 1. The nobilis, or common camomile, grows in plenty upon commons, and other waste land. It is a trailing perennial plant, which puts out roots from the branches, by which it spreads and multiplies greatly. Of this kind there is a variety with double leaves. Formerly this plant was used for planting of walks; which, when moved and rolled, looked well for fome time; but as it was subject to decay in large patches, the walks became unlightly, and it was therefore difused. 2. The pyrethrum, or pellitory of Spain, is a perennial plant, which grows naturally in Spain and Portugal, from whence the roots are brought to Britain. The branches trail upon the ground, and spread a foot or more each way; these are garnished with fine winged leaves like those of the common camomile. At the extremity of each branch is produced one large fingle flower, like camomile, but much larger; the rays of which are of a pure white within, but purple on the outfide. After the flowers are past, the receptacle swells to a large scaly cone, having the feeds lodged between its scales; but unless the season is dry, the seeds will not come to perfection in this country. 3. The tinctoria, with fawed-winged leaves; is a perennial plant, which flowers from June to November, and makes a very pretty appearance, some of the flowers being of a white, others of a sulphur, and some of a bright yellow colour. 4. The Arabica, with a branching empalement. The feeds of this species were brought from Africa by the late Dr Shaw, and distributed to many curious botanists in this and other countries of Europe. It grows near two feet high, with an upright stem, having a fingle flower at the top, from whose empalement there are two or three footstalks put out horizontally, about two inches long, each having a fingle flower fmaller than the first, like the childing marigold, or hen-and-chicken daify.

Culture. The first fort may be very easily propagated by procuring a few flips in the fpring, and planting them about a foot dillant from one another, where they will foon cover the ground. The other forts may be propagated from feeds fown in the spring, and will require no other care than to be kept free from weeds: only the third fort must be transplanted when come upfrom the feeds into borders near shrubs, where they may have room to grow; for they spread very wide, and therefore require to be placed three feet distant from other plants.

Medicinal Uses. The first and second forts are used in medicine. The first have a strong, not ungrateful, aromatic smell, and a very bitter nauseous taste. They are accounted carminative, aperient, emollient, and in fome measure anodyne; and stand recommended in fin-

Anthers, tulent colies, for promoting the uterine purgations, in they must be kept clear of weeds during the summer; Anthespha Antheri- spasmodic pains, and the pains of childbed-women: fometimes they have been employed in intermittent fevers, and the nephritis. These flowers are frequently also used externally in discutient and antiseptic fomentations, and in emollient clysters. They enter the decoclum pro enemate and decoclum pro fomento of our pharmacopæias. An effential oil was formerly directed to be prepared from them, but it is now omitted. A fimple watery infusion of them taken in a tepid state, is at prefent frequently employed to promote the operation of emetics. The root of the pyrethrum is the only part endowed with medical virtue. It has no fenfible fmell; its tafte is very hot and acrid, but less so than that of arum or dracunculus: the juice expressed from it has scarce any acrimony, nor is the root itself so pungent when fresh as after it has been dried. Water, affished by heat, extracts some share of its taste, rectified spirit the whole; neither of them elevate any thing in distillation. The principal use of pyrethrum in the present practice is as a masticatory, for promoting the falival flux, and evacuating viscid humours from the head and neighbouring parts; by this means it often relieves the toothach, some kinds of pains of the head, and lethargic complaints.

ANTHERA, among botanists, that part of the stamen which is fixed on the top of the filamentum, within the corolla: it contains the pollen or fine dust, which, when mature, it emits for the impregnation of the plant, according to Linnaus. The APEX of Ray, Tournef.

and Rivin.; Capfula flaminis, of Malpighi.

ANTHERICUM, SPIDER-WORT: A genus of the monogynia order, belonging to the hexandria class of plants; and, in the natural method, ranking under the 10th order, Coronaria. The characters are: There is no calyx: The corolla confifts of fix oblong petals which are expanding: The flamina confift of fix subulated erect filaments; the antheræ are small and furrowed: The pistillum has a three-cornered germen, a simple stylus, and obstuse stigma: The pericarpium is an ovate trifulcated capfule, with three cells and three valves: The feeds are numerous and angular. Of this genus Linnæus reckons up nine

Species. But only the three following feem to deferve notice. 1. The ramofum, with a branching stalk. 2. The liliago. These are perennial plants, which are natives of Spain, Portugal, and other warm countries. They were formerly pretty common in the English gardens; but the severe winter of 1740 killed most of their roots. They flower in June and July, and the feeds are ripe in September. 3. The frutescens, with a shrubby stalk, was formerly known among the gardeners near London by the name of onion-leaved aloe. It produces many ligneous branches from the root, each supporting a plant with long taper leaves in shape like those of an onion, and full of a yellow pulp very juicy. These plants send out roots, which run down and fasten themselves unto the earth, by which they multiply greatly. The flowers are produced on long loofe spikes, are yellow, and appear at different times, so that the plants are never long destitute of flowers. This species is a native of the Cape of Good Hope.

Culture. The two first are propagated by seeds, which should be sown in the autumn, in a warm situation, on a bed of light fandy earth. When the plants come up

and in autumn when the leaves decay, they should be carefully taken up and transplanted into a bed of light earth, at a foot distance from one another. If the win-Anthoceros ter prove severe, they should be covered with straw, peafe-haulm, or old tan. The third likewife requires shelter in winter; though some of them will live in the open air, if planted close to the warm wall.

ANTHESPHORIA, in antiquity, a Sicilian festival instituted in honour of Proferpine. The word is derived from the Greek and of, flower and ofen, I carry; because that goddess was forced away by Pluto when she was gathering flowers in the fields. Yet Festus does not ascribe the feast to Proserpine; but says it was thus called by reason ears of corn were carried on this day to the temples. - Anthesphoria seems to be the same thing with the florisertum of the Latins, and answers to the harvest-home among us.

ANTHESTERIA, in antiquity, was a feast celebrated by the Athenians in honour of Bacchus. The most natural derivation of the word is from the Greek and flos), a flower, it being the custom at this feast

to offer garlands of flowers to Bacchus.

The anthesterialasted three days, the 11th, 12th, and 13th of the month; each of which had a name fuited to the proper office of the day. The first day of the feast was called milowyia, i. c. opening of the vessels, because on this day they tapped the vessels, and tasted the wine. The fecond day they called xoos, congii, the name of a measure containing the weight of 10 pounds; on this they drank the wine prepared the day before. The third day they called xolgon, kettles: on this day they boiled all forts of pulse in kettles; which however they were not allowed to tafte, as being offered to Mer-

ANTHESTERION, in ancient chronology, the fixth month of the Athenian year. It contained 29 days; and answered to the latter part of our November and beginning of December. The Macedonians called it defion or defion. It had its name from the festival an-

thesteria kept in it.

ANTHISTIRIA, in botany: A genus of the trigynia order, belonging to the triandria class of plants; and, in the natural method, ranking under the 4th order, Gramina. The characters are: The calyx is a four-valved glume, equally cleft to the base: The corolla is a two-valved glume: The flamina confift of three short slender filaments; the antheræ oblong and erect: The pistillum has an oblong germen; the styli are two; and the stigmata are clavated and hairy: There is no pericarpium, except a closed ealyx: The feed is oblong and furrowed. There is only one species of this grass, the ciliata or fringed anthistiria, a native of India.

ANTHOCEROS, or HORN-FLOWER: A genus of the order of algæ, belonging to the cryptogamia class of plants; and, in the natural method, ranking under the 57th order, Alga. The effential characters are: The calyx of the male is fessile, cylindric, and entire; the antheræ (one) is subulated, very long, and two-valved: The calyx of the female is monophyllous, divided into fix parts, and expanding: The feeds are about three, naked and roundish .- There are only three species of the anthoceros, viz. the punctatus or spotted anthoceros, a native of Britain; the lævis, a native of

Europe

Anthony.

Antholo- Europe and America; and the multifidus, a native of Germany. It is found in moist shady places, and on heaths.

ANTHOLOGION, the title of the service book used in the Greek church. It is divided into 12 months, containing the offices fung throughout the year, on the festivals of our Saviour, the Virgin, and other remarkable faints.

ANTHOLOGY, a discourse of slowers, or of beautiful passages from any authors.—It is also the name given to a collection of epigrams taken from several

Greek poets.

ANTHOLYZA, MAD-FLOWER: A genus of the monogynia order, belonging to the triandria class of plants; and in the natural method ranking under the 6th order, Enfata. The effential characters are these: The calyx is tubular, irregular, and bent back; and

the capfule is beneath the flower.

Species. 1. The ringens, whose flower-flips spread afunder. This hath red, round, bulbous roots, from which arise several rough furrowed leaves, near a foot long, and half an inch broad: between these comes out the flower stalk immediately from the root, which rifes two feet high, is hairy, and hath feveral red flowers coming out on each fide. These appear in June, and the feeds ripen in September. 2. The spicata, with narrow furrowed leaves, is in shape and fize like the vernal crocus, but the outer skin is thin and white; from this arise five or six long narrow leaves, which are deeply furrowed. Between these arise the flower stem, which is a foot and a half high, bending on one fide towards the top, where the flowers come out on one fide, standing erect. They are of a white colour, appear in May, and the feeds ripen in August. Both these species are natives of Africa, from whence their feeds were first obtained, and raised in the Dutch gardens.

Culture. The antholyza may be propagated by offfets, which it fends off in pretty great plenty; or by feeds, which are fometimes perfected in Europe. Thefe should be fown soon after they are ripe, in pots of light earth; which, if plunged in old beds of tan which has loft its heat, and shaded in the middle of the day in hot weather, they will come up the following winter: therefore they must be kept covered with glasses to screen them from cold, otherwise the young plants will be destroyed. They may remain in the pots two years, if the plants are not too close, when they will have acquired strength enough to bear transplanting; the proper time for which is in July and August, when their leaves are decayed. In fummer the pots may be placed in the open air, but in winter they must be placed under a hothed frame; or in the green house, where they are a great ornament when in flower.

ANTHONY (St), was born in Egypt in 251, and inherited a large fortune, which he distributed among his neighbours and the poor, retired into folitude, founded a religious order, built many monafteries, and died anno 356. Many ridiculous stories are told of his conflicts with the devil and of his miracles. There are

deven epiftles extant attributed to him.

St Anthony is sometimes represented with a fire by his fide, fignifying that he relieves persons from the inflammation called after his name; but always accompanied by a hog, on account of his having been a swine-

herd, and curing all disorders in that animal. To do Anthony him the greater honour, the Romanists in several places keep at common charges a hog denominated Anthorif-St Anthony's bog, for which they have great veneration. Some will have St Anthony's picture on the walls of their houses, hoping by that to be preferred from the plague; and the Italians, who do not know the true fignification of the fire painted at the fide of their faint, concluding that he preserves houses from being burnt, invoke him on fuch occasions. Both painters and poets have made very free with this faint and his followers: the former, by the many ludicrous pictures of his temptation; and the latter, by divers epigrams on his disciples or friars; one of which is the following, printed in Stephen's World of Wonders:

Once fedd'st thou, Anthony, an herd of swine, And now an herd of monks thou feedest still-For wit and gut alike both charges bin; Both loven filth alike; both like to fill Their greedy paunch alike: nor was that kind More beaftly, fottish, swinish, than this last. All else agrees: one fault I only find,

Thou feedest not thy monks with oaken mast.

Anthony, or Knights of St Anthony, a military order, inflituted by Albert duke of Bavaria, Holland, and Zealand, when he defigned to make war against the Turks in 1382. The knights wore a collar of gold made in form of a hermit's girdle, from which hung a stick cut like a crutch, with a little bell, as they are represented in St Anthony's pictures.

St ANTHONY also gives the denomination to an order of religious founded in France about the year 1095, to take care of those afflicted with St Anthony's fire: (fee the next article.)—It is faid, that, in fome places, these monks assume to themselves a power of giving, as well as removing, the ignis facer, or cryfipelas; a power which stands them in great slead for keeping the poor people in subjection, and extorting alms. To avoid the menaces of these monks, the country people present them every year with a fat hog a piece. Some prelates endeavoured to perfuade Pope Paul III. to abolish the order; questuarios istos sundi Anthonii, qui decipiunt rusticos et simplices, eosque innumeris superstitionibus implicent, de medio tollendos effe. But they subiift, notwithtianding, to this day, in feveral places.

St ANTHONY's Fire, a name properly given to the Apparently it took this denomination, eryfipelas. as those afflicted with it made their peculiar application to St Anthony of Padua for a cure. It is known, that anciently particular difeafes had their peculiar faints: thus, in the ophthalmia, persons had recourse to St Lucia; in the toothach, to St Apollonia; in the

hydrophobia, to St Hubert, &c.

ANTHORA, in botany, the trivial name of a species of aconitum. See Aconitum.

ANTHORISMUS, in rhetoric, denotes a contrary description or definition of a thing from that given by the adverse party.—Thus, if the plaintiff urge, that to take any thing away from another without his knowledge or confent, is a theft; this is called eges, or definition. If the defendant reply, that to take a thing away from another without his knowledge or confent, provided it be done with defign to return it to him a. gain, is not theft; this is an Arbogramos.

ANTHOSPERMUM,

* Sthofper-

ANTHOSPERMUM, the AMBER TREE: A genus of the diecia order, belonging to the polygamia class of plants; and in the natural method ranking under Anthropo- the 47th order, Stellate. The effential characters are: The cally of the hermaphrodite flower is divided into four parts; there is no corolla; the stamina are four, and the pistilli two; the germen is beneath the flower. Male and female on the fame or separate plants.

Species. Of this genus Linnaus mentions three; the Æthiopica, ciliare, and herbacea; but the first is most generally known in the gardens of the curious. Its beauty confifts in its small evergreen leaves, which grow as close as heath. These being bruised between the fingers, emit a very fragrant odour; whence the name amber tree.

Culture. This plant is casily propagated by cuttings during any of the fummer months, in a border of light earth; where they will take root in fix weeks time, provided they are watered or shaded as the season may require; or if they are planted in pots plunged in a moderate hotbed, they will take root the sooner, and there will be a greater certainty of their growing. They must be frequently renewed by cuttings, as the old plants are very subject to decay, and seldom last above three or four years.

ANTHOXANTHUM, or vernal grass: A genus of the digynia order, belonging to the diandria class of plants; and in the natural method ranking under the 4th order, Gramina. The effential characters are: The calyx is a bivalved gluma, with one flower; the corolla is bivalved, obtuse, and without any awn.

There are three species of anthoxanthum; viz. the odoratum, or spring grass, a native of Britain; the indicum, a native of India; and the paniculatum, a native of the fouthern parts of Europe. The odoratum is one of the earliest spring grasses, and is extremely common in our fertile pastures. The delightful fmell of new-mown hay is chiefly from this plant. Cows, horses, sheep, and goats, eat it.

ANTHRACIS, Anthracias, of Anthracitis, names promiseuously used by ancient naturalists for very different fossils, viz. the carbuncle, hæmatites, and a kind of asteria. See CARBUNCLE, &c.

ANTHRACOSIS, in medicine, a corrofive fealy ulcer either in the bulb of the eye or the eyelids.

ANTHRAX, a Greek term, literally fignifying a burning coal, used by the ancients to denote a gem, as well as a disease, more generally known by the name of carbuncle.

ANTHRAX is sometimes also used for lithauthrax or pit coal. See LITHANTHRAX.

ANTHROPOGLOTTUS, among zoologists, an appellation given to fuch animals as have tongues refembling that of mankind, particularly to the parrot

ANTHROPOGRAPHY, denotes the description of the human body, its parts, structure, &c. See Ana-

ANTHROPOLATRÆ, in church history, an appellation given to the Nestorians, on account of their worshipping Christ, notwithstanding that they believed him to be a mere man.

ANTHROPOLATRIA, the paying divine honours to a man; supposed to be the most ancient kind of idolatry.

ANT'HROPOLITES, a term denoting petrifac- Anthropotions of the human body, as those of quadrupeds are lites. called zoolites.

It has been doubted whether any real human petrifactions ever occur, and whether those which have been supposed such were not mere lusus nature. But the generality of naturalists best versed in this branch affure us of real anthropolites being fometimes found. And indeed, as it is univerfally admitted that the zoolites are frequently feen, what negative argument therefore can be brought against the existence of the others? Are not the component parts of the human body nearly fimilar to those of the brute creation? Consequently, correspondent matter may be subject to, and acquire, the like accidental changes, wherever the fame power or causes concur to act upon either object. If the former are not so common, it may be accounted for, in some measure, by reflecting that human bodies are generally deposited in select and appropriated places; whereas the bones of animals are difperfed everywhere, and falling into various beds of earth, at a greater or less depth, there is more probability of their encountering the petrifying agent. Could we credit fome authors who have treated on this subject, they will tell us of entire bodies and skeletons that were found petrified. One in particular, discovered at Aix in Provence anno 1583, in a rocky cliff, the cerebrum whereof, when firuck against a piece of steel, produced sparks, the bones being at the same time friable. The reports of Happel and Kircher are too abfurd for belief. Van Helmont's strange relations, together with those of Jean à Costa, must also be rejected as fabulous. Scheuhzer has published an engraved figure, which he calls the Antediluvian man: how far it is authentic, it would be rash to fay. It is, however, afferted by many respectable writers on natural history, that whole skeletons petrified have been brought to light from certain old mines, which remained closed up and disused for several centuries. These indeed are acknowledged to be very rare. Yet it is a known fact, that detached parts, osteolithi, are sometimes sound, especially in situations where either the water, the soil, or both, have been observed to possess a strong putrescent quality. The human vertebræ, fragments or portions of the tibia, and even the whole cranium itself, have been feen in an absolute state of petrification. Some of these are said to appear vitriolated or mineralized. As to the petrified bones of pretended giants, they are more probably real zoolites, the bones of the larger animals. All these bones are found in various states, and under different appearances. Some are only indurated; others calcined, vitriolated, or mineralized; fome, again, are simply incrusted; whilst others have been proved completely petrified. Notwithstanding what is here advanced, it may be granted that a positive lusus nature, in some hands, is repeatedly mistaken for a real petrification. They are, however, diftinguishable at all times by an experienced naturalist; particularly by the two following rules: First, We may determine that fossil a lusus nature which, on a strict examination, is observed to deviate in any material degree from the true res analogica existens. Secondly, By the same parity of reasoning, those fossil shells are to be esteemed certain petrifications, and genuine Antediluvian reliquie, in which, on a compariAnthropo- son with their analogues collected from the sea, there appears an exact conformity in fize and figure. This comparative observation will hold good for all fossils; Anthropo- that is, such as present themselves either under the , animal or vegetable form. It is nevertheless worthy of notice, that all testaceous fossils are not petrified; fince some kinds of them have been found in beds of fand, which retained their original perfect shape and quality, but at the same time they proved very brittle, indeed scarcely bearing the most gentle touch. Shells of this description are always diffoluble by acids, in contradiftinction to the petrified or calcareous fosfil shells, whose property it is to resist the action of such like menstrua. See further the article PETRIFACTION.

ANTHROPOLOGY, a discourse upon human na-

Anthropology, among divines, denotes that manner of expression by which the inspired writers attribute human parts and passions to God.

ANTHROPOMANCY, a species of divination, performed by inspecting the entrails of a human crea-

ANTHROPOMORPHA, a term formerly given to the primates of that class of animals which have the greatest resemblance to the human kind.

ANTHROPOMORPHISM, among ecclefiaftical writers, denotes the herefy or error of the Anthropomorphites. See the next article.

ANTHROPOMORPHITES, in church history, a fect of ancient heretics, who, taking every thing fpoken of God in Scripture in a literal fense, particularly that paffage of Genefis in which it is faid God made man after his own image, maintained that God had a human thape. They are likewise called Audeans, from Audeus their leader.

ANTHROPOMORPHOUS, fomething that bears the figure or refemblance of a man. Naturalitts give instances of authropomorphous plants, anthropomorphous minerals, &c. These generally come under the class of what they call lusus nature, or monsters.

ANTHROPOPATHY, a figure or expression by which some passion is ascribed to God, which properly belongs only to man.

ANTHROPOPHAGI, (of everyon a man, and Pays to eat, Men-eaters.) That there have been, in almost all ages of the world, nations who have followed this barbarous practice, we have abundance of tellimonies.

The Cyclops, the Leftrygons, and Scylla, are all repreleuted in Homer as Anthropophagi, or man-eaters; and the female phaintoms, Circe and the Sirens, first bewitched with a show of pleasure, and then destroyed. This, like the other parts of Homer's poetry, had a foundation in the manner of the times preceding his own. It was still, in many places, the age spoken of by Orpheus.

When men devour'd each other like the beafts, Gorging on human flesh .-

According to Herodotus, among the Essedonian Scythians, when a man's father died, the neighbours brought feveral beafts, which they killed, mixed up their sees with that of the deceased, and made a feast. Among the Massagetz when any person grew old, they killed him and ate his flesh; but if he died of fick-Vol. II. Part I.

nefs, they buried him, efteeming him unhappy. The Anthropse same author also assures us, that several nations in the 1k gi-Indies killed all their old people and their fick, to feed on their flesh t he adds, that persons in health were fometimes accused of being sick, to afford a pretence for devouring them. According to Sextus Empiricus, the first laws that were made, were for the prevention of this barbarous practice, which the Greek writers represent as universal before the time of Orpheus.

Of the practice of anthropophagy in later times, we have the testimonies of all the Romish missionaries who have visited the internal parts of Africa, and even some parts of Afia. Herrera speaks of great markets in China, furnished wholly with human flesh, for the better fort of people. Mincus Paulus speaks of the like in his time, in the kingdom of Concha towards Quinfay, and the island of Zapengit; others, of the great Java; Barbofa, of the kingdom of Stam and island of Sumatra; others, of the islands in the gulf of Bengal, of the country of the Samogitians, &c.

The philotophers Diogenes, Chrysippus, and Zeno, followed by the whole fect of Stoics, affirmed, that there was nothing unnatural in the eating of human fleth; and that it was very reasonable to use dead bodies for food, rather than to give them a pray to worms and putrefaction. Is order to make the trial, however, whether there was any real repugnancy in nature to the feeding of an animal with the flesh of its own species, Leonardus Floroventius fed a hog with hog's flesh, and a dog with dog's flesh; upon which he found the briftles of the hog to fall off, and the dog to become full of ulcers.

When America was discovered, this practice was found to be almost univertal, insomuch that several authors have supposed it to be occasioned through a want of other food, or through the indolence of the people to feek for it; though others afcribe its origin to a spirit of revenge.

It appears pretty certain from Dr Hawkefworth's account of the Voyages to the South Seas, that the 14habitants of the island of New Zealand, a country use furnished with the necessaries of life, cat the bodies of their enemies. It appears also to be very probable, that both the wars and anthropophagy of thefe favages take their rife and owe their continuance to irrefulible necessity, and the dreadful alternative of destroying each other by violence, or of perishing by hunger. See Vol. III. p. 447, et seq. and Vol. II. p. 389, &c.

Mr Marsden also informs us, that this horrible cufrom is practifed by the Battas, a people in the island of Sumatra. " They do not eat human flesh (fays he) as a means of fatisfying the cravings of nature, owing to a deficiency of other food; nor is it fought after as a gluttonous delicacy, as it would feem among the New Zealanders. The Battas eat it as a species of ceremony; as a mode of showing their detestation of crimes, by an ignominious punishment; and as a horrid indication of revenge and infult to their unfortinate enemies. The objects of this barbarous repair are the prisoners taken in war, and offenders convicted and condemned for capital crimes. Persons of the former description may be ransomed or exchanged, for which they often wait a confiderable time; and the latter fuffer only when their friends cannot redeem them by the customary fine of twenty beenchangs, or eighty dollars

Anthropo dollars. These are tried by the people of the tribe where the fact was committed, but cannot be execu-Anthropo-ted till their own particular raja or chief has been acquainted with the fentence; who, when he acknowledges the justice of the intended punishment, sends a cloth to cover the delinquent's head, together with a large dish of falt and lemons. The unhappy object, whether prisoner of war or malefactor, is then tied to a flake: the people affembled throw their lances at him from a certain distance; and when mortally wounded, they run up to him, as if in a transport of passion; cut pieces from the body with their knives; dip them in the dish of salt and lemon juice; slightly broil them over a fire prepared for the purpose; and swallow the morfels with a degree of favage enthusiasm. Sometimes (I prefume according to the degree of their animofity and refentment) the whole is devoured; and instances have been known, where, with barbarity still aggravated, they tear the flesh from the carcass with their mouths. To fuch a depth of depravity may man be plunged, when neither religion nor philosophy enlighten his steps! All that can be faid in extenuation of the horror of this diabolical ceremony is, that no view appears to be entertained of torturing the fufferers; of increasing or lengthening out the pangs of death; the whole fury is directed against the corfe; warm indeed with the remains of life, but past the fenfation of pain. I have found a difference of opinion in regard to their eating the bodies of their enemies flain in battle. Some perfons long resident there, and acquainted with their proceedings, affert that it is not customary; but as one or two particular instances have been given by other people, it is just to conclude, that it fometimes takes place, though not generally. It was supposed to be with this intent that raja Neabin maintained a long conflict for the body of Mr Nairne, a most respectable gentleman and valuable servant of the India Company, who fell in an attack upon the campong of that chief, in the year 1775."

It may be faid, that whether the dead body of an enemy be eaten or buried, is a matter perfectly indifferent. But whatever the practice of eating human flesh may be in itself, it certainly is relatively, and in its consequences, most pernicious. It manifestly tends to eradicate a principle, which is the chief fecurity of human life, and more frequently restrains the hand of the murderer, than the fenfe of duty or the dread of punishment. Even if this horrid practice originates from hunger, still it must be perpetuated from revenge. Death must lose much of its horror among those who are accustomed to eat the dead; and where there is little horror at the fight of death, there must be less repugnance to murder. See some further observations on this subject, equally just and ingenious, by Dr Hawkefworth, ut supra.

ANTHROPOPHAGIA, the act or habit of eating human flesh. This is pretended by some to be the effect of a difease, which leads people affected with it to eat every thing alike. Some choose only to conlider it as a species of Pica. The annals of Milan furnish an extraordinary instance of anthropophagy. A Milanese woman named Elizabeth, from a depraved appetite, like what women with child, and those whose meufes are obstructed, frequently experience, had an my meible inclination to human flesh, of which she

made provision by enticing children into her house, Anthropos. where she killed and falted them; a discovery of which having been made, she was broken on the wheel and burnt in 1519.

ANTHROPOSCOPIA, from ανθεωπος, and σκοπεω, I consider, the art of judging or discovering a man's character, disposition, passions, and inclinations from the lineaments of his body. In which fense, anthroposcopia seems of somewhat greater extent than phyfiognomy or metoposcopy. Otto has published an Anthroposcopia, sive judicium hominis de homine ex lineamentis er ternis.

ANTHROPOTHYSIA, the inhuman practice of offering human facrifices. See SACRIFICE.

ANTHUS, in ornithology, a fynonyme of a species of loxia. See Loxia.

ANTHYLLIS, KIDNEY-VETCH, or Lady's finger: A genus of the decandria order, belonging to the diadelphia class of plants; and in the natural method ranking under the 32d order, Papilionacea. The effential characters are: The calyx is ventricose, and the legumen is roundish and covered.

Species. Linnæus enumerates nine species; of which the following feem to be most worthy of attention, 1. The vulneraria, with unequal winged leaves, is a native of Spain and Portugal, as likewise of Wales. It is a biennial plant, having fingle leaves at bottom, which are oval and hairy; but those which grow out of the stalks are winged, each being composed of two or three pair of lobes terminated by an odd one. The flowers grow collected into heads at the top of the flalks, are of a bright scarlet colour, and make a pretty appearance. It flowers in June and July, and the feeds ripen in October. 2. The montana or herbaceous woundwort, with winged leaves, grows naturally in the mountains in the fouth of France, and in Italy. It is garnished with winged leaves, which have an equal number of hairy lobes at the extremity of the branches. The flowers are produced in heads, and are of a purple colour and globular form. They appear in June and July, and the feeds ripen in October. 3. The barba jovis, or filver bush, has its name from the whiteness of its leaves. This is a shrub which often grows to the height of ten or twelve feet, dividing into many lateral branches, garnished with winged leaves composed of an equal number of narrow lobes, which are very white and hairy: the flowers are produced at the extremities of the branches, collected into small heads; these are of a bright yellow colour, and appear in June; fometimes they are succeeded by short woolly pods, containing two or three kidney-shaped feeds: but unless the season proves warm, they do not ripen in this country. 4. The cytifoides, or shrubby woundwort; has long been known in the English gardens. It is a low shrub, feldom rising above two feet high, but sends out many flender branches, garnished with hoary leaves, which are fometimes fingle, but generally have three oval lobes, the middle being longer than the other two: the flowers are yellow, and come out from the fides of the branches, three or four joined together, having woolly impalements; but these are rarely succeeded by feeds in England.

Culture. The first and second forts require no particular management further than being kept free from weeds. The third and fourth may be propagated by 83

N

Annichrift.

Anthypo- cuttings planted during any of the fummer months; observing to flade and water them till they have taken good root; when they are to be transplanted into pots, and must always be housed in winter.

ANTHYPOPHORA, in rhetoric, a figure of speech; being the counter part of an hypophora. See

HYPOPHORA.

ANTI, a Greek preposition, which enters into the composition of several words, both Latin, French, and English, in different senses. Sometimes it signifies before, as an anti-chamber; and fometimes opposite or contrary, as in the names of these medicines, anti-scorbutic, anti-venercal.

ANTI, in matters of literature, is a title given to divers pieces written by way of answer to others, whose names are usually annexed to the anti. See the Anti of M. Baillet; and the Anti-Baillet of M. Menage: there are also Anti-Menagiani, &c. Casar the dictator wrote two books by way of answer to what had been objected to him by Cato, which he called Anti-Catones; these are mentioned by Juvenal, Cicero, &c. Vives affures us, he had feen Cæfar's Anti-Catones in an ancient library.

ANTIBACCHIUS, in ancient poetry, a foot confifting of three fyllables, the two first long, and the last one short; such is the word ambire.

ANTIBES, a sea port town of Provence in France, with a strong castle. Its territory produces excellent fruit; and the town stands opposite to Nice, in the Mediterranean. E. Long. 7. 5. N. Lat. 43. 35.

ANTICHAMBER, an outer chamber for strangers to wait in, till the person to be spoken with is at leifure.

ANTICHORUS, in botany: A genus of the monogynia order, belonging to the octandria class; of which the effential characters are: The calyx is a fourleaved perianthium: The corolla confifts of four expanding petals: The pericarpium is a capfule, above, subulated, with four cells and four valves: The feeds are very numerous. There is but one species, the depressus, a native of Arabia.

ANTICHRIST, among ecclefiastical writers, denotes a great adversary of Christianity, who is to appear upon the earth towards the end of the world-

We have demonstrations, disputations, and proofs, in great order and number, both that the pope is, and that he is not, Antichrist.

F. Calmet is very large in describing the father and mother of Antichrift, his tribe and pedigree, his wars and conquelts, his achievements against Gog, Ma-

Some place his capital at Constantinople, others at Jerusalem, others at Moscow, and some few at London; but the generality at Rome, though these last are divided. Grotius and some others suppose Rome Pagan to have been the feat of Antichrift: most of the Lutheran and reformed doctors contend earnestly for Rome Christian under the papal hierarchy. In fact, the point having been maturely debated at the council of Gap, held in 1603, a resolution was taken thereupon, to infert an article in the Confession of Faith, whereby the pope is formally declared to be Antichrift-Pope Clement VIII. was stung to the quick with this decision; and even King Henry IV. of France was not a little mortified, to be thus declared, as he faid, an imp of Antichrift. Antichrist.

M. le Clerc holds, that the rebel Jews and their leader Simon, whose history is given by Josephus, are to be reputed as the true Antichrift. Lightfoot and Vanderhart rather apply this character to the Jewish Sanhedrim. Hippolitus and others held that the devil himself was the true Antichrist; that he was to be incarnate, and make his appearance in human shape before the confumination of all things. Others among the ancients held that Antichrift was to be born of a virgin by some prolific power imparted to her by the A modern writer * of the female fex, whom * Bay'e's many hold for a faint, has improved on this fentiment; Dictionary, maintaining that Antichrift is to be begotten by the voce Bindevil on the body of a witch by means of the femen "you. of a man caught in the commission of a certain crime, and conveyed, &c.

Hunnius and some others, to secure Antichrist to the pope (notwithstanding that this latter seemed excluded by not being of the tribe of Dan), have broke in upon the unity of Antichrift, and affert that there is to be both an eaflern and a western Antichrist.

Father Malvenda, a Jefuit, both published a large work entitled Antichrifts, in which this subject is amply discussed. It consists of thirteen books. In the first he relates all the opinions of the fathers with regard to Antichrift. In the fecond, he fpeaks of the times when he shall appear; and shows, that all the fathers who supposed Antichrist to be near at hand, judged the world was near its period. In the third, he difcourses of his origin and nation; and shows that he is to be a Jew, of the tribe of Dan: this he founds on the authority of the fathers; on the passage in Genelis xlix. 17. Dan Shall be a ferfent by the way, &c.; on that of Jeremiah vini. 16. where it is faid, The armies of Dan shall devour the earth; and on Rev. vii. where St John, enumerating all the tribes of Israel, makes no mention of that of Dan. In the fourth and fifth books he treats of the figns of Antichrift. In the fixth, of his reign and wars. In the feventh, of his vices. In the eighth, of his doctrine and miracles. In the ninth, of his perfecutions: and in the rell, of the coming of Enoch and Elias, the conversion of the Jews, the reign of Jesus Christ, and the death of Antichrist, after he has reigned three years and a half. See also Lowman on the Revelation.

How endless are conjectures? Some of the Jews, we are told, actually took Cromwell for the Christ; while forne others have laboured to prove him Antichrift himself. Pfaffius affures us he saw a solio book in the Bodleian library, written on purpose to demonstrate this latter polition.

Upon the whole, the Antichrist mentioned by the apostle John, 1 Ep. ii. 18. and more particularly deferibed in the book of Revelation, feems evidently to be the same with the Man of Sin, &c. characterized by St Paul in his Second Epittle to the Thessalonians, ch. ii. And the entire description literally applies to the excelles of papal powers. Had the right of private judgment, fays an excellent writer, been always adopted and maintained, Antichrift could never have been; and when the facred right comes to be univerfully af-

tichrifti ferted, and men follow the voice of their own reason and consciences, Antichrist can be no more.

ANTICHRISTIANISM, a state or quality in per-Antidesma. fons or principles, which denominates them antichristiau, or opposite to the kingdom of Christ.

M. Jurieu takes the idea of the unity of the church to have been the fource of Antichristianism Had not mankind been infatuated with this, they would never have flood in fuch awe of the anathemas of Rome. It is on this the popes erected their monarchial power.

ANTICHRISTIANS, properly denote the follow-

ers or worshippers of Antichrist.

ANTICHRISTIANS are more particularly understood of those who set up or believe a salse Christ or Mes-

ANTICHTHONES, in ancient geography, an appellation given to the inhabitants of opposite hemi-

ANTICOR, or Anticolur among farriers, an inflammation in a horse's throat, being the same with the quinfy in mankind. See FARRIERY, XXXVII. 2.

ANTICOSTE, a barren island lying in the mouth of the river St Lawrence, in North America. W. Long.

64. 16. N. Lat. from 49. to 53.

ANTICYRA (anc. geog.), a town in Phocis, on the Counthian bay, opposite to Cirrha, lying to the west on the same bay. The Phoceans seizing the temple of Apollo at Delphi, a war, called the facred, commenced, and lafted ten years; when Philip, father of Alexander the Great, avenged the god by deftroying many of the cities of the pillagers. Anticyra was one of the number. It was again taken and subverted by Athlus a Roman general in the war with the Macedopians. It afterwards became famous for its hellchore. That drug was the root of a plant, the chief produce of the rocky mountains above the city, and of two kinds; the black, which had a purgative quality; and the white, which was an emetic. Sick perions reforted to Anticyra to take the medicine, which was prepared there by a peculiar and very excellent recipe: Hence the adage, Naviget Anticyrum, (Hor). By the port in the fecond century was a temple of Neptune, not large, built with felected flones, and the infide white-washed: the statue of brass. The agora or market-place was adorned with images of the fame metal; and above it was a well with a fpring, sheltered from the fun by a roof supported by columns. A little higher was a monument formed with fuch stones as occurred, and defigned, it was faid, for the fons of Iphitus. One of these, Schedus, was killed by Hector, while fighting for the body of Patroclus, but his bones were transported to Anticyra; where his brother died after his return from Troy. About two stadia or a quarter of a mile distant was a high rock, a portion of the mountain, on which a temple of Diana stood, the image bigger than a large woman, and made by Praxitoles. The walls and other edifices at Anticyra were probably erected, like the temple of Neptune, with stones or pebbles. The site is now called Asprospitia, or The White Houses; and some traces of the buildings from which it was so named remain. The port is landlocked, and frequented by vessels for corn. Some paces up from the fea is a fountain.

ANTIDESMA, in botany: A genus of the directa order, belonging to the pentandria class of plants. The

calys of the male is five leav'd; there is no corolla; the Antidicaambere are bifid: The female calyx is five leav'd; the marianites corolla is wanting; the fligmata are five: the terry is cylindric and one feeded. There is but one species, the alexiteria, a native of India.

ANTIDICOMARIANITES, ancient heretics who pretended that the Holy Virgin did not preferve a perpetual virginity, but that she had several children by Joseph after our Saviour's birth.—Their opinion was grounded on some expressions of our Saviour, wherein he mentions his brothers and his fifters; and of St Matthew, where he fays, that Joseph knew not Mary till she had brought forth her first born son. The Antidicomarianites were the disciples of Helvidius and Jovinian, who appeared in Rome toward the close of the fourth century

ANTIDORON, in ecclefiastical writers, a name given by the Greeks to the confecrated bread, out of which the middle part, marked with the cross, wherein the confecration refides, being taken away by the prieft, the remainder is distributed after mass to the poor. On the fides of the antidoron are impressed the words Jesus Christus vicit. The word is formed from does, donum, "a gift," as being given away loco muneris, or in charity. The antidoron is also called panis presantificatus. Some suppose the antidoron to be distributed in lieu of the faciament, to such as were prevented from attending in person at the celebration; and thence derive the origin of the word, the eucharilt being denominated doron, " gift," by way of cim-

ANTIDOSIS, in antiquity, denotes an exchange of estates, practifed by the Greeks on certain occafions with peculiar ceremonies, and first instituted by Solon.

When a person was nominated to an office, the expence of which he was not able to support, he had recourse to the antidosis: that is, he was to seek some other citizen of better fubltance than himfelf, who was free from this, and other offices; in which case the former was excused. In case the person thus substituted denied himself to be the richest, they were to exchange estates, after this manner; the doors of their houses were close shut up and sealed, that nothing might be conveyed away; then both took an oath to make a faithful discovery of all their effects, except what lay in the filver mines, which by the laws was excuted from all imposts; accordingly, within three days, a full discovery and exchange of estates was made.

ANTIDOTE, among physicians, a remedy taken to prevent, or to cure, the effects of poison, &c.

ANTIENT. See ANCIENT.

ANTIGONEA, or Antigonia (anc. geog.), a town of Bithynia, so called from Antigonus, the fon of Philip, and afterwards called Nicea (Strabo, Stephanus.) Another of Epirus, to the north of the Montes Ceraunii, opposite to the city of Oricum (Polybius, Ptolemy). A third of Arcadia, namely Mantinea, fo called in honour of King Antigonus (Plutarch, Paufanias.) A fourth in Macedonia, in the territory of Mygdonia (Pliny, Ptolemy). A fifth in the territory of Chalcidice, in Macedonia, on the east fide of the Sinus Thermaicus (Livy). A fixth of Syria, built by Antigonus, not far from Antioch, on the Orontes (Stephanus); but foon after destroyed by Antigonus Scleucus, who removed the inhabitants to Seleucia, a town built by him (Diodorus Siculus.) A feventh of Antigua. Troas, called Alexandria in Pliny's time.

ANTIGONUS, one of Alexander's commanders, to whom Asia fell. He conquered Eumenes, and expelled Scleucus out of Syria; who flying to Ptolemy Lagus in Egypt, a bloody war commenced betwixt him, Cassander, and Antigonus, wherein, by the help of his son Demetrius, Antigonus prevailed, and built the city Antigonia, anno Romæ 448. Afterward Cassander, Seleucus, and Lysmachus, uniting against him, routed him, in league with King Pyrihus, and slew him near Epirus, 301 years before Christ.

Antigonus, king of the Jews, was the son of Aristobulus. He entered into an alliance with the king of the Parthians, and besieged Jerusalem. He cut off his uncle Hircanus's ears, to incapacitate him for the high priesthood; and put Josephus, Herod's brother, to death. At length, Herod took him and sent him to M. Anthony; who, to gratify Herod, cut off his head, and thereby extinguished the Asmonians, who had reigned 126 years. This happened 36 years before Christ.

ANTIGRAPHUS, in antiquity, an officer of Athens, who kept a counterpart of the apodecti, or chief treasurer's accounts, to prevent mistakes, and keep them from being falsissed.

ANTIGRAPHUS is also used, in middle age writers, for a secretary or chancellor. He is thus called, according to the old glossarists, on account of his writing answers to the letters sent to his master. The antigraphus is sometimes also called archigraphus; and his dignity antigraphia, or archigraphia.

Antigraphus is also used in Isidorus for one of the notes of sentences which is placed with a dote to denote a diversity of sense in translations.

ANTIGRAPHUS is also applied in ecclesiastical writers to an abbreviator of the papal letters. In which sense the word is used by Pope Gregory the Great in his register. Of late days the office of antigraphus consists in making minutes of bulls from the petitions agreed to by his holiness, and renewing the bulls after engrossing.

ANTIGUA, one of the Antilles or Caribbee islands, fituated 20 leagues east of St Christopher's, in W. Long. 62. 5. and N. Lat. 17. 30. It is about 50 miles in circumference, and is reckoned the largest of all the British Iceward islands.

This island having no rivers, and but few springs, or fuch as are brackish, the inhabitants are obliged to preferve the rain water in cifferns. The air here is not fo wholesome as in the neighbouring islands, and it is more subject to hurricanes; but it has excellent harbours, particularly English Harbour, which is capable of receiving the largest man of war in the navy. Here is also a dock yard, supplied with all stores and conveniences for repairing and careening ships. The principal trade, however, is carried on in the harbour of St John's, the capital, fituated in the north-west part of the island, and which has water fufficiently deep for merchant vessels. The town of St John's was once in a very flourishing condition, as may be judged by the loss sustained at the late fire, which was computed at the amazing fum of 400,000l.

This island was first attempted to be settled by Sir

Thomas Warner, about the same time with St Chris-Antiqueler topher's and Nevis: but no establishment then took place. It was afterwards granted by Charles II. to Antimenfi-Lord Willoughby then governor of Barbadoes, who fettled a colony upon it in the space of a few years. In a fhort time, but by what means is not evident, it became again the public property. It raises at prefent about 16,000 hogsheads of sugar, which was at first of a very bad quality, unfit for the English market; but the planters have greatly improved their staple since, and it is now as good as in any of the other islands. It has continued unmolested in all the late wars with France. The number of white inhabitants is reckoned about 10,000. It is divided into five parishes; that of St John's Town, which is reckoned the capital of the north-west part, and consists of above 200 houses; those of Falmouth, Porham, and Bridge Town, on the fouth fide; and St Peters, which is no town, but lies almost in the middle of the island.

ANTIGUGLER, is a crooked tube of metal, fo bent as easily to be introduced into the necks of bottles, and used in decanting liquors, without disturbing them. For this purpose the bottle should be a little inclined, and about half a spoonful of the liquor poured out, so as to admit an equal quantity of air; let one end of the bent tube be stopped with the singer, whilst the other is thrust into the body of the liquor near to the bubble of air already admitted. When the singer is taken off, the bottle will have vent, and the liquor will run out steadily and undisturbed.

ANTIHECTICS, in pharmacy, medicines good in hectical diforders.

ANTIHECTICUM POTFRII, the name of a medicine formerly much celebrated, but now laid aide in common practice.

ANTILIBANUS (anc. geog.), a mountain of Cocleyria, which bounds it on the fouth, running parallel with Libanus: they both begin a little above the fea, Libanus near Tripolis, Antilibanus at Sidon: and both terminate near the mountains of Arabia, which run to the north of Damafeus, and the mountains of Traconitis, and there end in other mountains, (Strabo.) The Scripture, making no diffinction between Libanus and Antilibanus, calls them by the common name Lebanon.

ANTILLES, the French name for the CARIBBEE

ANTILOGARITHM, the complement of the logarithm of a fine, tangent, or fecant; or the difference of that logarithm from the logarithm of 90 degrees.

ANTILOGY, in matters of literature, an inconfiftency between two or more passages of the same book.

ANTILOPE. See CAPRA.

ANTIMENSIUM, a kind of confecrated tablecloth, occasionally used in the Greek church, in places where there is no proper altar. F. Goar observes, that in regard the Greeks had but sew consecrated churches, and that consecrated altars are not things easy to be removed: that church has, for many ages, made use of certain consecrated stuffs or lineas, called antimensia, to serve the purposes thereof.

Antimensium, in the Greek church, answers to the oliare pertable, or portable altar in the Latin church. They are both only of late invention, though

Habertus

Antimensia Habertus would have them as old as St Basil. But

|| Durant and Bona do not pretend to find them in any
Antimens, author before the time of Bede and Charlemagne.

ANTIMENSIA is also applied to other tables, used in offices of religion, besides those whereon the eucharist is administered: such, e. g. are those whereon the host is exposed, &c. The origin of the antimensia is described by Meursius; when the bishop had consecrated a church, the cloth which had been spread on the ground and over the communion table, was torn in pieces, and distributed among the priests, who carried

their churches and chapels. Not that it was necessary that such cloths should be laid on all tables; but only on those which either were not consecrated, or at least whose consecration was doubted of.

each a fragment away, to ferve to cover the tables in

ANTIMERIA, in grammar, a figure whereby one part of speech is used for another: e. g. velle suam ruique est, for voluntas sua cuique est; also, populus

late rex, for populus late regnans.

Antimeria, in a more restrained sense, is a figure where the noun is repeated instead of the pronoun. The antimeria is frequent in the Hebrew, and is sometimes retained in our version of the Old Testament accordingly: e. g. Hear my voice, ye voives of Lamech, for my voives, Gen. iv. 23.

ANTIMETABOLE, in rhetoric, a figure which

ANTIMETABOLE, in rhetoric, a figure which fets two things in opposition to each other. The word is Greek, compounded of art, against, and milason from usiason, I shift or transfer, i. e. shifting, or setting two things over-against each other. This figure is twice exemplified in an apophtheym of Musonius; which, on account of its excellence, is called aureum monitum, the golden maxim or precept.

Αν τι πραξης καλον μετα πουυ, ομεν πουος οιχεται, το δε

Αν τι ποιησής αισχεον μετα ηδονής, το μεν ήδυ οιχεται, το δε αισχεον μενει.

In English thus:

Allowing the performance of an honourable action to be attended with labour; the labour is foon over, but the honour immortal: whereas, should even pleasure wait on the commission of what is dishonourable, the pleasure is soon gone, but the dishonour eternal."

ANTIMETATHESIS, in rhetoric, is the inverfion of the parts or members of an antithesis. Such is that of Cicero in Verrem, Lib. IV. cap. 52. "Compare this peace with that war; the arrival of this governor with the victory of that general; his profligate troops with the invincible army of the other; the luxury of the former with the temperance of the latter: you will say, that Syracuse was sounded by him who took it; and taken by him, who held it when sounded."

ANTIMONARCHICAL, an appellation given to whatever opposes monarchical government.

ANTIMONIALS, in medicine, preparations of

antimony. See Pharmacy.

ANTIMONY, a blackish mineral substance, staining the hands, sull of long, shining, needle-like striæ, hard, brittle, and considerably heavy. It is found in different parts of Europe, as Bohemia, Saxony, Transylvania, Hungary, France, and England; commonly in mines by itself, intermixed with earth and stony matters. Sometimes it is blended with the richer ores of

filver, and renders the extraction of that metal difficult Antimony. by volatilizing a part of the filver; or, in the language of the miners, robbing the ore. See METALLURGY, for the different operations.

Antimony is the flibium of the ancients; by the Greeks called figure. The reason of its modern denomination, antimony, is usually referred to Basil Valentine a German monk, who, as the tradition relates, having thrown some of it to the hogs, observed, that, after purging them violently, they immediately grew fat upon it. This made him think, that, by giving his fellow monks a like dose, they would be the better for it. The experiment, however, succeeded so ill, that they all died of it; and the medicine thencefor-

ward was called antimony, q. d. anti-monk.

Uses. Antimony at fust was of service only in the composition of paint. Scripture describes it to us as a fort of paint, with which the women blackened their eyebrows. Jezebel, understanding that Jehu was to enter Samaria, painted her eyes with antimony; or, according to the Hebrew, "put her eyes in antimony." As large black eyes were thought the finell, they of both fexes, who were careful of their beauty, rubbed their eyes, eyelids, and round the eyes, with a needle dipped in a box of paint made of antimony, with a defign of blackening them.—At this day, the women of Syria, Arabia, and Babylonia, anoint and blacken themselves about the eyes; and both men and women put black upon their eyes in the defert, to preserve them from the heat of the sun and the picrcing of its rays. Mr Darvieux tells us, that the Arabian women border their eyes with a black colour made of tutty, which the Arabians call rebel. They draw a line of this kind of blacking without the corner of their eyes, to make them appear larger. Isaiah, in his enumeration of the feveral ornaments belonging to the daughters of Sion, has not forgot the needles which they made use of in painting their eyes and eyelids. Nor has this practice escaped the lash of Juvenal:

Ille supercilium madida suligine tinctum Obliqua producit acu, pingitque trementes Attollens oculos

Ezekiel, discovering the irregularities of the Jewish nation under the idea of a debauched woman, says, that she bathed and perfumed herself, and that she anointed her eyes with antimony. Job shows sufficiently how much antimony was in esteem, by calling one of his daughters a vessel of antimony, or a box to put paint in, cornu sibisi. The author of the book of Enoch says, that before the deluge the angel Azleel taught young women the art of painting themselves.

Tertullian and St Cyprian have declaimed very warmly against this custom of painting their eyes and eyebrows, which was much practised in Africa even by the men: Inunge oculos tuos non slibio diaboli, sed collyrio Christi, says St Cyprian. Pliny, speaking of the Roman ladies, says, that they painted their very eyes: Tanta est decoris affestatio, ut tingantur oculi quoque. Sardanapalus painted his eyes and eyebrows. Josephus reproaches the seditious with the same, who assumed the name of zealots, and made themselves masters of the temple of Jerusalem.

The modern uses of antimony are very numerous and important. It is a common ingredient in specula

Antimony or burning concaves, ferving to give the composition a finer texture. It makes a part in bell metal, and Antinomi- renders the found more clear. It is mingled with tin, , to make it more hard, white, and founding; and with lead, in the casting of printers letters, to render them more fmooth and firm. It is also a general help in the melting of metals, and especially in casting of cannon-balls. It is likewise made use of for purifying and heightening the colour of gold. See CHEMISTRY, GOLD, PURIFICATION, &c.

For a long time this mineral was esteemed poisonous. In 1566, its use was prohibited in France by an edict of parliament; and in 1609, one Besnier was expelled the faculty for having given it. The edict was repealed in 1650; antimony having a few years before been received into the number of purgatives. In 1668, a new edict came forth, forbidding its use by any but doctors of the faculty. It is now univerfally allowed, that pure antimony in its crude state has no noxious quality; and that though many of its preparations are most virulently emetic and cathartic, yet, by a slight alteration or addition, they lofe their virulence, and become mild in their operation. See CHEMISTRY and PHARMACY.

The virtues of antimony in the diseases of animals are greatly extolled. Pigs that have the measles are at all times recovered by it, which proves it a great purifier of the blood. Horses who have running heels that cannot be cured by the common methods used by the farriers, will generally be cured by this medi-The manner of using it is this: cine in a little time. Mix one drachm with every feeding of oats which the horse has in a morning. It is best put together in one place, buried under a few oats; and the horse's head being with-held a little, and then let go just against that place, he will take it all in at a mouthful. Some horses do not dislike it: others obstinately refuse it, but to these it may be easily given in balls. tues of this drug in fattening cattle have been thought imaginary, but experiment proves it to be a real truth. A horse that is lean and scabby, and not to be fatted by any other means, will become fat on taking a dofe of untimony every morning for two months together. A boar fed for brawn, and having an ounce of antimony given him every morning, will become fat a fortnight fooner than others put into the flye at the same time, and fed in the same manner, but without the antimony.

ANTINOE. See Enfine'."

ANTINOEIA, in antiquity, annual facrifices, and quinquennial games, in memory of Antinous the Bithynian. They were instituted at the command of Adrian the Roman emperor, at Mantinea in Arcadia, where Antinous was honoured with a temple and divine worthip.

ANTINOMIANS, in ecclesiastical history certain heretics who maintain the law of no use or obligation under the gospel-dispensation, or who hold doctrines that clearly superfede the necessity of good works and a virtuous life. The Antinomians took their origin from John Agricola about the year 1538; who taught, that the law is no ways necessary under the gospel: that good works do not promote our falvation, mor ill ones hinder it; that repentance is not to be

preached from the decalogue, but only from the go-Antinomi

This feet fprung up in England during the protect-Antiochtorate of Oliver Cromwell, and extended their system, of libertinism much farther than Agricola the disciple of Luther. Some of their teachers expressly maintained, that as the elect cannot fall from grace, nor forfeit the Divine favour, the wicked actions they commit are not really finful, nor are to be confidered as inflances of their violation of the divine law; and that confequently they have no occasion either to confess their fins, or to break them off by repentance. According to them, it is one of the effential and diffinctive characters of the elect, that they cannot do any thing which is either displcasing to God or prohibited by the law .- Luther, Rutherford, Schlusselburg, Sedgwick, Gataker, Witsius, Bull, Williams, &c. have written refutations; Crisp, Richardson, Saltmarsh, &c. defences, of the Antinomians; Wigandus, a comparison between ancient and modern Antinomians.

The doctrine of Agricola was in itself obscure, and perhaps represented worse than it really was by Luther, who wrote with acrimony against him, and first styled him and his followers Antinomians. Agricola flood on his own defence, and complained that opinions were imputed to him which he did not hold. Nicholas Amfdorf fell under the same odious name and imputation, and feems to have been treated more unfairly than even Agricola himself. It is rather hard to charge upon a man all the opinions that may be inferred from things that have halfily dropped from him, when he himfelf disavows such inferences.

ANTINOUS, the favourite of Adrian, was born at Bithynus in Bithynia. His beauty engaged the heart of Adrian in such a manner, that there never was a more boundless and extravagant passion than that of this emperor towards this youth. After his death, the emperor ordered divine honours to be paid him; and he also erected a city of his name. See Enfine'.

ANTIOCH, a city of Syria in Asia, situated on the river Orontes, in E. Long. 37. 5. N. Lat. 36. 20. It was built by Seleucus Nicator, founder of the Syro-Macedonian empire, who made it his capital. It flood on the above-mentioned river, about 20 miles from the place where it empties itself into the Mediterranean; being equally distant from Constantinople and Alexandria in Egypt, that is, about 700 miles from each. Seleucus called it Antiock, from his father's name, according to some; or from that of his son, according to others. He built 16 other cities bearing the same name; of which one, fituated in Pisidia, is probably that where the name of Christians was first given to the followers of Jesus Christ. But that situated on the Orontes, by far eclipfed, not only all the others of this name, but all the cities built by Seleucus. Antigonus, not long before, had founded a city in that neighbourhood, which from his own name he had called Antigonia, and defigned it for the capital of his empire; but it was rafed to the ground by Seleucus, who employed the materials in building his metropolis, and also transplanted the inhabitants thither.

The city of Antioch was afterwards known by the name of Tetrapolis, being divided as it were into four cities, each of them being furrounded with its proper Antioch wall, befides a common one which enclosed them all. The first of these cities was built by Seleucus Nicator, as already mentioned; the second by those who slocked thither on its being made the capital of the Syro-Macedonian empire; the third by Seleucus Callinicus; and the fourth by Autiochus Epiphanes.—About four or five miles diftant, flood a place called Daphne, which was nevertheless reckoned a suburb of Antioch. Here Seleucus planted a grove, and in the middle of it built a temple which he confecrated to Apollo and Diana, making the whole an afylum. To this place the inhabitants of Antioch reforted for their pleasures and diversions; whereby it became at last so infamous, that " to live after the manner of Daphne" was used as a proverb to express the most voluptuous and dissolute way of living. Here Lucius Verus, the colleague of M. Aurelius, chose to take up his residence, instead of marching against the Parthians; while his general Cassius forbade by proclamation any of his soldiers to enter or even go near the place. In short, so remarkable was Daphne of old, that the metropolis itself was diffinguished by it, and called Antioch near Daphne.

> Though Antioch continued to be, as Pliny calls it, the queen of the East, for near 1600 years; yet scarce any city mentioned in history hath undergone such calamities, both from the attacks of its enemies, and its being naturally subject to earthquakes .- The first difaster mentioned in history which befel the Antiochians happened about 145 years before Christ. Being at that time very much disaffected to the person and government of Demetrius their king, they were continually raifing tumults and feditions; infomuch that he found himself at last obliged to solicit assistance from the Jews; and was furnished by Jonathan, one of the Maccabees, with 3000 men; by which reinforcement, believing himfelf sufficiently strong to reduce the mutineers by force, he ordered them immediately to deliver up their arms. This unexpected order caufed a great uproar in the city. The inhabitants ran to arms, and invested the king's palace, to the number of 120,000 with a defign to put him to death. All the Jews hastened to his relief, fell upon the rebels, killed 100,000 of them, and fet fire to the city. On the destruction of the Syrian empire by the Romans, Antioch submitted to them as well as the other cities of that kingdom, and continued for a long time under their dominion. About the year 115, in the reign of the emperor Trajan, it was almost entirely ruined by one of the most dreadful earthquakes mentioned in history. Trajan himself happened to be there at that time, being returned from an expedition against the Parthians; fo that the city was then full of troops, and strangers come from all quarters either out of curiofity or upon business and embassies: the calamity was by this means felt almost in every province of the Roman empire. The earthquake was preceded by violent claps of thunder, unufual winds, and a dreadful noise under ground. The shock was so terrible, that great numbers of houses were overturned, and others toffed to and fro like a ship at sea. Those who happened to be in their houses were for the most part buried under their ruins: those who were walking in the firects or in the squares, were, by the violence of the shock, dashed against each other, and most of them either killed or dangerously wounded. This earthquake

continued, with fome small intermission, for many days Antioch. and nights; so that vast numbers perished. The most violent shock, according to the Acts of St Ignatius, was on a Sunday, December 23. By this Trajan was much hurt, but escaped through a window. Dion Casfius pretends, that he was taken out of the window by one who exceeded the human fize in tallness. The fame historian adds, that Mount Lison, which stood at a small distance from the city, bowed with its head and threatened to fall down upon it: that other mountains fell; that new rivers appeared, and others that had flowed before forlook their course and vanished. When the earthquake ceafed, a woman was heard crying under the ruins; which being immediately removed, the was found with a living child in her arms. Search was made for others; but none was found alive, except one child, which continued fucking its dead mother.

No doubt, Trajan, who was an eye-witness of this terrible calamity, would contribute largely towards the re-chablishment of Antioch in its ancient splendour. Its good fortune, however, did not continue long; for in 155, it was almost entirely burnt by accidental fire; when it was again restored by Antoninus Pius. In 176 or 177, the inhabitants having fided with Cassius, the above-mentioned Roman general, who had revolted from M. Aurelius, that emperor published a severe edict against them, deprived them of all their privileges, suppressed their public assemblies, and took from them the shows and spectacles to which they were greatly addicted: but his anger being soon appealed, he restored them to their former condition, and even condescended vo visit their city. In 194, having sided with Niger against Severus, the latter deprived them of all their privileges, and subjected Antioch as a mere village to Laodicea; but, however, pardoned them the next year. at the entreaties of his eldelt fon, then a child.

When the power of the Roman empire began to decline, Antioch became the bone of contention between them and the eaftern nations; and accordingly, on the breaking out of a Perlian war, it was almost always fure to fuffer. In 242, it was taken and plundered by Sapor; and, though he was defeated by Gordian, it underwent the same misfortune in the time of Valerian, about 18 years after; and after the defeat and captivity of Valerian, being taken by the Persian monarch a third time, he not only plundered it, but levelled all the public buildings with the ground. The Perlians, however, being foon driven out, this unfortunate city continued free from any remarkable calamity till about the time of the division of the Roman empire by Constantine in 331. It was then afflicted with fo grievous a famine, that a buffiel of wheat was fold for 400 pieces of filver. During this grievous diffress, Conflantine fent to the bishop 30,000 bushels of corn; besides an incredible quantity of all kinds of provisions, to be distributed among the ecclesiastics, widows, orphans, &c. In the year \$47, Constantine II. caused an harbour to be made at Seleucia, for the conveniency of Antioch. This was effected at an immense expence, the mouth of the Orontes, where the port was made, being full of fands and rocks. When the emperor Julian fet out on his expedition against the Persians, he made a long stay at Antioch; during which time, many of the Roman provinces were afflicted with a famine, but which raged more violently at Antioch than in other places. Antioch. The ecclefiastical writers of those times say, that this famine followed Julian from place to place; and as he continued longer at Antioch than any other city, it raged more violently there than anywhere elfe. To remedy this evil, Julian fixed the price of corn: by which means the famine was greatly increased, the merchants conveying their corn privately to other places, so that this metropolis was reduced to a most deplorable situation. In 381, in the reign of Theodosius the Great, Antioch was again vifited by a famine, accompanied by a grievous plague. The latter foon ceased: but, the famine still continuing, the bishop, Libanius, applied to Icarius, count of the East, requesting him by some means or other to relieve the poor, who had flocked from all parts to the metropolis, and were daily perishing in great numbers; but to this Icarius gave no other answer, than that they were abhorred and justly punished by the gods. This inhuman answer raised great disturbances; which, however, were terminated without bloodfied. In 387, Theodofius finding his exchequer quite drained, and being obliged to be at an extraordinary expense in celebrating the fifth year of the reign of his fon Arcadius, and the tenth of his own, an extraordinary tax was laid upon all the people in the empire. Most of the cities submitted willingly to this: but the people of Antioch, complaining of it as an unreasonable oppression, crowded to the house of Flavianus, their bithop, as foon as the edict was published, to implore his protection. Being unable to find him, they returned to the forum; and would have torn the governor in pieces, had not the officers who attended him kept back with great difficulty the enraged multitude, till he made his escape. Upon this, they broke some of the emperor's flatues, and dragged others through the city, uttering the most injurious and abusive exprestions against him and his whole family. They were, however dispersed by a body of archers, who, by wounding only two of the rabble, struck terror into all the reft. The governor proceeded against the offenders with the utmost crucky; exposing some to wild beasts in the theatre, and burning others alive. He did not spare even the children, who had infulted the emperor's flatues; and caused several persons to be executed, who had been only spectators of the disorder. In the mean time a report was spread, that a body of troops was at hand, with orders to plunder the city, and put all to the fword, without diffinction of fex or age; upon which the citizens abandoned their dwellings in the utmost terror and confusion, retiring to the neighbouring mountains with their wives and families. As the report proved groundless, some of them returned; but the greater part dreading the cruelty of the governor, and the displeasure of the emperor, continued in their retreats. To those who returned, St Chrysostom preached some homilies, which have reached our times, and are greatly admired; and which are faid by St Chryfollom himself, as well as some cotemporary writers, to have had a confiderable effect in reforming the lives of this licentious and dissolute people. On hearing the

news of this tumult, Theodofius was fo much enraged,

that he commanded the city to be destroyed, and its in-

habitants to be put to the fword without distinction;

but this order was revoked before it could be put into execution, and he contented himfelf with a punishment He appointed judges to punish the offenders; who pro- Antioch. ceeded with fuch feverity, and condemned fuch numbers, that the city was thrown into the utmost consternation. On this occasion, St Chrysostom and the hermits, who were very numerous in the neighbourhood, exerted all their eloquence in behalf of the unhappy people, and obtained a respite for those who had been condemned. They next proceeded to draw up a memorial to the emperor in favour of the citizens in general; and being joined by Flavianus, at last obtained a general pardon, and had the city reflored to all its former privileges.

In the year 458, Antioch was almost entirely ruined by an earthquake, which happened on the 14th of September; scarce a single house being left slanding in the most beautiful quarter of the city. The like misfortune it experienced in 525, during the reign of the emperor Justin; and 15 years after, being taken by Cosrhoes king of Persia, that infulting and haughty monarch gave it up to his foldiers, who put all they met to the The king himfelf feized on all the gold and filver veffels belonging to the great church; and caused all the valuable statues, pictures, &c. to be taken down and conveyed to Perha, while his foldiers carried off every thing elfe. The city being thus completely please dered, Colrhoes ordered his men to fet fire to it; which was accordingly done to effectually, that none of the buildings even without the walls escaped. Such of the inhabitants as escaped slaughter were carried into Perfia, and fold as flaves.

Notwithflanding fo many and fo great calamities, the city of Antioch foon recovered its wonted iples dour; but in a short time underwent its usual fate, being almost entirely destroyed by an earthquake in 587, by which 30,000 persons lost their lives. In 634, it fell into the hands of the Saracens, who kept possession of at tall the year 858, when it was surprised by one Burtzas, and again annexed to the Roman empire. The Romans continued masters of it for some time, till the civil disfentions in the empire gave the Turks an opportunity of feizing upon it as well as the whole kingdom of Synn. From them it was again taken by the Cruraders in 1098. In 1262, it was again taken by Bibaris fultan of Egypt, who put a final period to its glory.

Antioch is now no more than a ruinous town, whose houses, built with mud and itraw, and narrow and may flreets, exhibit every appearance of mifery and wretel.edness. These houses are situated on the southern bank of the Orontes, at the extremity of an old decay. ed bridge: they are covered to the fouth by a mountain; upon the flope of which is a wall, built by the Crufaders. The distance between the present town and this mountain may be about 400 yards, which space is occupied by gardens and heaps of rubbith, but prefents nothing interesting.

Notwithstanding the unpolished manners of its inbabitants, Antioch was better calculated than Aleppo to be the emporium of the Europeans. By clearing the mouth of the Orontes, which is fix leagues lower down, boats might have been towed up that river, though they could not have failed up, as Pococke has afferted; its current is too rapid. The natives, who never knew the name Orontes, call it, on account of the fwiftness of its stream, El-anfi, that is, the rebel. Its breadth, at Antioch, is about forty paces. lengues

similar to that inflicted by Severus above-mentioned. Vol. II. Part I.

i chetta

leagues above that town it passes by a lake abounding in fish, and especially in eels. A great quanti-Antiochian ty of these are falted every year, but not sufficient for the numerous falls of the Greek Christians. It is to be remembered, we no longer hear at Antioch, either of the Grove, or Daphne, or of the voluptuous fcenes of which it was the theatre.

> The plain of Antioch, though the foil of it is excellent, is uncultivated, and abandoned to the Turcomans; but the hills on the fide of the Orontes, particularly opposite Serkin, abound in plantations of figs and olives, vines, and mulberry trees, which, a thing uncommon in Turkey, are planted in quincunx, and exhibit a landscape worthy our finest provinces.

> Seleucus Nicator, who founded Antioch, built also at the mouth of the Orontes, on the northern bank, a Large and well fortified city, which bore his name, but of which at prefent not a fingle habitation remains; nothing is to be feen but heaps of rubbish, and works in the adjacent rock, which prove that this was once a place of very confiderable importance. In the fea also may be perceived the traces of two piers, which are indications of an ancient port, now choked up. The inhabitants of the country go thither to fifh, and call the name of the place Souaidia.

> ANTIOCHETTA, a town of Turkey in Afia, in Caramania, with a bishop's see, over against the island of Cyprus. F. Long. 32. 15. N. Lat. 36. 42.

ANTIOCHIA (anc. geog.), a town of Affyria, fituated between the rivers Tigris and Tornadotus (Pliny) .- Another of Caria, on the Meander; called also Pythopolis, Athymbra, and Nyssa, or Nyssa (Stephanus): but Strabo says, that Nysa was near Tralles. -A third of Cilicia Trachea, on Mount Cragus (Ptolemy) .- A fourth, called Epidaphnes, the capital of Syria, diffinguished from cities of the fame name, either by its fituation on the Orontes, by which it was divided, or by its proximity to Daphne (See Antioch). -A fifth Antiochia, a town of Comagene, on the Euphrates (Piny) .-- A fixth, of Lydia Tralles, fo called (Pliny) .-- A feventh, of Margiana (Strabo, Pliny, Ptolemy), on the river Margus, taking its name from Antiochus, fon of Schuers, who rebuilt it, and walled it round, being before called Alexandria, from Alexander the founder, and furnamed Syria; in compals feventy fladia; whither Orodes carried the Romans, after the defeat of Crassis (Pliny) .- An eighth, in Melopotamia, on the lake Calirrhoe, the old name of Edeffa (Pliny).-A much Autiochia, on the river Mygdonius, in McCopotamia, fituated at the foot of Mount Mafius, and is the fame with Nilibis (Strabo, Plutarch). It was the bulwark and frontier town of the Romans against the Parthians and Persians, till given up to the Perfians, by Jovinian, by an ignominious peace (Aminian, Latropius) .- A tenth Antiochia, was that fituated in the north of Pilidia (Luke, Ptolemy, Strabo): it was a Roman colony, with the appellation, Cefarea. There is an Antiochia at Mount Taurus, mentioned by Ptolemy, but by no other au-

ANTIOCHIAN SECT or Academy, a name given to the fifth scademy, or branch of Academics. It took the denomination from its being founded by Antiochus, a philosopher contemporary with Cicero. - The Antiochian academy fucceeded the Philonian. As to joint

of doctrine, the philosophers of this sect appear to Antiochia have restored that of the ancient academy, except that in the article of the criterion of truth. Antiochus was really a Stoic, and only nominally an Academic.

ANTIOCHEAN Epocha, a method of computing time from the proclamation of liberty granted the city of Antioch about the time of the battle of Pharfalia.

ANTIOCHUS, the name of several kings of Sy-RIA. See that article.

-Antiochus of Ascalon, a celebrated philosopher, the disciple of Philo of Larissa, the master of Cicero, and the friend of Lucullus and Brutus. He was founder of a fifth academy: but, instead of attacking other fects, he fet himfelf down to reconcile them together, particularly the fect of the Stoics with that of the ancient academy.

ANTIOPE, in fabulous history, the wife of Licus, king of Thebes, who, being deflowered by Jupiter in the form of a fatyr, brought forth Amphion and Zethus.—Another Antiope was queen of the Amazons; and, with the affiltance of the Scythians, invaded the Athenians; but was vanquished by Theseus.

ANTIPÆDOBAPTISTS, (derived from arti, against, mus, maidos, child, and Bantiza, baptize, whence Burrierns), is a distinguishing denomination given to those who object to the baptism of infants; because they fay infants are incapable of being instructed, and of making that profession of faith which entitles them to this ordinance, and an admission into church communion. See ANABAPTISTS and BAPTISTS.

ANTIPAROS, an island in the Archipelago, oppolite to Paros, from which it is separated by a thait about feven miles over. It is the Olearos or Olimos, mentioned by Strabo, Plmy, Virgil, Ovid, &c.; and was, according to Heraelides Ponticus as quoted by Stephanus, first peopled by a Phoenician colony from Sidon.—According to Mr Tournefort's account, it is about 16 miles in circumference, produces a little wine and cotton, with as much corn as is necellary for the maintenance of 60 or 70 families, who live together in a village at one end of the island, and are mostly Maltele and French corlairs.

This island is remarkable for a subterraneous cavern or grotto, accounted one of the greatest natural curiofities in the world. It was first discovered in the last century by one Magni an Italian traveller, who has given us the following account: " Having been info med (fays he) by the natives of Paros, that in the little island of Antiparos, which lies about two miles from the former, of a gigantic statue that was to be feen at the mouth of a cavern in that place, it was refolved that we (the French conful and himself) should pay it a vifit. In pursuance of this resolution, after we had landed on the island, and walked about four miles through the midft of beautiful plains and floping woodlands, we at length came to a little hill, on the fide of which yawned a most horrid cavern, that with its gloom at first struck us with terror, and almost repressed curiofity. Recovering the first surprise, however, we entered boldly; and had not proceeded above 20 paces, when the supposed statue of the giant presented itself to our view. We quickly perceived, that what the ignorant natives had been terrified at as a giant, was nothing more than a sparry concretion, formed by the water dropping from the roof of the cave, and by degrees

hardening

Antiparos hardening into a figure that their fears had formed into a montler. Incited by this extraordinary appearance, we were induced to proceed still farther, in quest of new, adventures in this subterranean abode. As we proceeded, new wonders offered themselves: the spars, formed into trees and shrubs, presented a kind of petrified grove; fome white, fome green; and all receding in due perspective. They struck us with the more amazement, as we knew them to be mere productions of Nature, who, hitherto in folitude, had, in her playful moments, dreffed the scene as if for her own amusement.

> " But we had as yet feen but a few of the wonders of the place, and we were introduced as yet only into the portico of this amazing temple. In one corner of this half illuminated recess, there appeared an opening of about three feet wide, which feemed to lead to a place totally dark, and that one of the natives affured us contained nothing more than a refervoir of water. Upon this we tried, by throwing down some stones, which rumbling along the fides of the defcent for fome time, the found feemed at last quashed in a bed of wa-In order, however, to be more certain, we fent in a Levantine mariner, who, by the promife of a good reward, with a flambeau in his hand, ventured into this narrow aperture. After continuing within it for about a quarter of an hour, he returned, carrying some beautiful pieces of white spar in his hand, which art could neither imitate nor equal. Upon being informed by him that the place was full of those beautiful incrustations, I ventured in once more with him, for about 50 paces, anxiously and cautiously descending by a steep and dangerous way. Finding, however, that we came to a precipice which led into a spacious amphitheatre, if I may fo call it, still deeper than any other part, we returned; and being provided with a ladder, flambeaux, and other things, to expedite our defcent, our whole company, man by man, ventured into the same opening, and, descending one after another, we at last saw ourselves all together in the most magnificent part of the cavern.

> "Our candles being now all lighted up, and the whole place completely illuminated, never could the eye be prefented with a more glittering or a more magnificent feene. The roof all hung with folid icicles, transparent as glass, yet solid as marble. The eye could fearce reach the lofty and noble cieling; the fides were regularly formed with spars; and the whole presented the idea of a magnificent theatre, illuminated with an immense profusion of lights. The floor consisted of solid marble; and in feveral places, magnificent columns, thrones, altars, and other objects, appeared, as if nature had defigned to mock the curiofities of art. Our voices, upon speaking or finging, were redoubled to an aftonulling loudness; and, upon the firing of a gun, the noise and reverberations were almost deafening. In the midst of this grand amphitheatre rose a concretion of about 15 feet high, that, in some measure, resembled an altar; from which, taking the hint, we caused mass to be celebrated there. The beautiful columns that shot up round the altar, appeared like candlesticks; and many other natural objects represented the customary ornaments of this facrament.

> " Below even this spacious grotto, there seemed another cavern; down which I ventured with my former

mariner, and descended about 50 paces by means of a Anapara. rope. I at last arrived at a finall spot of level ground where the bottom appeared different from that of the amphitheatre, being composed of foft clay, violding to the preffure, and in which I thrust a stick to about fix feet deep. In this, however, as above, numbers of the most beautiful crystals were formed; one of which, particularly refembled a table. Upon our egrefs from this amazing cavern, we perceived a Greek infeription upon a rock at the mouth; but fo obliterated by time, that we could not read it. It feemed to import, that one Antipater, in the time of Alexander, had cone thither; but whether he penetrated into the depths of the cavern, he does not think fit to inform us.'

From this account Mr Tournefort's differs confiderably. Mr Migni mentions only one defcent or precipice from the entry of the cave to the grotto, or most magnificent part: Mr Tournefort fays that there were many very dangerous precipices and rugged ways, through which they were obliged to pass sometimes on their back, and fometimes on their belly; but gives no particular account of his journey till he comes to the grand cavern. This indeed he deferibes very pompoufly; but as by it he evidently wants to support a favourite hypothesis, namely, the vegetation of stones, perhaps the particulars are not altogether to be depented upon. He informs us, that, at the entry into the cavern, he met with a Greek infeription almost effaced, containing a good number of proper names; and that there was a tradition among the inhabitants, that there were the names of fome who had conspired against Alexander the Great, and having miffed their aim, had

taken refuge in this grotto.

The most particular account, however, of this famous grotto that hath hitherto been published, apprara ed in the British Magazine, in a letter fix ad Charl's Saunders, and dated Feb. 24. 1746-7; which, as t is very particular, and feems to bear fufficient marks of authenticity, we shall here infert. " Its entrance hes in the fide of a rock, about two miles from the feafhore; and is a spacious and very large arch, formed of rough craggy rocks, overhung with brambles and a great many climbing plants, that give it a gloominels which is very awful and agreeable. Our furgeon, myfelf, and four paffengers, attended by fix guides with lighted torches, entered this cavern about eight o'clock in the morning, in the middle of August last. We had not gone 20 yards in this cavity when we loft all light of day light: but our guides going before us with lights, we entered into a low narrow kind of alley, furrounded every way with stones all glittering like diamonds by the light of our torches; the whole being covered and lined throughout with small crystals, which gave a thousand various colours by their different reflections. This alley grows lower and narrower as one goes on, till at length one can scarce get along it. At the end of this passage we were each of us presented with a rope, to tie about our middles; which when we had done, our guides led us to the brink of a most horrible precipice. The descent into this was quite steep, and the place all dark and gloomy. We could fee nothing, in fhort, but some of our guides with torches in a miserable dark place, at a vast distance below us. The dreadful depth of this place, and the horror of the defeent thro' a miferable darkness into it,

Antiparos. made me look back to the lane of diamonds, if I may In call it, thro' which we had just passed; and I could not but think I was leaving heaven, to descend into the infernal regions. The hope of femething fine at my journey's end, tempted me, however, to trust myself to the rope and my guides at the top, to let myfelf down After about two minutes dangling in this pofture, not without much pain as well as terror, I found myself safe, however, at the bottom; and our friends all foon followed the example. When we had congratulated here with one another on our fafe defcent; I was inquiring where the grotto, as they called it, was. Our guides, shaking their heads, told us, we had a great way to that yet; and led us forward about 30 yards under a roof of ragged rocks, in a scene of terrible darkness, and at a vast depth from the furface of the earth, to the brink of another precipice much deeper and more terrible than the former. Two of the guides went down here with their torches first; and by their light we could fee, that this passage was not so perpendicular indeed as the other, but lay in a very steep slant, with a very slippery rock for the bottom; valt pieces of rough rugged rocks jutting out in many places on the right hand, in the descent, and forcing the guides fometimes to climb over, fometimes to creep under them, and fometimes to round them; and on the left, a thousand dark caverns, like so many monstrous wells, ready, if a foot should slip, to swallow them up for ever. We flood on the edge to fee thefe people with their lights descend before us; and were amazed and terrified to fee them continue descending till they feemed at a monstrous and most frightful depth. When they were at the bottom, however, they hollard to us; and we, trembling and quaking, began to descend after them. We had not gone 30 feet down, when we came to a place where the rock was perfectly perpendicular; and a vast cavern seemed to open its mouth to fwallow us up on one fide, while a wall of rugged rock threatened to tear us to pieces on the other. I was quite disheartened at this terrible prospect, and declared I would go back; but our guides affured us there was no danger; and the refl of the company refolving to fee the bottom now they were come fo far, I would not leave them: fo on we went to a corner where there was placed an old flippery and rotten ladder, which hung down close to the rock; and down this, one after another, we at length all descended. When we had got to the bottom of this we found ourselves at the entrance of another passage, which was terrible enough indeed; but in this there was not wanting fomething of beauty. This was a wide and gradual defcent; at the entrance of which one of our guides feat-ed himfelf on his breech, and began to flide down, telling us we must do the same. We could discover, by the light of his torch, that this passage was one of the noblest vaults in the world. It is about nine feet high, feven wide, and has for its bottom a fine green gloffy marble. The walls and arch of the roof of this being as fmooth and even in most places as if wrought by art, and made of a fine gliftering red and white granite, supported here and there with columns of a deep blood-red finning porphyry, made, with the reflection of the lights, an appearance not to be conceived. This pullage is at half 40 yards long; and of fo fteep a defeent, that one has enough to do, when feated on one's

breech, not to descend too quickly. Our guides, that we Antiparon. kept with us, could here keep on each fide of us: and, what with the prodigious grandeur and beauty of the place, our eafy travelling through it, and the diversion of our now and then running over one another whether we would or not; this was much the pleasantest part of our journey. When we had entered this passage, I imagined we should at the bottom join the two guides we had first set down: but alas! when we were got there we found ourselves only at the month of another precipice, down which we descended by a second ladder not much better than the former. I could have admired this place also, would my terror have suffered me; but the dread of falling, kept all my thoughts employed during my descent. I could not but observe, however, as my companions were coming down after. me, that the wall, if I may fo call it, which the ladder hung by, was one mass of blood-red marble, covered with white sprigs of rock crystal as long as my finger, and making, with the glow of the purple from behind, one continued immense sheet of amethysts. From the foot of this ladder we slided on our bellies through another shallow vault of polished green and white marble, about 20 feet: and at the bottom of this joined our guides. Here we all got together once again, and drank fome rum, to give us courage before we proceeded any farther. After this short refreshment, we proceeded by a strait, but somewhat slanting passage, of a rough, hard, and somewhat coarse stone, full of a thousand strange figures of snakes rolled round, and looking as if alive; but in reality as cold and hard as the rest of the stone, and nothing but some of the stone itself in that shape. We walked pretty easily along the descent for near 200 yards; where we saw two pillars feemingly made to support the roof from falling in: but in reality it was no fuch thing; for they were very brittle, and made of a fine glittering yellow marble. When we had passed these about 200 yards, we found ourselves at the brink of another very terrible precipice: but this our guides affured us was the last; and there being a very good ladder to go down by we readily ventured. At the bottom of this steep with a I may call it, we found ourselves for some way upon plain even ground; but, after about of yards walking, were presented by our guides with ropes again; which we faltened about our middles, though not to be fwung down by, but only for fear of danger, as there are lakes and deep waters all the way from hence on the left hand. With this caution, however, we entered the last alley: and horrible work it was indeed to get through it. All was perfectly horrid and difmal here. The fides and roof of the passage were all of black stone; and the rocks in our way were in some places so steep, that we were forced to lie all along on our backs, and flide down; and fo rough, that they cut our clothes, and bruifed us miferably in paffing. Over our heads, there were nothing but ragged black rocks, some of them looking as if they were every moment ready to fall in upon us; and, on our left hands, the light of our guides torches showed us continually the surfaces of dirty and. miferably looking lakes of water. If I had heartily repented of my expedition often before, here I affure you I was all in a cold fweat, and fairly gave myself over for loft; heartily curfing all the travellers that had written of this place, that they had described it so as

Antiparos, to tempt people to see it, and never told us of the horrors that lay in the way. In the midst of all these reflections, and in the very difmallest part of all the cavern, on a fudden we had loft four of our fix guides. What was my terror on this fight! The place was a thousand times darker and more terrible for want of their torches; and I expected no other but every moment to follow them into some of these lakes, into which I doubted not but they were fallen. The remaining two guides faid all they could indeed, to cheer us up; and told us we should see the other four again foon, and that we were near the end of our journey. I don't know what effect this might have upon the rest of my companions; but I assure you I believed no part of the speech but the last, which I expected every moment to find fulfilled in some pond or precipice. Our passage was by this time become very narrow, and we were obliged to crawl on all-fours over rugged rocks; when in an instant, and in the midst of these melancholy apprehensions, I heard a little hissing noise, and saw myfelf in utter, and not to be described, darkness. Our guides called indeed cheerfully to us, and told us that they had accidentally dropped their torches into a puddle of water, but we should soon come to the rest of them, and they would light them again; and told us there was no danger, and we had nothing to do but to crawl forward. I cannot fay but I was amazed at the courage of these people; who were in a place where, I thought, four of them had already perished, and from whence we could none of us ever escape; and determined to lie down and die where I was. Words cannot describe the horror, or the extreme darkness of the place. One of our guides, however, perceiving that I did not advance, came up to me, and clapping his hand firmly over my eyes, dragged me a few paces forward. While I was in this strange condition, expecting every moment death in a thousand shapes, and trembling to think what the guide meant by this rough proceeding, he lifted me at once over a great stone, set me down on my feet, and took his hand from before my eyes. What words can describe at that instant my astonishment and port! Inflead of darkness and despair, all was fpleadour and magnificence before me: our guides all appeared about us: the place was illuminated by 50 torches, and the guides all welcomed me into the grotto of Antiparos. The four that were first missing, I now found had only given us the flip, to get the torches lighted up before we came; and the other two had put out their lights on purpose, to make us enter out of utter darkness into this pavilion of splendour and glory. I am now come to the proper bufiness of this letter; which was to defembe this grotto. But I must confess to you that words cannot do it. The amazing beauties of the place, the eye that fees them only can con-The best account I can give you, however, ccive. pray accept of.

"The people told us, the depth of this place was 485 yards, the grotto, in which we now were, is a cavern of 120 yards wide, and 113 long, and seems about 60 yards high in most places. These measures differ something from the accounts travellers in general give us; but you may depend upon them as exact, for I took them with my own hand. Imagine then with yourfelf, an immense arch like this, almost all over lined with fine and bright crystallized white marble, and

illuminated with 50 torches; and you will then have Antiparos. fome faint idea of the place I had the pleafure to fpend three hours in. This, however, is but a faint description of its beauties. The roof, which is a fine vaulted arch, is hung all over with icicles of white shining marble, some of them ten feet long, and as thick as one's middle at the root; and among these hang a thousand feltoons of leaves and flowers, of the fame substance: but fo very glittering, that there is no bearing to look up at them. The fides of the arch are planted with feeming trees of the fame white marble, rifing in rows one above another, and often enclosing the points of the icicles. From these trees there are also hung festoons, tied as it were from one to another in vast quantities; and in some places among them there seem rivers of marble winding through them in a thousand meanders. All these things are only made, in a long course of years, from the dropping of water, but really look like trees and brooks turned to marble. The floor we trod upon was rough and uneven, with crystals of all colours growing irregularly out of it, red, blue, green, and some of a pale yellow. These were all shaped like pieces of saltpetre; but so hard, that they cut our shoes; among these, here and there, are placed icicles of the fame white shining marble with those above, and feeming to have fallen down from the roof and fixed there; only the big end of these is to the floor. To all these our guides had tied torches, two or three to a pillar, and kept continually beating them to make them burn bright. You may guess what a glare of splendour and beauty must be the effect of this illumination, among fuch rocks and columns of marble. All round the lower part of the fides of the arch are a thoufand white masses of marble, in the shape of oak trees. Mr Tournefort compares them to cauliflowers, but I should as soon compare them to toadstools. In short, they are large enough to enclose, in many places, apiece of ground big enough for a bedchamber. One of these chambers has a fair white curtain, whiter than fatin, of the same marble, stretched all over the front of it. In this we all cut our names, and the date of the year, as a great many people have done before us. In a course of years afterwards, the stone blusters out like this white marble over the letters. Mr Tournefort thinks the rock grows like oaks or apple trees for this reason; but I remember I saw some of the finest cockle and muscle shells, in the rock thereabouts, that ever I faw in my life. I wonder whether he thinks they grow there too. Besides, if this rock grows so fast, the cavern ought to be all grown up by this time; and yet, according to his measures and mine, the cavern feems on the other hand to be turned larger fince. Indeed, all that I can gather from his account of this glorious place is, that he had drank a bottle or two too much before he went down into'it."

ANTIPAS HEROD, OF HEROD-ANTIPAS, the fon of HEROD the Great, by one of his wives called Clospatra, a native of Jerusalem. Herod the Great, in his first will, appointed Antipas his successor in the kingdom; but afterwards, altering that will, he named his fon Archelaus his fucceffor, giving to Antipas the title only of Tetrarch of Galilee and Peræa.

Antipas took a great deal of pains in adorning and fortifying the principal places of his dominions. He married the daughter of Aretas king of Arabia; whom

Antipas he divorced about the year of Christ 33, to marry his Antipater. fister-in-law Herodias, wife to his brother Philip, who was still living. St John the Baptist exclaiming continually against this incest, was taken into custody by order of Antipas, and imprisoned in the castle of Machærus, (Mat. xiv. 3, 4. Mark i. 14. vi. 17, 18. Luke iii. 19, 20.) Josephus says, that Antipas caused St John to be laid hold of, because he drew too great a concourse of people after him; and that he was afraid left he should make use of the authority which he had acquired over the minds and affections of the people, to induce them to revolt. But the evangelifts, who were better informed than Josephus, as being eye-witnesses of what passed, and acquainted in a particular manner with St John and his disciples, affure us that the true reason of imprisoning St John was, the aversion which Herod and Herodias had conceived against him for the liberty he had used in censuring their scandalous marriage. The virtue and holiness of St John were fuch that even Herod feared and respected him; but his passion for Herodias had prevailed with him to have killed that prophet, had he not been restrained by his apprehensions of the people, who esteemed John the Baptist as a prophet. (Mat. xiv. 5, 6.) One day, however, while the king was celebrating the festival of his birth, with the principal persons of his court, the daughter of Herodias danced before him; and pleafed him fo well, that he promifed with an oath to give her whatever she should ask of him. By her mother's advice she asked the head of John the Baptist; upon which the king commanded John to be beheaded in prison, and the head to be given her .- Aretas, king of Arabia, to revenge the affront which Herod had offered to his daughter, declared war against him, and overcame him in a very obflinate engagement. Herod being afterwards detected as a party in Sejanus's conspiracy, was banished by the emperor Casus to Lyons in Gaul; whither Herodias accompanied him.

> This Antipas is the Herod who, being at Jerusalem at the time of our Saviour's passion (Luke xxiii. 11.), ridiculed him, by dreffing him in a white robe, and directing him to be conducted back to Pilate, as a mock king, whose ambition gave him no umbrage. The time when Antipas died is not known: however, it is certain he died in exile, as well as Herodias. Josephus fays, that he died in Spain, whither Caius upon his coming to Gaul, the first year of his banishment, might order him to be fent.

> ANTIPATER, the disciple of Aristotle, and one of Alexander the Great's generals, was a man of great abilities, and a lover of the ferences; but was accused of poisoning Alexander. He subdued the revolted Thracians, relieved Megalopolis, and overthrew the Spartans there. He died 321 years before the Christian era.

> ANTIPATER, an Idumean of illustrious birth, and possessed of great riches and abilities, taking advantage of the confusion into which the two brothers Hyrcanus and Aristobulus plunged Judea by their contest for the office of high prieft, took fuch measures as to gain Hyrcanus that office, and under his government to obtain the absolute direction of all affairs; while his great abilities and application to business made him so confiderable, that he was honoured as much as if he had been invelled with the royal authority in form:

but he was at last poisoned by a Jew, named Malachus, Antipater, 43 years before the Christian era. He left among his Antipathy. other children, the famous Herod king of the Jews.

ANTIPATER (Cælius), a Roman historian, who wrote a history of the Punic war, much valued by Cicero. The emperor Adrian preferred him to Salluit.

Antipater of Sidon, a Stoic philosopher, and likewife a poet, commended by Cicero and Seneca: he flourished about the 171st Olympiad. We have several

of his epigrams in the Anthologia.

ANTIPATHY, in physiology, is formed from the two Greek words zers contrary, and rates passion. Literally taken, the word fignifies incompatibility: but for the most part the term antipathy is not used to signify fuch incompatibilities as are merely physical; it is referved to express the aversion which an animated or fensitive being feels at the real or ideal presence of particular objects. In this point of view, which is the light in which we at prefent confider the term, antipathy, in common language, fignifies " a natural hor-" ror and deteflation, an insuperable hatred, an invo-" luntary aversion, which a sensitive being feels for some " other object, whatever it is, though the person who " feels this abhorrence is entirely ignorant of its cause, " and can by no means account for it." Such 18, they fay, the natural and reciprocal hostility between the salamander and the tortoife; between the toad and the weafel; or between sheep and wolves. Such is the invincible aversion of particular persons against cats, mice, fpiders, &c.; a prepossession which is sometimes so violent, as to make them faint at the fight of these animals. Of these and a thousand other antipathies the ancient naturalists, the schoolmen, and the vulgar, form fo many legends; and relate them as certain facts, that they may demand an explication of them from the philosophers. But these sages begin with investigating whether fuch antipathies actually exist or not.

To explore the matter without prejudice, we shall find it necessary to abstract from the subjects of this disquisition, 1. All such antipathies as are not ascertained; as that which is supposed to be felt by hens at the found of an harp, whose strings are made of a fox's bowels, between the falamander and tortoile, and between the weafel and the toad. Nothing is less confirmed, or rather nothing is more falle, than these facts, with which vulgar credulity and aftonishment are amused and actuated: and though some of these antipathies should be ascertained, this would be no proof that the animals which feel them are not acquainted with their causes, according to their mode and proportion of knowledge; in which case it will be no longer the antipathy which we have defined.

2. We must abstract those antipathies which can be extinguished or refumed at pleasure; those sictitious aversions, which certain persons feel, or pretend to feel, with affected airs, that they may appear more precise and finical, or fingularly and prodigiously elegant; that they may feem to have qualities fo exquifitely fine, as require to be treated with peculiar delicacy. One who bestows any attention on the subject, would be astonished to find how many of these chimerical averfions there are, which are pretended, and passed upon the world by those who affect them as natural and unconquerable.

3. When we abstract those aversions the causes of which

Autipathy, which are known and evident; we shall be surprised - after our deduction of these pretended antipathies from the general fum, how small, how inconsiderable, is the quantity of those which are conformable to our definition. Will any one pretend to call by the name of antipathy, those real, innate, and incontestible aversions which prevail between sheep and wolves? Their cause is obvious; the wolf devours the sheep, and subfists upon his victims; and every animal naturally flies with terror from pain or destruction; sheep ought therefore to regard wolves with horror, which for their nutrition tear and mangle the unrefifting prey. From principles fimilar to this, arifes that aversion which numbers of people feel against serpents; against small animals, such as reptiles in general, and the greatest number of infects. During the credulous and fusceptible period of infancy, pains have been taken to impress on our minds the frightful idea that they are venomous; that their bite is mortal; that their fling is dangerous, productive of tormenting inflammations or tumours, and fornctimes fatal: they have been represented to us as ugly and fordid; as being, for that reason, pernicious to those who touch them; as poisoning those who have the misfortune to swallow them. These horrible prepossessions are industriously inculcated from our infancy; they are fometimes attended and supported by difmal tales, which are greedily imbibed, and indelibly engraven on our memories. It has been taught us both by precept and example, when others at their approach have assumed in our view the appearance of detellation and even of terror, that we should fly from them, that we should not touch them. Is it then wonderful (if our false impressions as to this subject have been corrected neither by, future reflections nor experiments), that we should entertain, during our whole lives, an aversion for these objects, even when we have forgot the admonitions, the converfations, and examples, which have taught us to believe and apprehend them as noxious beings? and in proportion to the fentibility of our frame, in proportion as our nerves are irritable, our emotions at the fight of what we fear will be more violent, especially if they anticipate our expectation, and feize us unprepared, though our ideas of what we have to fear from them are the most confused and indistinct imaginable. To explain these facts, is it necessary to fly to the exploded subterfuge of occult qualities inherent in bodies, to latent relations productive of antipathies, of which no person could ever form an idea?

> It is often fufficient to influence a perfon who had formerly no aversion for an object, if he lives with some other affociate who gives himfelf up to fuch capricious panies; the habit is infenfibly contracted to be agitated with disagreeable emotions at the presence of an object which had been formerly beheld with indifference and cold blood. I was acquainted (fays the author of the article Antipathy in the French Encyclopédie) with a person of a very sound understanding, whom thunder and lightning by no means terrified; nay, to whom the spectacle appeared magnificent and the found majeffic: yet to a mind thus feemingly fortified against the infectious terror, no more was necessary than spending the summer with a friend in whom the appearance of lightning excited the strongest emotions, and whom the remotest clap of thunder affected with

extravagant paroxysms, to become timid in excess at Antipathy the approach of thunder; nor could be ever afterwards' furmount the fear which it inspired .- The frightful stories of dogs and cats, which have killed their masters, or which have given them mortal wounds, are more than sufficient to inspire a timorous person with averfion against these animals; and if the olfactory nerves of such a person be delicate, he will immediately discover the smell of them in a chamber: disturbed by the apprehension which these effluvia excite in his mind, he gives himself up to the most violent uneafiness, which is tranquillized when he is affured that the animal is no longer in the room. If by chance, in the fearch which is made to calm the uneafiness of this timorous perfon, one of these creatures should at last be discovered, every one prefently exclaims, A miracle: and admits the reality of antipathies into his creed; whilst all this is nothing but the effect of a childish fear, sounded on certain confused and exaggerated ideas of the hazard which one may run with thefe animals. The antipathy which some people entertain against cels, though they are eaten by others with pleafure, arifes from nothing but the fear of ferpents, to which these fishes are in some degree similar. There are likewise other antipathies which do not originate in the imagination, but arife from some natural incongruity; such as we often remark in children, for particular kinds of victuals, with which their tafte is not offended, but which their flomachs cannot digeft, and which are therefore difgorged as foon as fwallowed.

To what then are those antipathies, of which we have heard fo much, reducible? Either to legendary tales; or to aversions against objects which we believe dangerous; or to a childifu terror of imaginary perils; or to a difrelish, of which the cause is disguised; or to a ridiculous affectation of deheacy; or to an infirmity of the Romach; in a word, to a real or pretended reluctance for things which are either invested, or supposed to be invested, with qualities huitful to us. Too much care cannot be taken in preventing, or regulating, the antipathies of children; in familiar zing them with objects of every kind; in discovering to them, without emotion, such as are dangerous; in teaching them the means of defence and fecurity, or the methods of cicaping their noxious influence: and, when the rational powers are matured by age, in reflecting on the nature of those objects which we fear, in ascertaining what has been told concerning their qualities, or in vigoroully operating upon our own dispositions to overcome those vain repugnancies which we may feel. See SYM-PATHY, which is the opposite of Antipathy.

ANTIPATHY, in ethics, hatred, aversion, repugnancy. Hetred is entertained against persons; aversion, and amipathy, indifcriminately against persons or things: and repugnancy, against actions alone.

Hatred is more voluntary than aver from, antipathy, or repugnancy. These last have greater affinity with the animal constitution. The causes of ANTIPATHY are less known than those of aversion. Repugnancy is less permaneut than either the one or the other-We hate a vitious character, we feel averfion to its exertions; we are affected with ANTIPATHY for certain perfors at first fight; there are some affairs which we transact with repugnancy-Hatred columniates; averfion keeps us at a diffunce from certain perfons: ANTIPATHY makesAntipatris us deteff them; repugnancy hinders us from imitating

Antipodes.

ANTIPATRIS (Acts xxiii. 31.), a town of Paledine, anciently called Caphar Saba, according to Jofephus, but named Antipatris by Herod the Great, in honour of his father Antipater. It was fituated in a pleafant valley near the mountains, in the way from Jerufalem to Cæfarea. Jofephus places it at about the diffance of feventeen miles from Joppa.

ANTIPELARGIA, among the ancients, a law, whereby children are obliged to furnish necessaries to their aged parents. The ciconia, or stork, is a bird famous for the care it takes of its parents when grown old. Hence, in some Latin writers, this is rendered

lex ciconiaria, or the flork's law.

ANTIPHONARY, ANTIPHONARIUM, a fervice hook, which contained all the invitatories, responsories, collects, and whatever else was sung or said in the choir, except the lessons. This is otherwise called responsarium, from the responses therein contained. The author of the Roman antiphonary was Pope Gregory the Great. We also find mention of nocturnal and diurnal antiphonaries, for the use of the daily and nightly offices; summer and winter antiphonaries; also antiphonaries for country churches, &c. By the provincial constitutions of Archbishop Winchelsey, made at Merton, A. D. 1305, it is required that one of these should be sound in every church within the province of Canterbury. The use of these, and many other popish books, was forbid by the 3d and 4th of Edward VI.

ANTIPHONY, the answer made by one choir to another, when the pfalm or anthem is sung between

ANTIPHONY fometimes denotes a species of psalmody, wherein the congregation, being divided into two parts, repeat the psalms, verse for verse, alternately. In this sense, antiphony slands contradistinguished from symphony, where the whole congregation sings together.

Antiphony differs from responsorium, because in this latter the verse is only spoken by one person, whereas in the former, the verses are sung by the two choirs alternately. The original of Antiphonal singing in the western churches is referred to the time of St Ambrose, about the year 374. That father is said to have sirst introduced it into the church of Milan, in imitation of the custom of the eastern church, where it appears to be of greater antiquity, though as to the time of its institution, authors are not agreed; it was most probably introduced at Antioch, between the year of Christ 347 and 356.

Antiphony is also used to denote the words given out at the beginning of the psalm, to which both the choirs are to accommodate their singing.

ANTIPHONY, in a more modern fense, denotes a kind of composition made of several verses extracted out of different psalms, adapted to express the mystery solemnized on the occasion.

ANTIPODES, in geography, a name given to those inhabitants of the globe that live diametrically opposite to each other. The word is Greek, and compounded of arts, opposite, and aves, a foot; because their feet are opposite to each other.

The antipodes he under opposite meridians and op-

posite parallels; in the same degree of latitude, but of Antipolis opposite denominations, one being north and the other south. They have nearly the same degree of heat and Antiquaric cold, days and nights of equal length, but in opposite seasons. It is noon to one, when midnight to the other; and the longest day with the one, is the shortest with the other.

Plato is effected the first who thought it possible that the antipodes subsisted, and is looked upon as the inventor of the word. As this philosopher apprehended the earth to be spherical, he had only one step to make to conclude the existence of the antipodes.

The ancients, in general, treated this opinion with the highest contempt; never being able to conceive how men and trees could subfift suspended in the air with their feet upwards, for so they apprehended they

must be in the other hemisphere.

They never reflected that these terms appeards and downwards are merely relative; and signify only nearer to, or farther from, the centre of the earth, the common centre to which all heavy bodies gravitate; and that, therefore, our antipodes have not their feet upwards and head downwards any more than ourselves; because they, like us, have their feet nearer the centre of the earth, and their heads farther from it. To have the head downwards and feet upwards, is to place the body in a direction of gravity tending from the feet to the head; but this cannot be supposed with regard to the antipodes; for they, like us, tend toward the centre of the earth, in a direction from head to foot.

ANTIPOLIS (anc. geog.), now ANTIBIS, on the coast of Provence, a colony of the Massilians, tear the river Verus, in Gallia Narbonensis (Livy), three seagues to the west of Nice. E. Long. 7. Lat. 43. 40.

ANTIQUARE, among Roman lawyers, properly denotes the rejecting of a new law, or refuting to pais it. In which feufe, antiquating differs from alregating; as the latter imports the annulling an old law, the former the rejecting a new one.

Antiquage is also used for a law's growing obsolete, or into disuse, either by age or non-observance.

Antiquarii, a name given to copiers of old books. After the decline of learning amongst the Romans. and when many religious houses were erected, learning was chiefly in the hands of the clergy; the greatest number of whom were regulars, and lived in monasteries. In these houses were many industrious men who were continually employed in making new copies of old books, either for the use of the monastery or for their own emolument. These writing monks were diflinguished by the name of Antiquarii. They deprived the poor librarii, or common feriptores, of great part of their bufinels, so that these found it difficult to gain a fubfiltence for themselves and families. This put them upon finding out more expeditious methods of transcribing books. They formed the letters fmaller, and made use of more jugations and abbreviations than had been usual. They proceeded in this manner till the letters became exceedingly small; the abbreviations were very numerous, and extremely difficult to be read. This in fome measure accounts for the great variety of hands in the species of writing called Medern Gothic. When a number of copies were to be made of the same work, it was usual to employ several persons at the same time in writing it; each person,

except

Antiquary except him who wrote the first skin, began where his fellow was to leave off.

Antiquities

ANTIQUARY, a person who studies and searches after monuments and remains of antiquity; as old medals, books, statues, sculptures, and inscriptions; and, in general, all curious pieces that may afford any light into antiquity.

In the chief cities of Greece and Italy, there were persons of distinction called antiquaries, whose business it was to show strangers the antiquities of the place, to explain the ancient inscriptions, and to give them all the affishance they could in this way of learning.—Pausanias calls these antiquaries Eznyntae. The Sicilians call them myslogogi.

There was an ancient college of antiquaries erected in Ireland by Ollamh Fodhla, 700 years before Christ, for composing a history of that country: And to this, say the Irish historians, it is owing that the history and antiquities of that kingdom may be traced back

beyond those of most other nations.

There is a fociety of antiquaries in London, and another in Edinburgh, incorporated by the king's charter. See Society.

ANTIQUARY is also used by ancient writers for the keeper of the antiquarium or cabinet of antiquities. This officer is otherwise called archeota, or antiquary

of a king, a prince, a state, or the like.

Henry VIII. gave John Leland the title of his antiquary; a title which, fays the author of his life, nobody ever enjoyed besides himself. But the restriction, we suppose, was only intended to be understood in refpect of the kings of England. M. Schott, we find, had the title of antiquary to the king of Prussia; P. Pedruzzi, that of antiquary of the duke of Parma; M. Galland refided some time in Turkey under the title of antiquary of the king of France.-The university of Oxford have still their antiquary under the denomination of cuftos archivorum.—The kings of Sweden have been at great expences in order to illustrate the antiquity of their country, having established an academy of antiquaries with this fingle view .- The office of the ancient Irish antiquaries was to preserve the genealogies of the kings of Ireland, to correct the regal tables of succession, and deliver down the pedigree of every collateral branch of the royal family.

ANTIQUATED, fomething obsolete, out of date,

or out of use.

ANTIQUE, in a general fense, something that is ancient: but the term is chiefly used by sculptors, painters, and architects, to denote such pieces of their different arts as were made by the ancient Greeks and Romans. Thus we say, an antique bust, an antique state, &c.

ANTIQUE is fometimes contradiftinguished from ancient, which fignifies a less degree of antiquity. Thus, antique architecture is frequently distinguished from ancient architecture.

ANTIQUITIES, a term implying all testimonies, or authentic accounts, that have come down to us of ancient nations. Bacon calls antiquities the wrecks of history, or such particulars as industrious and learned persons have collected from genealogies, inscriptions, monuments, coins, names, etymologies, archives, instruments, fragments of history, &c.

Antiquities form a very extensive science, including Vol. II. Part I.

"an historical knowledge of the edifices, magistrates, Antiquities, offices, habiliments, manners, customs, ceremonics, worship, and other objects worthy of curiosity, of all

the principal ancient nations of the earth."

This science is not a matter of mere curiosity, but is indispensable to the theologian; who ought to be thoroughly acquainted with the antiquities of the Jews, to enable him properly to explain numberless passages in the Old and New Testaments: to the lawyer; who, without the knowledge of the antiquities of Greece and Rome, can never well understand and properly apply the greatest part of the Roman laws: to the physician and the philosopher, that they may have a complete knowledge of the history and principles of the physiciand philosophy of the ancients: to the critic, that he may be able to understand and interpret ancient authors: to the orator and poet; who will be thereby enabled to ornament their writings with numberless images, allusions, comparisons, &c.

Antiquities are divided into facred and profane, into public and private, univerfal and particular, &c. It is true, that the antiquaries (especially such as are infected with a spirit of pedantry, and the number of these is great) frequently carry their inquiries too far, and employ themselves in luborious researches after learned trifles; but the abuse of a science ought never to make us neglect the applying it to rational and useful pur-

pofes.

Many antiquaries also restrain their learned labours to the eclarressement of the antiquities of Greece and Rome: but this field is far too confined, and by ro means contains the whole of this science, seeing it properly includes the antiquities of the Jews, Egyptians, Persians, Phænicians, Carthaginians, Hetruscans, Germans, and, in general, all those principal nations mentioned in ancient history: so far as any accounts of them are come down to us.

If to the general subjects above mentioned we add the particular study of antiques, of the statues, bassreliefs, and the precious relicks of architecture, painting, camaieus, medals, &c. it is eafy to conceive that antiquities form a science very extensive and very complicated, and with which only a very fmall acquaintance could have been attainable by any one man, if our predecessors had not prepared the way for us; if they had not left us fuch ineffimable works as those of Grobovius, Gravius, Montfaucon, Count Caylus, Winckelman, the Hebraic antiquities of D. Iken of Bremen, the Grecian antiquities of Brunings, the Roman antiquities of Nieupoort, and especially that work which is entitled Bilingraphia Antiquaria Joh. Alberti Fabricii, professor at Hamburgh; &c. &c. Nor must we here forget that very valuable work, with which our countryman Mr Robert Wood has lately enriched this fcience, and which is fo well known, and fo justly effeemed by all true connoiffeurs, under the title of the Ruins of Palmyra, and those of Balber. It is by this work that we are fully convinced of the grandeur and magnificence, the tafte and elegance, of the buildings of the ancients. We here fee that the invention of these matters is not all owing to the Greeks, but that there were other nations who ferved them as models. For though many of the edifices of Palmyra are to be attributed to the emperor Aurelian, and to Odenatus and his wife Zenobia, who reigned there about the year

Antiquities 264, yet there are found at the same place ruins of buildings that appear to be of far greater antiquity, and that are not less beautiful. The ancient Persepolis is sufficient to prove this affertion. When we duly reflect on all these matters, and especially if we attempt to acquire any knowledge of this science, we shall soon be convinced that it but ill becomes a petit-

maitre to laugh at a learned antiquary.

The knowledge of those monuments of the ancients, the works of sculpture, statuary, graving, painting, &c. which they call antiques, requires a first attention with regard to the matter itself on which the art has been exercised; as the wax, clay, wood, ivory, stones of every kind, marble, flint, bronze, and every fort of metal. We should begin by learning on what matter each ancient nation principally worked, and in which of the fine arts they excelled: For the matter itself, as the different forts of marble, compositions of metals, and the species of precious stones, serve frequently to characterize the true antique, and to difcover the counterfeit. The connoisseurs pretend also to know, by certain diffinct characters in the defign and execution of a work of art, the age and nation where it was made. They find, moreover, in the invention and execution, a degree of excellence which modern artists are not able to imitate. Now, though we ought to allow, in general, the great merit of the ancients in the polite arts, we should not, however, fuffer our admiration to lead us into a blind superstition. There are pieces of antiquity of every fort, which have come down to us; fome that are perfectly excellent; and others fo wretched, that the meanest among modern artists would not acknowledge them. The mixture of the good and bad has taken place in all subjects, at all times, and in all nations. The misfortune is, that most of our great antiquaries have been so little skilled in designing as scarcely to know how to draw a circle with a pair of compasses. It is prejudice, therefore, which frequently directs them to give the palm to the ancients, rather than a judgment directed by a knowledge of the art. That character of expression which they find so marvellous in the works of antiquity, is often nothing more than a mere chimera. They pretend that the artists of our days conflantly exaggerate their expressions; that a modern Bacchus has the appearance of a man distracted with intoxication; that a Mercury feems to be animated with the spirit of a fury; and so of the rest. But let them not decide too hastily. Almost all the antique figures are totally void of all spirit of expression; we are forced to guess at their characters. Every artisieial expression requires, moreover, to be somewhat exaggerated. A statue or portrait is an inanimate figure; and must therefore have a very different effect from one which, being endowed with life, has the muscles constantly in play, and where the continual change of the features, the motion of the eyes, and the looks more or less lively, easily and clearly express the passions and sentiments. Whereas, in a figure, that is the produce of art, the delicate touches, that should express the passions, are lost to the eyes of the spectatois: they must therefore be struck by strong, bold characters, which can affect them at the first glance of the eye. A very moderate artist is sensible, at the

fame time, that he is not to give his figures extravagant Antiquity expressions, nor to place them in distorted attitudes.

ANTIQUITY fignifies times or ages past long ago. Antiseptice. Thus, we fay, the heroes of antiquity, &c.

Antiquity is also used to denote the works or monuments of antiquity. See Antiquities.

Antiquity likewise expresses the great age of a thing; and in this sense we say, the antiquity of a fa-

mily, the antiquity of a kingdom.

ANTIRRHINUM, SNAP DRAGON, OF CALVES SNOUT: A genus of the angiospermia order, belonging to the didynamia class of plants; and in the natural method ranking under the 40th order, Personate. The effential characters are thefe: The calyx confits of five leaves; the basis of the corolla is bent backwards, and furnished with nectaria; the capfule is bilocular. There are 14 species of the antirrhinum, 10 of which are natives of Britain; viz. the cymbalaria, or ivy-leaved toad grass; the elatine, or sharp pointed flucllin; the fpurium, or round leaved fluellin; the arvenfe, or corn blue toad flax; the repens, or creeping toad flax; the monospermum, or sweet smelling toad flax; the linaria, or common yellow toad flax; the minus, or least toad flax; the majus, or greater suapdragon; and the orontium, or least fnap dragon. The linaria is faid to be cathartic and diuretic; but it is not used in the shops.

ANTIRRHIUM (anc. geog.), a promontory at the mouth of the Corinthian bay, where it is scarce a mile broad, and where it separates the Ætolians from the Peloponnefus; so called from its opposite situation to Rhium in Peloponnesus (Pliny): both are now called the Dardanelles of Lepanto.

ANTISABBATARIANS, a modern religious sect, who oppose the observance of the Christian fabbath. The great principle of the Antifabbatarians is, that the Jewish sabbath was only of ceremonial, not moral obligation; and confequently is abolished by the coming of Christ.

ANTISAGOGE, in rhetoric, a figure differing little from that called concession. The following passage from Cicero is an instance of it : Difficilis ratio belli gerendi; at plena fidei, plena pietatis: et si dicas, magnus labor, multa pericula proponuntur; at gloria ex his immortalis est consecutura. See Concession.

ANTISCII, in geography, people who live on different fides of the equator, whose shadows at noon are projected opposite ways. Thus the people of the north are Antifcii to those of the fouth; the one projecting their shadows at noon toward the north pole, and the other toward the fouth pole.

ANTISCORBUTICS, medicines good in fcorbutic cases.

ANTISEPTICS (from arri and onaros putrid, of ourse to putrify), an appellation given to fuch substances as refift putrefaction.

We have some curious experiments in relation to antiseptic substances by Dr Pringle, who has ascertained their several virtues. Thus, in order to settle the antiseptic virtue of falts, he compared it with that of common fea falt; which being one of the weakest, he supposes equal to unity, and expresses the proportional strength of the rest by higher numbers, as in the following table.

Antiseptics, Antispafmodics. Salts, their antiseptic virtue.

Sea falt Saline mixture 3 Sal gemme Nitre 1+ 4+ Salt of hartshorn Tartar vitriolated 2 Spiritus Mindereri Salt of wormwood 2 Tartarus solubilis Borax 12+ Sal diurctious Salt of amber 20+ Crude fal ammoniac Alum 30+ 3

In this table the proportions are marked in integral numbers: only to some there is added the fign +, to show, that those salts are possessed of a stronger anti-septic virtue than the number in the table expresses, by some fractions: unless in the three last, where the same sign imports that the salt may be stronger by some units.

Some refinous and other fubflances even exceed the antifeptic virtues of the neutral falts; thus myrrh, afafætida, terra japonica, and aloes, are at least 12 times more antifeptic than sea falt. Two grains of camphor are equivalent to 60 grains of that sait. An infution of a few grains of Virginian snake-root, in powder, exceeds 12 times its weight of sea salt. Camomile slowers have nearly the same extraordinary quality. The Jesuits bark has it also. Besides these, pepper, ginger, saffron, contrayerva root, are 12 times more antiseptic than sea salt. Dried sage, rhubarb, the root of the wild valerian, mint, angelica, ground isy, senna, green tea, red roses, wormwood, mustard, and horse radish, were likewise found more antiseptic than the standard.

To the class of antiseptic medicine may likewise be added fermented liquors, acids, spirt, and even those plants called anti-acids, and erroneously supposed hasteners of putresaction, particularly horse radish. Now vegetables, possessing this virtue, are the more valuable, in that being usually free of acrimony, they may be taken in much greater quantities than either spirits, acids, resins, or even the neutral salts.

Antifeptics are preferibed in all putrid, malignant, and peftilential cases. It is to be remarked, however, that different kinds of them are to be given in different diseases, and even in different stages of the same disease. Thus, the bark is a specific in a gangrene, when the vessels are relaxed, and the blood resolved or disposed to putrefaction; but will fail, if the vessels are too full, or the blood be too takes. With the same caution is the bark to be used in wounds, viz. chiefly in cases of absorbed matter, when it insects the humours, and brings on a hestic fever.

By the great antiseptic virtue of alum, the bark, and other astringents, it should seem, that astriction had no small share in the cure of putrid disorders; and, indeed, the very nature of putrefaction consists in a separation or disunion of the parts. But as astringents are improper to be administered in many cases, contraverva root, snake root, camphor, &c. may supply their place; which, though highly antiseptic, have very little, or any, of an astringent quality.

ANTISPASMODICS, are medicines proper for the cure of fpasms and convulsions. Opium, balsam of Peru, and the essential oils of mary vegetables, are the principal in this class of medicines. Opium excels, for its immediate effects. Peruvian balsam, in many instances, produces more lasting benefit than opi-

um, and fometimes succeeds where opium fails. As Antifass autitpasmodics, the effential oils differ in this from opium, that they act more on a particular part than on the system in general, and have no soporisic effect. Some medicines remove spasms by immediate contact, as assess milk, cream, oil of almonds; others by repelling heat, as gas, sulphur, nitre, sal ammoniac, &c. And where the strictures are produced by inantition and a defect of vital heat, spasms are removed by those medicines that restore the vis vite, such as valerian, castor, musk, &c.

ANTISTASIS, in oratory, a defence of an action from the confideration that had it been omitted worse would have ensued. This is called by Latin writers comparativum argumentum; such, e. g. would be the general's describe who had made an inglorious capitulation, That, without it, the whole army must have perished.

ANTISTHENES, a Greek philosopher, and founder of the Cynics. He was born at Athens, and paffed the former part of his life as a foldier: Having after wards been an attendant at the lectures of Socrates, he was principally charmed with those exhortations of that great philosopher, which persuaded to frugality, to temperance, and to moderation; these Antisthenes was refolved to practice by carrying every precept to its utmost extent. Permitting therefore his beard to grow, he went about the streets in a thread-bare coat, scarcely to be diffinguished from a common beggar. He prided himself upon the most rigid virtue, and thought himself obliged to attack the vicious wherever he found them. This gave him fome reputation in the city; but it may be supposed, that, in a place so very luxurious as Athens, he had more enemies than disciples. His philosophy confisted rather in action than speculation: it was therefore his constant maxim, That to be virtuous was to be happy, and that all virtue confifted in action; that the wife man should live for himself, contented in all fituations, and happy alone in the confciousnels of his own virtue. He acknowledged nothing to be good but what was honourable; and afferted, that virtue might be acquired by practice. Lacrtius tells us there were 10 tomes of his works; and he has given us many of his apophthegins.

ANTISTOECHON, in grammar, the using one letter instead of another; as olli for illi.

ANTISTROPHE, in grammar, a figure by which two things mutually depending on one another, are reciprocally converted; as, the fervant of the mafter, the mafter of the fervant.

ANTISTROPHE, among lyric poets, that part of a fong and dance in use among the ancients, which was performed before the altar, in returning from west to east; in opposition to strophe. See STROPHE and ODD.

ANTITACTÆ, in church history, a branch of Gnostics, who held, that God was good and just, but that a creature had created evil; and consequently that it is our duty to oppose this author of evil, in order to avenge God of his adversary.

ANTITHENAR, in anatomy, a name given to the adductor indicis. See Anatomy, Table of the Muscles.

ANTITHESIS, in rhetoric, a contrast or opposition of words or fentiments. Such is that of Cicero, in the second Catilinarian: "On one side stands moAntithesis desty, on the other impudence; on one sidelity, on the other deceit; here piety, there facrilege: here continency, there lust, &c." Such also is that of Augustus to some seditions young men, Audite, juvenes, fenen, quem juvenem seus audivere. Such again is that of Seneca: Curry leaves locameter, inventes stubent. And

of Seneca: Cura lawes loquuntur, ingentes stupent. And that of Virgil:

Flectere si nequeo superos, Acheronta movebo.

St Augustine, Seneca, Salvian, and many other ancient writers, seem greatly to affect antithesis; but among the moderns they are generally decried. Definanctz represents them as the savourites of young writers. The following is an example of modern antithesis:

Though gentle, yet not dull; Strong, without rage; without o'erflowing, full.

Antithesis is fometimes used for controversy. In this tense, we meet with antichetic method, antichetic discourses, &c. Marcion composed a volume of Antitheses, or contraricties and oppositions between the law and the gospel.

ANTITRAGUS MUSCULUS, in anatomy, a muscle of the ear. Sec Anatomy, Table of the Muscles.

ANTITRINITARIANS, those who deny the trinity, and teach that there are not three persons in the Godhead. Thus the Samosatenians who do not believe the distinction of persons in God; the Arians, who deny the divinity of the Word, and the Macedonians who deny that of the Holy Spirit, are all properly Antitrinitarians. Among the moderns, Antitrinitarians are particularly understood of Socinians, called also Unitarians.

The Bibliocheco Antirinitariorum, or Antirinitarian Library, is a pollhumous work of Christopher Sandius, an eminent Antirinitarian; wherein he gives a lift, digethed in order of time, of all the Sociman or modern Antirinitarian authors, with a brief account of their lives, and a catalogue of their works. See Unitarian.

ANTITYPE, a Greek word, properly fignifying a type or figure corresponding to some other type.

The word antity pe occurs twice in the New Teffament; viz. in the epidle to the Hebrews, ix. 24. and to St Peter, 1 Eph. iii. 21. where its genuine import has been mach controverted. The former fays, that · Christ is not entered into the holy places made with hands, which are, artituta, the figures or antitypes of the true-now to appear in the presence of God for us." Now 70706 figuifies the pattern by which another thing is made; and as Mofes was obliged to make the tubernacle, and all things in it, according to the pattern shown him in the mount; the tabeinacle fo formed was the antitype of what was flown so Mofes: any thing, therefore, formed accordingato a model or pattern, is an antitype. In the litter passege, the apostle speaking of Noah's slood, and thedeliverance only of eight persons in the ark from it fays, Ω και ημας αντιτυπον νυνσωζει βαπτισμα, Βαρtipm being an autitype to that, now faves us; not putting away the filth of the flesh, but the answer of a good con-ference towards God, &c. The meaning is, that rightroulnels, or the univer of a good conference towards God, now faver us by means of the refurrection of Christ, as formerly righteousness saved these eight per-Antippe sons by means of the ark, during the slood. The word antitype, therefore, here signifies a general similitude Antonia. of circumstances; and the particle a, whereunto, refers, not to the immediate antecedent, whate, water, but to all that precedes.

ANTITYPE, among the ancient Greek fathers, and in the Greek liturgy, is also applied to the symbols of bread and wine in the sacrament. Hence it hath been argued, by many Protestants, that the Greeks do not really believe the doctrine of transubstantiation; because they call the bread and wine antitypes, arrivara, q. d. figures, similitudes; and this even after the confecration.

ANTIUM (anc. geog.), a city of the Volsci, (Livy); situated on the Tuscan sca, yet without a harbour, because they had a neighbouring hamlet, called Ceno, with a Karbour, (Strabo). The Romans gained their first reputation in naval affairs against the Antiates; part of whose ships they conveyed into the arsenal of Rome, and part they burnt; and with their beaks or rostra adorned the pulpit crected in the forum, thence called Rostra, (Livy, Florus.) Here stood a a famous temple of Fortune, (Horace). Addison says, there were two Fortunæ worshipped at Antium.—It is now extinct, but the name still remains in the Capo d'Anzo.

ANTIVARI, a strong town of Turkey in Europe, "in Dalmatia, a Greek archbishop's see, and subject to the Turks. E. I.on. 29. 15. N. Lat. 43. 0.

ANTLER, among sportsmen, a start or branch as a deer's attire.

Brow-Angier, denotes the branch next the lead; and,

BES-ANTLEE, the branch-next above the brow-antler.

ANTLIA, an ancient machine, supposed to be the same with our pump. Hence the phrase in antham condemnari, according to the critics, denotes a kind of punishment whereby criminals were condemned to drain ponds, ditches, or the like.

ANTOEICI, in geography, those inhabitants of the carth who live under the same meridian, and at the same distance from the equator; the one toward the north, and the other ward the south. Hence they have the same longitude, and their latitude is also the same, but of a different enomination. They are in the same semicircle of the meridian, but opposite in parallels. They have precisely the same hours of the day and night, but opposite seasons; and the night of the one is always equal to the day of the other.

ANTOINE, a town of France, in Dauphiny, in the diocefe of Vienne, with a celebrated abbey. It is feated among the mountains, 13 miles east of Lyons. E. Lon. 5. 20. N. Lat. 45. 43.

ANTONA, (Tacitus); a river of Britain, which Camden supposes to be a faulty reading for Avuona or Ausona, (the Avon).

ANTONACUM, ANTONNACUM, Or ANTUNNA CUM, a town of the Treveri; now Andernach, below Coblentz. E. Lon. 7. 5. Lat. 50. 25.

ANTONIA, a citadel of Jerusalem, the origin of which we have in Josephus; who says, that Hircanus, the shill high-priest of that name, built Baris near the temple, a house with turrets, where he generally resided.

Antonia fided. Herod afterwards made it stronger, for the security and defence of the temple; and in honour of Antonides. Marc Antony, who then commanded in the east, called it Antonia. It was very extensive, and could accommodate a Roman legion: from it there was a full view of the temple.

> ANTONIA (St), a town of France, in Rouergue, in the diocefe of Rhodez, whose fortifications are demolished. It is seated on the river Aveiron. E. Long.

> O. 55. N. Lat. 44. 10.
> ANTONIAN WATERS, medicinal waters of Germany, very pleafant to the tafte, and effected good in many chronic and hypochondriac cases. See Tons-TEIN.

> ANTONIANO (Silvio), a man of great learning, who raifed hunfelf from a low condition by his merit, was born at Rome in the year 1540. When he was but ten years old, he could make veries upon any fubiect proposed to him; and these so excellent, though pronounced extempore, that even a man of genius could not compose the like without a good deal of time and pains. The duke of Ferrara coming to Rome, to congratulate Marcellus II. upon his being raifed to the pontificate, was fo charmed with the genius of Antoniano, that he carried him to Ferrara, where he provided able malters to instruct him in all the sciences. From thence he was fent for by Pius IV. who made him professor of the belles lettres in the college at Rome. Antoniano filled this place with fo much reputation, that, on the day when he began to explain the oration pro Marco Marhe had a vaft crowd of auditors, and among thefe ne les than 25 cardinals. He was afterwards chosen rector of the college; and after the death of Pius IV. being feized with a fpirit of devotion, he joined himfelf to Philip Neri, and accepted the office of fecretary to the facred college, offered him by Pius V. which he executed for 25 years with the reputation of an honest and able man. He retufed a bithopric which Grego-IV XIV. would have given him; but he accepted the office of fecretary to the briefs, offered him by Clement VIII. who made him his chamberlain, and after-Antoniano killed himfelf by too wards a cardinal. great fatigue: for he fpent whole nights in writing letters; which brought on a fickness, whereof he died, in the 63d year of his age. He te with fuch eafe, and flucing, that he never almost made any blot or rafure; and it is faid of him, that he preferred the flower of his virginity during his whole life.

> ANTONIDES VANDER GOES (John), an eminent Dutch poet, born at Goes in Zealand, the 3d of April 1647. His parents were Anabaptifts, people of good character, but of low circumstances. They went to live at Amilerdam when Antonides was about four years old; and, in the ninth year of his age, he began his fludies, under the direction of Hadrian Junius and James Coccerus. Antonides took great pleafure in reading the Latin poets, and carefully compared them with Grotius, Heinfius, &c. By this means he acquired a tafte for poetry, and enriched his mind with noble ideas. He first attempted to translate some pieces of Ovid, Horace, and other ancients; and, having formed his talte on these excellent models, he at length undertook one of the most difficult talks in poetry, to write a tragedy: this was entitled Trazil, or The invafion of China. Antonides, however, was fo modest, as not to permit it to

be published. Vondel, who was then engaged in a dra- Antonides matic piece, which was taken also from some event that happened in China, read Antonides's tragedy; and was Antoninus so well pleased with it, that he declared, if the author would not print it, he would take some passages out of it, and make use of them in his own tragedy. He accordingly did fo; and it was reckoned much to the honour of Antonides, to have written what might be adopted by fo great a poet as Vondel was acknowledged to be by all good judges. Upon the conclusion of the peace between Great Britain and Holland, in the year 1674, Antonides wrote a piece, entitled Bellona aan band, i. e. "Bellona chained;" a very elegant poem, confifting of feveral hundred verfes. He next wrote an ingenious heroic poem, which he entitled The River 2

(the river on which Amsterdam is built).

Antonides's parents had bred him up an apothecary: but his remarkable genius for poetry foon gained him the effect and friendship of several persons of diffinetion; and particularly of Mr Buifero, one of the lords of the admiralty at Amilerdam, and a great lover of poetry, who fent him at his expence to purfue his fludies at Leyden, where he remained till he took his degree of doctor of physic, and then his patron gave him a place in the admiralty. In 1678, Antonides married Sufanna Bermans, a minister's daughter, who had also a talent for poetry. His marriage was celebrated by feveral emment poets, particularly by the famous Peter Francius, professor of eloquence, who composed fome Latin verses on the occasion. After marriage, he did not much includge his poetic genius; and within a few years he fell into a confumption, of which he died on the 18th September 1684, being then but thirty. feven years and a few months old. He is effeemed the moil eminent Dutch poet after Vondel. His works have been printed feveral times, having been collected by Father Anthony Tanfz. The last edition was printed by Nicholas Ten Hoom, at Amileidam, in the year 1714, in 4to, under the direction of David Van Hoogitraaten, one of the mafters of the Latin school of thit city, who added to it also the life of the poet.

ANTONINUS Pius, the Roman emperor, was born at Lanuxum in Italy, A. C. 86, of a family originally from Nifmes in Languedoc. His character was in all respects one of the noblest that can be imagined; and he had the title of Pius given him by the fenate. We have no regular account of the transactions of his reiga, fince Capitolinus has written in a very confused manner; and we have only an abridgment of Dion Caffius's hittory by Xiphilin now remaining. He managed the public revenues with great frugality, yet was extremely generous; was fond of peace, and in war preferred the reputation of judice to all the advantages which might be gained by victory. He was more intent upon preserving the bounds of his empire than extending them; and he often made use of Scipio's expression, That he chose rather to fave one citizen than kill a thousand enemies. By this conduct he made himfelf univerfally effectived and revered in that age, and admired by posterity. This great and good emperor died in 161, aged 75 years, having reigned 23.

ANTONINUS PHILOSOPHUS (Marcus Aurclius). the Roman emperor, born at Rome, the 26th of April, in the 121st year of the Christian era. He was called by faveral names till he was admitted into the AureAntoninus lian family, when he took that of Marcus Aurelius Antoninus. Hadrian, upon the death of Cejonius Commodus, turned his eyes upon Marcus Aurelius; but, as he was not then 18 years of age, and consequently too young for so important a flation, he fixed upon Antoninus Pius, whom he adopted, upon condition that he should likewise adopt Marcus Aurelius. The year after this adoption, Hadrian appointed him questor, though he had not yet attained the age prescribed by the laws. After the death of Hadrian, Aurelius married Faustina, the daughter of Antoninus Pius, by whom he had several children. In the year 139, he was invested with new honours by the emperor Pius, in which he behaved in such a manner as endeared him to that prince and the whole people.

Upon the death of Pius, which happened in the year 161, he was obliged by the fenate to take upon him the government; in the management of which he took Lucius Verus as his colleague. Dion Cassius says, that the reason of doing this was, that he might have leifure to purfue his studies, and on account of his ill state of health; Lucius being of a strong vigorous constitution, and confequently more fit for the fatigues of war. The fame day he took upon him the name of Antoninus, which he gave likewise to Verus his colleague, and betrothed his daughter Lucilla to him. The two emperors went afterwards to the camp; where, after having performed the funeral rites of Pius, they pronounced each of them a panegyric to his memory. They difcharged the government in a very amicable manner. It is said that, soon after Antoninus had performed the apotheosis of Pius, petitions were presented to him by the Pagan priefts, philosophers, and governors of provinces, in order to excite him to persecute the Chritlians; which he rejected with indignation, and interposed his authority for their protection, by writing a letter to the common affembly of Asia, then held at Ephefus (A). The happiness which the empire began to enjoy under these two emperors was interrupted, in the year 162, by a dreadful inundation of the Tiber. which destroyed a vast number of cattle, and occasioned a famine at Rome. This calamity was followed by the Parthian war; and at the fame time the Catti ravaged Germany and Rhætia. Lucius Verus went in person to oppose the Parthians; and Antoninus continued at Rome, where his prefence was necessary.

During this war with the Parthians, about the year 163 or 164, Autoninus sent his daughter Lucilla to Verus, she having been betrothed to him in marriage, and attended her as far as Brundusium: he intended to have conducted her to Syria; but it having been infi-Antoninus. nuated by fome perfors, that his defign of going into the east was to claim the honour of having finished the Parthian war, he returned to Rome. The Romans having gained a victory over the Parthians, who were obliged to abandon Mcsopotamia, the two emperors triumphed over them at Rome in the year 166; and were honoured with the title of Fathers of their country. This year was fatal, on account of a terrible pestilence which spread itself over the whole world, and a famine under which Rome laboured: it was likewise in this year that the Marcomanni, and many other people of Germany, took up arms against the Romans; but the two emperors having marched in person against them, obliged the Germans to fue for peace. The war, however, was renewed the year following, and the two emperors marched again in person; but Lucius Verus was seized with an apoplectic fit, and died at Altinum. The Romans were now defeated with great flaughter; and the emperor, not choosing to burden his subjects with new taxes, exposed to public sale the furniture of the palace, the gold and filver plate belonging to the crown, and his wife's rich garments embroidered with gold, and a curious collection of pearls, which Adrian had purchased during his long progress thro' the provinces of the empire, and was called Adrian's calinet.

In the year 170, Antoninus made vast preparations against the Germans, and carried on the war with great vigour. During this war, in 174, a very extraordinary event is faid to have happened, which according to Dion Cassius, was as follows: Antoninus's army being blocked up by the Quadi, in a very disadvantageous place, where there was no possibility of procuring water; in this fituation, being worn out with fatigue and wounds, oppressed with heat and thirst, and incupable of retiring or engaging the enemy, in an inflant the fky was covered with clouds, and there fell a vast quantity of rain: the Roman army were about to quench their thirst, when the enemy came upon them with fuch fury, that they must certainly have been defeated, had it not been for a shower of hail, accompanied with a storm of thunder and lightning, which fell upon the enemy, without the least annoyance to the Romans, who by this means gained the victory (B). In 175, Antoninus made a treaty with feveral nations of Germany. Soon after, Avidius Cashus, governor of Syrin, revolted from the emperor: this infurrection, however, was put an end to by the death of Cassius, who was killed by a centurion named Anthony. Autonious behaved with great lenity towards those who had been engaged in Cassius's par-

ty;

⁽A) Eusebius has preserved this letter, Hist. Eccles. lib. iv. cap. 13. but he falsely ascribes it to Antoninus Pius, whereas it was wrote by Marcus Antoninus, as Valerius makes it appear in his annotations on Eusebius.

⁽B) The Pagans, as well as Christians, according to Mr Tillemont (p. 621. art. xvi.), have acknowledged the truth of this prodigy, but have greatly differed as to the cause of such a miraculous event; the former ascribing it, some to one magician and some to another: In Antoninus's pillar, the glory is ascribed to Jupiter the god of rain and thunder. But the Christians assirmed, that God granted this favour at the prayer of the Christian foldiers in the Roman army, who are faid to have composed the twelfth or Melitene legion; and, as a mark of diffinction, we are told that they received the title of the Thundering Legion, from Antoninus (Euseb. Eccles. Hist. lib. v. cap. 5.) Mr Moyle, in the letters published in the fecond volume of his works, has andeavoured to explode this story of the Thundering Legion; which occasioned Mr Whiston to publish an aner, in 1726, entitled, Of the Thundering Legion; or, Of the miraculous deliverance of Marcus Antoninus and his way, upon the prayers of the Christians.

See Auan.

Antoninus ty; he would not put to death, nor imprison, nor even It in judgment himfelf upon any of the fenators engaged in this revolt; but he referred them to the fenate, fixing a day for their appearance, as if it had been only a civil affair. He wrote also to the senate, desiring them to act with indulgence rather than feverity; not to shed the blood of any senator or person of quality, or of any other person whatsoever, but to allow this honour to his reign, that, even under the misfortune of a rebellion, none had loft their lives, except in the first heat of the tumult. In 176, Antoninus visited Syria and Egypt: the kings of those countries, and ambasfadors also from Parthia, came to visit him. He staid feveral days at Smyrna; and, after he had fettled the affairs of the east, went to Athens, on which city he conferred feveral honours, and appointed public profeffors there. From thence he returned to Rome with his fon Commodus, whom he chofe conful for the year following, though he was then but 16 years of age, having obtained a dispensation for that purpose. On the 27th of September, the fame year, he gave him the title of Imperator; and on the 23d of December, he entered Rome in triumph, with Commodus, on account of the victories gained over the Germans. Dion Caffius tells us, that he remitted all the debts which were due to himself and the public treasury during 46 years, from the time that Hadrian had granted the same favour, and burnt all the writings relating to those debts. He applied himself likewise to correct many enormities, and introduced feveral excellent regulations. In the year 179, he left Rome with his fon Commodus, in order to go against the Marcomanni, and other barbarous nations; and the year following gained a confiderable victory over them, and would, in all probability, have entirely subdued them in a very short time, had he not been taken with an illness, which carried him off on the 17th of March 180, in the 59th year of his age, and 10th of his reign. The whole empire regretted the loss of so valuable a prince, and paid the greatest regard to his memory: he was ranked amongst the gods, and almost every person had a statue of him in their houses. His book of meditations has been much admired by the best judges.

ANTONINA'S Column. See COLUMN.

ANTONINUS'S Wall, the name of the third rampart or defence that had been built or repaired by the Romans against the incursions of the North Britons. It is called by the people in the neighbourhood, Graham's Dyke; from the notion that one Graham, or Grimus, first made a breach in it after the retreat of the Romans out of Britain. The first barrier erected by the Romans was See Agri- the chain of forts made by Agricola * from the frith of Forth to that of Clyde, in the year 81, to protect his conquests from the inroads of the Caledonians. The fecond was the vallum, or dyke, flung up by Adrian + in the year 121. It terminated on the western side of the kingdom at Axelodunum, or Brugh, on the Solway fands, and was supposed to have reached no further than Pons Ælii, or Newcastle, on the eastern. But from an inscription lately discovered, it appears to have ex-See Seve tended as far as the wall of Severus 1. This rampart of Adrian's was fituated much farther fouth than Agricoh's chain; the country to the north having been either, according to some authors, recovered by the native Britons after the departure of Agricola; or, ac-

cording to others, voluntarily flighted by Adrian. How. Antonims. ever, this work of Adrian's did not long continue to be the extreme boundary of the Roman territories to the north in Britain. For Antoninus Pius, the adopted fon and immediate fucceffor of Adrian, having, by his lieutenant Lollius Urbicus, recovered the country once conquered by Agricola, commanded another rampart to be erected between the friths of Forth and Clyde, in the track where Agricola had formerly built his chain of forts. The great number of inscriptions which have been found in or near the ruins of this wall, or rampart, to the honour of Antoninus Pius, leave us no room to doubt its having been built by his direction and command. If the fragment of a Roman pillar with an infeription, now in the college library of Edinburgh, belonged to this work, as it is generally supposed to have done, it fixes the date of its execution to the third confulship of Antoninus, which was A. D. 140, only 20 years after that of Adrian, of which this feems to have been an imitation. This wall or rampart, as some imagine, reached from Caer-ridden on the frith of Forth to Old Kirkpatrick on the Clyde; or, as others think, from Kinniel on the east to Dunglass on the These different suppositions hardly make a mile west. of difference in the length of this work, which, from several actual mensurations, appears to have been 37 English or 40 Roman miles. Capitolinus, in his life of Antoninus Pius, directly assirms, that the wall which that emperor built in Britain was of turf. This in the main is unquestionably true; though it is evident (from the veftiges of it still remaining, which not very many years ago were dug up and examined for near a mile together) that the foundation was of stone. Mr Camden also tells us, from the papers of one Mr Anthony Pont, that the principal rampart was faced with square stone, to prevent the earth from fulling into the ditch. The chief parts of this work were as follows: 1. A broad and deep ditch, whose dimensions cannot now be discovered with certainty and exactness, though Mr Pont fays, it was 12 feet wide. 2. The principal wal! or rampart was about 12 feet thick at the foundation, but its original height cannot now be determined. This wall was fituated on the fouth brink of the ditch. 3. A military way on the fouth fide of the principal wall, well paved, and raifed a little above the level of the ground. This work, as well as that of Adrian, was defended by garrifons placed in forts and flations along the line of it. The number of these forts or stations, whose vestiges were visible in Mr Pont's time, were 18, fituated at about the diftance of two miles from each other. In the invervals between the forts, there were turrets or watch towers. But the number of these, and their distance from each other, cannot now be difcovered.

It is not a little furprising that though it is now more than 1600 years fince this work was finished, and more than 1300 fince it was flighted, we can yet difcover, from authentic monuments, which are still remaining, by what particular bodies of Roman troops almost every part of was executed. This discovery is made from inferiptions upon thones, which were originally built into the face of the wall, and have been found in or near its ruins, and are carefully preferved. The number of stones with inscriptions of this kind now extant, is 11: of which fix may be feen at one view

Autoninus, in the college of Glasgow, one in the college of Aber-Antonio. deen, one in the college of Edinburgh, one in the collection of Baron Clerk, one at Cocknoch house, and one at Calder house. From these inscriptions it appears in general, that this great work was executed by the second legion, the vexillations of the fixth legion and of the twentieth legion, and one cohort of auxiliaries. If these corps were all complete, they would make in all a body of 7800 men. Some of these inscriptions have suffered greatly by the injuries of time and other accidents; fo that we cannot discover from them with absolute certainty, how many paces of this work were executed by each of these bodies of troops. The fum of the certain and probable information contained in these inscriptions, as it is collected by the learned and illustrious Mr Horsley, stands thus:

Paces. The fecond legion built 11,603 The vexillation of the fixth legion 7,411 The vexillation of the twentieth legion 7,801 All certain 26,815 The vexillation of the twentieth legion, the monument certain, and the number probable 3,414 The fame vexillation, on'a plain monument, no number visible, supposed 3,500

The fixth legion, a monument, but no number, 3,000 Cohors prima Cugernorum 3,000

Total 39,726 or 30 miles 726 paces, nearly the whole length of the wall. It would have been both useful and agreeable to have known how long time these troops were employed in the execution of this great work. But of this we have no information. Neither do we know what particular bodies of troops were in garrifon in the feveral forts and stations along the line of this wall, because thefe garrifons were withdrawn before the Notitia Imperii was written.

Though we cannot discover exactly how many years this wall of the emperor Antoninus continued to be the boundary of the Roman territories in Britain, yet we know with certainty that it was not very long. For we are told by an author of undoubted credit, that, in Dir. 1. 72. the reign of Commodus, A. D. 180, " he had wars with feveral foreign nations, but none fo dangerous as that of Britain. For the people of the island, having passed the wall which divided them from the Romans,

attacked them, and cut them in pieces."

ANTONIO (Nicholas), knight of the order of St James and canon of Seville, did great honour to the Spanish nation by his Bibliotheque of their writers. He was born at Seville in 1617, being the son of a gentleman whom King Philip IV. made prefident of the admiralty established in that city in 1626. After having gone through a course of philosophy and divinity in his own country, he went to fludy law at Salamanca; where he closely attended the lectures of Francisco Ramos del Manzano, afterwards counsellor to the king and preceptor to Charles II. Upon his return to Seville, after he had finished his law studies at Salamanca, he shut himself up in the royal monastery of Benedictines, Bibliother Affanica, having the use of the books of where he employed himself feveral years in writing his

Bennet de la Sana, abbot of that monastery and dean Antonio. of the faculty of divinity at Salamanca. In the year 1659, he was fent to Rome by King Philip IV. in the character of agent general from this prince: he had alfo particular commissions from the inquisition of Spain, the viceroys of Naples and Sicily, and the governor of Milan, to negociate their affairs at Rome. The cardinal of Arragon procured him, from Pope Alexander VII. a canoniy in the church of Seville, the income whereof he employed in charity and purchasing of books; he had above 30,000 volumes in his library. By this help, joined to continual labour, and indefatigable application, he was at last enabled to finish his Bibliotheca Hispanica, in four volumes in folio, two of which he published at Rome in the year 1672. The work confifts of two parts; the one containing the Spanish writers who flourished before the 15th century, and the other those fince the end of that century. After the publication of these two volumes, he was recalled to Madrid by King Charles II. to take upon him the office of counsellor to the crusade; which he discharged with great integrity till his death, which happened in 1684. He left nothing at his death but his vall library, which he had brought from Rome to Madrid; and his two brothers and ephews being unable to publish the remaining volumes of his Bibliotheca, fent them to Cardinal d'Aguisne, who paid the charge of the impression, and committed the care there to Monsieur Marti, his librarian, who added notes to them in the name of the cardinal.

Antonio (St), one of the Cape de Verd islands, lying in E. Long. 0. 26. N. Lat. 18. 10. It is feparated from St Vincent's by a clear navigable channel two leagues in breadth. On the north fide it has a good road for shipping, with a collection of fresh water rifing from springs, which, however, scarcely merits the name of a pond. The island stretches from northeast to fouth-west, and is filled with mountains; one of which is of fo extraordinary a height as to be compared with the Peak of Teneriffe: Its top is constantly covered with fnow, and, notwithstanding the clearness of the sky, is generally hid in clouds. Here are produced a variety of fruit; oranges, lemons, palms, melons, &c. and some fugarcanes. The potatoes and melons are particularly excellent, and any much fought after by mariners. But notween tanding all this plenty, the inhabitants live in the lift wretched poverty. They are in number about 500, chiefly negroes, under the protection of the Portuguese, whose language they speak, and imitate their manners. To the north-west stands a village, containing about 20 huts; and at least 50 families, under the direction of a governor, or, as they call him, a captain, a prieft, and a schoolmaster.

Antonio (St), a Dutch fort in Axim, on the Gold coast of Africa. It stands on a high rock, which projects into the sea in form of a peninsula; and is so environed by rocks and dangerous shoals, as to be inaccessible to an enemy but by land, where it is fortified by a parapet, drawbridge, and two batteries of heavy cannon. Befides this it has a battery towards the fea. The three batteries confift of 24 cannon. Its form is triangular; the building is neat, strong, and commodious for the extent, that being but small, on account of the narrowness of the rock on which it is built. The garrison is usually composed of 25 white men, and an equal number of negroes, under the command of a fer-

p. 820.

Antonius jeant. It is maintained at the expence of the West India Company; and when well stored with provisions, is capable of making a long defence against any number of negroes. It is, however, as well as all other forts on this coast, liable to inconveniences from the heavy and continual rains, which damage the walls, and render frequent reparations necessary. This obliges the Dutch always to keep ready a quantity of lime or cement made of calcined oyster shells, of which the coast produces great numbers .- This fettlement was first founded by the Portuguese during the reign of Emanuel. They fixed it first upon a small point; where, finding themselves insecure, they built the fort where it now stands. They were driven out by the Dutch in 1642; and, upon the conclusion of a peace with the States General, the fort remained by treaty in the hands of the Dutch West India Company, who have kept

possession of it ever since.

ANTONIUS (Marcus), a famous Roman orator. While he filled the office of prætor, Sicily fell to his lot, and he cleared the feas of the pirates which infelted that coast. He was made conful with A. Posthumius Albinus, in the year of Rome 653; when he oppofed the turbulent deligns of Sextus Titus, tribune of the people, with great refolution and fuccels. Some time after, he was made governor of Cilicia, in quality of proconful; where he performed to many great exphits, that he obtained the honour of a triumph. We cannot omit observing, that, in order to improve his great talent for eloquence, he became a scholar to the greatest men at Rhodes and Athens, in his way to Cilicia, and when on his return to Rome. Soon after, he was appointed cenfor; which office he discharged with great reputation, having carried his cause before the people, against Marcus Duronius, who had preferred an acculatian of bribery against him, in revenge for Antonius's having erased his name out of the lift of funators, which this wife cenfor had done, because Duronius, when tribune of the people, had abrogated a law which restrained immoderate expense in feasts. He was one of the greatest orators ever known at Rome; and it was owing to him, according to the testimony of Cicero, that Rome might boath herself a rival even to Greece itself in the art of eloquence. He defended, amongst many others, Marcus Aquilius; and moved the judges in so sensible a manner, by the tears he shed, and the scars he showed upon the breast of his client, that he carried his cause. He never would publish any of his pleadings, that he might not, as he faid, be proved to fay in one cause, what might be contrary to what he should advance in another. He assected to be a man of no learning. His modefty, and many other qualifications, rendered him no lefs dear to many perfons of diffinction, than his eloquence made him univerfally admired. He was unfortunately killed during those bloody confusions raised at Rome by Marius and Cinna. He was discovered in the place where he hid himfelf, and foldiers were fent to defpatch him: but his manner of addressing them had such an effect, that none but he who commanded them, and had not heard his difcourfe, had the cruelty to kill him. His head was exposed before the roftra, a place which he had adorned with his triumphal spoils. This happened 90 years before the Christian era.

Antonius (Marcus), the triumvir, grandson to Voù. II. Part I.

the former, was very handsome in his youth; for which Antonius, reason he was greatly beloved by Curio, a senator, who, Antonoby carrying him about in all his debaucheries, made him contract fuch heavy debts, that his own father forbade him his house. Curio, however, was so generous as to bail him for 250 talents. When the civil war broke out, Curio took Cafar's party, and prevailed with Antonius to do the same; for which he was made a tribune of the people, and in that office did Czefar great service. Cæsar having made himself master of Rome, gave Antonius the government of Italy: At the battle of Pharsalia, Casar consided so much in him, that he gave him the command of the left wing of his army, whilst he himself led the right. After Cæsar was made dictator, he made Antonius general of the horse, though he had never been prætor; in which command he exerted his power with the utmost violence. He was made conful, when Cafar enjoyed that honour for the fifth time, the last year of that usurper's life. On Ciesar's death, he harangued the populace with great art, and raifed their fury against his murderers; flattering himfelf that he should easily get into the place which Carfar had filled; but his haughty behaviour made him lose all the advantages his affected concern for Cæsar had gained him. His ill treatment of Octavius, and quarrel with him, produced another civil war; which ended in an accommodation between him, Octavius, and Lepidus, fatal to the peace of Rome. They agreed to share the supreme power among them; and many of the most illustrious Romans were facrificed by profeription to cement this bloody league, which is known by the name of the Second Triumvirate. But the triumvira were too ambitious, and hated one another too much. to be long united. Antonius went into Asia to raise money for his foldiers; during his absence, Fulvia his wife quarrelled with Octavius. When Antonius was in Asia, indulging himself in all manner of luxury, the famous Cleopatra inspired him with the most violent passion. Hearing of the quarrel between Fulvia and Octavius, and finding Octavius was become publicly his enemy, Antonius entered into a confederacy with Sextus Pompeius, who was still master of Sicily. He then went into Italy, in order to fight Octavius; but Fulvia, who had been the author and promoter of this war, dying, Octavius and Antonius came to an agreement.

ANTONOMASIA, a form of speech, in which, for a proper name, is put the name of some dignity. office, profession, science, or trade; or when a proper name is put in the room of an appellative. Thus a king is called his majefly; a nobleman, his lordfbip. We say the philosopher instead of Aristotle, and the ora-

One of the conditions of this new peace was, that they should together attack Pompey, though the former had

lately make an alliance with him. Antonius then mar-

ried Octavia, fister to Octavius, as a pledge of their re-

newed friendship: but returned foon after to his belowed Cleopatra, and again' lived with her in Alexandria.

Octavius took hold of this pretence to inveigh against

him, and begin the war again. At last they engaged in a fea fight at Actium, in which Octavius gained a

complete victory; which was followed by the deaths

both of Antonius and Cleopatra. The infatuated An-

tonius fell upon his own fword; and Cleopatra stung

herfelf to death with an afp, as was supposed, to avoid

gracing the victor's triumph at Rome.

Antolian- tor for Cicero: Thus a man is called by the name of his country, a German, an Italian; and a grave man is called a Cato, and a wife man a Solomon.

> ANTOSIANDRIANS, a feet of rigid Lutherans, who oppose the doctrine of Ofiander relating to justifi-These are otherwise denominated Ofandromastiges.—The Antofiandrians deny that man is made just, with that justice wherewith God himself is just; that is, they affert, that he is not made effentially, but only imputatively, just; or, that he is not really made

just, but only pronounced fo.

ANTRIM, the most northerly county of Ireland. It is bounded by that of Down on the fouth-east, that of Londonderry on the west, from which it is separated by the river Bann, part of Armagh on the fouth, St George's channel on the east, and the Deu-Caledonian ocean on the north. Its greatest length is about 46 miles, its greatest breadth about 27; and the number of acres it contains, plantation measure, are computed at 383,000. Though the country is much encumbered with bogs and marshes, yet it enjoys a pretty good air, and is well peopled, chiefly with Protestants. Where it is free from bogs the soil is fruitful. It fends two members for the shire, and two for each of the following towns, viz. Lifburn, Belfast, Antrim, and Randalstown.

Certain narrow valleys, called glyns, beginning here, and running a great way along the coast, belonged formerly to the Biffets, noblemen of Scotland, who, having been obliged to quit that country for having affassinated Patrick earl of Athole upon a private quarrel, came hither, and had a great estate bestowed upon them by Henry III. of England; of which, in the reign of Edward II. a part was forfeited by the rebellion of Hugh, then chief of the family. Another tract near this, called the Rowle, belonged anciently to the Macguillers, but now to the M'Donnels earls of Antrim.

Upon the coast of this county are the promontories called by Ptolemy, Robogdium, Vennicinium, and Boreum, now Fair Foreland, Ramsbead, and St Helen's bead. The river also, styled by the same author Vidua, and now Crodach, runs through this county .-Here also is the remarkable natural curiofity called the GLANT's Causeway, for a particular description of which

fee that article. Antrim, the capital town of the county of Antrim, in Ireland, feated at the north end of the lake Lough Neagh, about fix miles from the mouth of the bay, having a good road before it, with a pier near

the place, within which vessels lie dry at low water. It was anciently a borough of great confequence, as appears from the mayor's being admiral of a confiderable extent of coast, as well in Down as in this county; the corporation enjoying the customs paid by all vessels within those bounds, the creeks of Bangor and Belfast only excepted. This grant, however, the crown repurchased, and thereupon transferred the customhouse to Belfast, to which town it is now much inferior as well in fize as in trade. It is, however, still a place of note, and fends two members to the house of commons. It gives the title of earl to the noble family of M'Donnel.—At Antrim is a feat, with noble deracines, and beautiful and highly cultivated lands, of

the earl of Massareene. W. Long. 6. 26. N. Lat.

54. 45. It fends two members to parliament.

ANTRUM, among anatomists, a term used to de- Antrum, note several cavities of the body: as the antrum high- Antwerp. morianum, or that in the maxillary or jaw bone; antrum pylori, or that at the bottom of the pylorus,

ANTWERP, a city of the duchy of Brabant, in the Austrian Netherlands, capital of the marquifate of Antwerp, otherwise called the marquisate of the holy Roman empire, situated in E. Long. 4. 15. N. Lat. 54. 12. It lies in a low marshy ground on the Scheld, 24 miles from Brussels to the north. It is the third city in rank in Brabant, large and well built, containing 22 squares, and above 200 streets, all straight and broad, especially that called the Mere, in which fix coaches can go abreaft. Most of the houses are of freestone, and have an air of antiquity, being high, with courts before and gardens behind. At the head of the Mere is a crucifix of brass thirty-three feet high. The cathedral dedicated to the Virgin Mary, the stadthouse, and the exchange, are magnificent structures: the latter is the first building of that kind in Europe, and on its model the exchanges of London and Amsterdam are built. Its pillars are all of blue marble, and carved, but all in a different manner. The exchange cost the city 300,000 crowns. Antwerp, towards the end of the fifteenth century, was one of the most celebrated towns that ever existed. The Scheld, on which it stands, being 20 feet at low water, and rising 20 feet more at flood, ships of the greatest burden came up to the quays, as in the river Thames at London; but when the United Provinces formed themselves into a free state, after having shaken off the yoke of Spain, they got the entire command of the navigation of the Scheld; which ruined the trade of Antwerp, and transferred it to Amfterdam. This made the inhabitants turn their heads to painting, jewelling, and banking, which they have continued to this day with great fuccess and reputation; for at Antwerp bills of exchange may be negotiated for any fum to any part of Europe; and in the time of Queen Anne's wars, two brothers of the name of De Koning, paid the one the army of France, and the other that of the confederates. Besides, here is a fine manufacture of tapeftry and lace; and, for the promoting of trade, an infurance company has been erect-This city is the see of a bishop, who, as abbot of St Bernard, is the second prelate in Brabant. The bishopric is of great extent, and the cathedral a most noble pile, with one of the finest steeples in the world. The emperor Charles V. when he made his entry into Antwerp, faid it ought to be put in a case, and showed only once a year for a rarity. The house of the hanse towns, built when the city was in its flourishing condition, is a stately building, with magazines above for dry goods, and cellars below for wet, and in the middle story were 300 lodging rooms for merchants; but now it is turned to a horse barrack. There is a market here called the Friday's market, because it is held every Friday, where all sorts of household goods, pictures, and jewels, are sold by auction. No city in the Netherlands has so many and so fine churches as this. Many of them, particularly the cathedral and Jesuits church, are adorned with paintings, by Sir Peter Paul Reubens, who was a native of this city; and by Quintin Masseys, who is faid to have been a blackfmith; but having fallen in love

Antwerp love with a painter's daughter, and been told by her father, when he asked her of him in marriage, that he would have none but a painter for his fon-in-law, he went to Italy to fludy painting, and, in a few years, returned so eminent in his new profession, that he found no difficulty in obtaining the father's confent. He is interred at the entry of the cathedral, where his effigy is put up, with an infeription, fignifying, that conjugal love made an Apelles of a blacksmith. The abovementioned Jesuits church is extremely magnificent, and the chapel of the Virgin, joining to it, still more so. Among the cloisters the most remarkable are, the noble and rich abbey of St Michael, on the banks of the Scheld, the apartments of which are truly royal, and in which all fovereign princes that pass this way actually lodge; and the English nunnery, of the order of St Tcresa, the nuns of which never wear linen, nor eat flesh, and lie upon straw: the grates of the convent are fo difmal, that it looks like a prison. As to the fortifications of the city, it is environed with a fine wall, planted with rows of trees on each fide, with walks between, broad enough for two coaches to go abreast, being also defended by a very strong, large, regular citadel, in form of a pentagon, erected by the duke of Alva in 1568, which commands the town and the neighbouring country. The magistracy of this city is chosen only out of the seven patrician families; and confifts of two burgomafters and 18 echevins, besides inferior magistrates. Among the privileges granted to it by its princes, there is one by which every perfon born in it is a citizen, though both his father and mother were foreigners.

In 1585, Antwerp underwent a remarkable fiege by the duke of Parma. It was then the most wealthy city in the Netherlands, and had long been the object of his defigns; but the difficulties attending the enterprife obliged him to postpone it for a considerable time. In order to succeed, it was necessary to cut off the communication of the city with Holland, Ghent, and all places above and below Autwerp on the Scheld. To effect this, he laid fiege to Lifkenshouk and Tillo, places of the utmost consequence to the security and commerce of the city: both were obstinately defended; and the fiege of the latter was raifed, after it had been carried on for three months: however, the duke gained feveral other posts on the river, where he built forts, and greatly annoyed the shipping and trade of the city. He next laid fiege to Dendermonde, in order to cut off the communication with Ghent, in which he fucceeded by the reduction of the town. His next attempt was on Vilvorde: this place he took by affault, and thereby cut off the communication with Bruffels. Finding, however, this method of hemming in the city tedious, and ineffectual while an opening to the mouth of the river remained, he formed a design of building a bridge across the Scheld, the extremities of which were to be defended by ftrong forts and outworks. He began with collecting great quantities of wood at Callo and Fort St Philip, where he intended the bridge should be built; but his project was for some time retarded by the Antwerpers, who broke down the dykes, overflowed the whole country, and carried off his magazines by the inundation. Not discouraged by this loss, he applied himself diligently to repair it, and with incredible

expedition cut a canal from Steken to Callo, by which Antwerp, he carried off the waters. He then fet to work upon Anubiathe bridge, and finished it in seven months, without any interruption from the Zealanders. During the building of this bridge. Aldegonde, governor of Antwerp, proposed to build a fort on Couvensteyn dyke, in order to secure that important post, and then breaking down the dyke when the bridge was near finished: but he was violently opposed by certain citizens, who apprehended that their lands and villas would be destroyed by the inundation. This unfeasonable opposition, with the negligence of the magistrates, who, because the markets were high, had not laid in a sufficient flock of corn, occasioned the loss of the city. However, in despite of all the duke of Parma's precautions, the Zealanders found means to throw in a convoy of corn; but the citizens, knowing they would not run the risk of carrying it back again, so cheapened the price, that these bold traders refused ever to bring their goods again to so bad a market. The Antwerpers, having thus through avarice brought on their ruin, began in a short time to suffer by famine; they then pressed the Zealanders to attempt something for their relief, but it was now too late. While the magistrates were deliberating on fome means for destroying the bridge, which they might have prevented from being ever completed, one Ginebelli, a Mantuan engineer, offered his fervices, undertaking at a certain expence to blow it into the air. Even in this extremity the expence was grudged: but necessity at last overcame this obstacle; Ginebelli was furnished with two large velfels, a number of fmall boats, and every thing neceffary. He formed the two large vessels into fire ships, which he fet adrift with the stream, deceiving the enemy by means of falle fires lighted up in the fleet of small boats. The train of one of the fire ships was expended before the time expected, and the blew up with a terrible explosion, but with little damage to the bridge. The other was more successful, carrying off all the outworks, fetting fire to the whole bridge, and burying above 500 foldiers in the ruins it made. The fire, however, was foon extinguished, and the bridge repaired by the duke of Parma, while the Antwerpers were prevented by avarice from repeating the experiment; for that they were foon reduced to the greatest straits, and obliged to furrender. It is faid that the city of Amsterdam had obstructed every measure for the relief of Antwerp, hoping to profit by its destruction. It was not doubted but the Protestants would forfake it as foon as it fell into the hands of an arbitrary Catholic prince; and this conjecture was foon fulfilled by the removal of many families with their effects to Amtherdam .- After the battle of Ramillies, the city of Autwerp furrendered to the duke of Marlborough. It was taken by the French in 1746, but restored to the house of Austria at the treaty of Aix-la-Chapelle.

ANUBIS, a fymbolical deity of the Egyptians, was regarded as the faithful companion of Ofiris and of Ifis. Temples and priefts were confectated to him, and his image was borne in all religious ceremonics.

Cynopolis, the present Minieh, situated in the Lower Thebais, was built in honour of Anubis. The temple wherein he was worshipped no longer subsists. The priefts celebrated his fellivals there with great pomp,

Anubia and confecrated the dog to him as his living representation. "Anubis (fays Strabo) is the city of dogs, the capital of the Cynopolitan prefecture. animals are fed there on facred aliments, and religion has decreed them a worship." An event, however, related by Plutarch, brought them into confiderable discredit with the people. Cambyses having slain the god Apis, and thrown his body into a field, all animals respected it except the dogs, which alone ate of his flesh. This impiety diminished the popular veneration for them.

> Cynopolis was not the only city which burned incense on the altars of Anubis. He had chapels in almost all the temples. On solemnities, his image always accompanied those of Isis and Osiris. Rome having adopted the ceremonies of Egypt, the emperor Commodus, to celebrate the Isiac feasts, shaved his head, and himself carried the god Anubis. The statue of this god was either of massive gold or gilt, as well as the attributes that accompanied him. Anubis fignifies gilded. The denomination was mysterious; and the Egyptian priefts, it would feem, had not given it without reason.

> The fignification of this emblematical deity is thus explained by Plutarch; "The circle which touches and feparates the two hemispheres, and which is the cause of this division, receiving the name of Horizon, is called Anubis. He is represented under the form of a dog, because that animal watches day and night." St Clemens of Alexandria, who was well informed in the mystic theology of the Egyptians, favours this explication. The two dogs, fays he, (the two Anubes) are the fymbols of two hemispheres which environ the terrestrial globe. He adds in another place: Others pretend that these animals, the faithful guardians of men, indicate the tropics, which guard the fun on the fouth and on the north like porters.

> According to the former of these interpretations, the priests, regarding Anubis as the horizon, gilded his statue; to mark, that this circle, receiving the first rays of the fun, appears sparkling with brightness on his rifing, and that at his fetting he reflects his last rays upon the earth. They faid in their facred fahles, that Anubis was the fon of Ofiris, but illegitimate. In fact, he only gives to the earth a borrowed light; and cannot be esteemed, like Horus, as the father of the day, or as the legitimate offspring of Ofiris. It may be added, that the visible horizon turning with the fun, is his inseparable companion.

> In the latter of these explications, where Anubis represents the tropics, he is also the faithful guardian of Isis and Osiris. In fact, the course of the sun and of the moon is contained between the circles wherein the folflices are performed. They neither deviate to the right nor left. These limits assigned by the Author of nature might therefore, in hicroglyphic language, be represented by a divinity with the head of a dog, who seemed to oppose their passage on the side of the two poles. The other opinion, notwithstanding, seems more atural, and to be more analogous to the ideas of the bests.
>
> Upon the whole, it is reasonable to imagine, that

> Anubis at first was only a symbolical image, invented by aftronomers to give a fenfible expression of their discoveries; that afterwards, the people, accustomed to fee it in their temples, which were the depositaries

of science, adored it as a deity; and that the priests Anus favoured their ignorance by connecting it with their religion. The worship of Anubis introduced, that of Aornus. the dog became his emblem. Almost all-the gods of the Gentiles have originated in this manner.

ANUS, in anatomy, the lower extremity of the intestinum rectum, or orifice of the fundament.

ANVIL, a fmith's utenfil, ferving to place the work on to be hammered or forged. The face or uppermost surface of the anvil, must be very slat and fmooth, without flaws, and fo hard that a file will not touch it. At one end there is fometimes a pike, bickern or beak-iron, for the rounding of hollow work. The whole is usually mounted on a firm wooden block .- Forged anvils are better than those of call work, and the best have the upper part made of steel. Locksmiths have a smaller kind of anvil called the fake, which is moveable, and placed ordinarily on their work bench. Its use is for setting small cold work ftraight, or to cut or punch on with the cold chiffel or cold punch.

ANXUR, (anc. geog.), a city of the Volfci, in Latium; called Tarracina, by the Greeks and Latins: Now Terracina; fituated on an eminence (Livy, Horace, Sil. Italicus). Anxuras, a citizen of Anxur (Livy). And the epithet Anxurus, a name of Jupiter, worshipped without a beard at Anxur (Virgil). Tho' others read Axuras, or Axyrus, without a razor. E. Long. 14. 5. Lat. 41. 18.

AONIDES, in mythology, one of the many appellations of the Muses; so called from Aonia, a part of ancient Bœotia.

AORASIA, in antiquity, the invisibility of the gods. The word is Greek, mogaria, and derived from a priv. and ogas, to fee. The opinion of the ancients with regard to the appearance of the gods to men, was that they never showed themselves face to face, but were known from their backs as they withdrew. Neptune assumed the form of Calchas to speak to the two Ajaces; but they knew him not till he turned his back to leave them, and discovered the god by his majestic step as he went from them. Venus appeared to Æneas in the character of a huntress; but her son knew her not till she departed from him; her divinity was then betrayed by her radiant head, her flowing robe, and her majestic pace.

AORIST, among grammarians, a tense peculiar to the Greek language, comprehending all the tenfes; or rather, expressing action in an indeterminate manner, without any regard to past, present, or future,

AORISTIA, in the sceptic philosophy, denotes that flate of the mind wherein we neither affert nor deny any thing positively, but only speak of things as feeming or appearing to us in fuch a manner. The aoristia is one of the great points or terms of scepticism, to which the philosophers of that denomination had continual recourse by way of explication, or subter-Their adversaries, the dogmatists, charged them with dogmatizing, and afferting the principles and positions of their sect to be true and certain.

AORNUS, a very high rock of India, having its name from its extraordinary height, as being above the flight of a bird. Its circuit was about 25 miles, its height 11 furlongs, and the way leading up to the top artificial and narrow. At the bottom, on one fide, ran

Aornus | | | Aousta. the river Indus; on the top was a fine plain, part of which was covered with a thick wood; the refl arable land, with a fountain furnishing abundance of excellent water. This rock was taken by Alexander the Gree, in whose time there was a report that Hercules had attempted it in vain; however, according to Arrian, this report was without foundation. It is probable indeed, that it was raised after the place was taken, in order to magnify Alexander's exploit. While the Macedonian monarch was preparing all things necessary for the fiege, an old man with his two fons, who had long lived in a cave near the fummit, came and offered to show him a private way of ascending. This being readily accepted, Ptolemy, with a confiderable body of lightarmed troops, was defpatched with them, with orders, in case they succeeded, to entrench themselves strongly upon the rock, in the wood to which the old man was to direct them, before they ventured to attack the Indians. Ptolemy exactly executed his orders; and gave notice, by a lighted torch fet upon a pole, that he had got fafely up. Upon this, Alexander gave immediate orders for a body of troops to attempt the passage by which the rock was commonly ascended; but they were repulfed with great flaughter. He then fent an Indian with letters to Ptolemy, defiring him, the next time an attack was made by the common way, to fall upon the enemy behind. But in the mean time, those who defended the rock attacked Ptolemy with great vigour; but were at last repulsed, though with much difficulty: but the next day, when Alexander renewed the attack, though Ptolemy attacked the Indians in the rear, the Macedonians were repulfed on both fides. At last, the king perceiving that the strength of the Indians lay in the straitness and declivity of the way by which they were attacked, caused a great quantity of trees to be felled, and with them filled the cavities between the plain on which the Indians were encamped and the highest of his own advanced posts. The Indians at first derided his undertaking; but at length perceiving the ardour with which the work was carried on, and having felt the effects of the miffile weapons of the Macedonians, they fent deputies to propole terms of capitulation. Alexander, fuspecting that their defign was only to amuse him till they made their escape, withdrew his guards from the avenues. As foon as he knew the Indians were descended, he, with 700 of Ptolemy's light-armed foot, took possession of the deferted rock, and then made a fignal for his forces to fall upon the flying Indians. They, fetting up a loud shout, so terrified the fugitives, that numbers of them fell from the rocks and precipices, and were dashed to pieces, while the greatest part of the remainder were cut off in the roads.

AORTA, in anatomy, the great artery which rifes immediately from the left ventricle of the heart, and is from thence distributed to all parts of the body. It is divided into two grand trunks, distinguished by the epithets afcending and defeending. See ANATOMY.

AOUSTA, or Aost, a town of Italy, in Piedmont, and capital of the duchy of the fame name, a bishop's see, and subject to the king of Sardinia. It is remarkable for several monuments of the Romans, and for the birth of Anselm archbishop of Canterbury. It is seated at the foot of the Alps, on the river Doria. E. Long. 7. 33. N. Lat. 45. 38.

Aousta, a territory of Piedmont, with the title of a duchy. It is a valley 30 miles in length, and extends from the pass of St Martin's, near the frontiers Apalichian of Yvree, to St Bernard. It abounds in passures, and all sorts of fruits. The capital is of the same name.

AOUTA, the name of the paper mulberry tree at Otaheite, in the South Sea, from which a cloth is manufactured, that is worn by the principal inhabitants. See the article BARK.

APACHES, a people of New Mexico in North America. They are brave, resolute, and warlike, fond of liberty, and the inveterate enemies of tyranny and oppression. Of this disposition the Spaniards had fatal experience towards the end of the last century, when they revolted against the Catholic king, massacred several of his officers, and committed the greatest devastations. Ever since, they have remained the allies, not the subjects of the Spaniards; and the viceroy of Mexico has been obliged to maintain a more formidable garrison, and a greater number of troops.

APÆDUSIA, denotes ignorance or unskilfulness in what relates to learning and the sciences. Hence alfo persons uninstructed and illiterate are called apadeu-The term apadeuta was particularly used among the French in the time of Huet; when the men of wit at Paris were divided into two factions, one called by way of reproach apadeuta, and the others eruditi. The apadeute are represented by Huet as persons who, finding themselves either incapable or unwilling to undergo a fevere course of study in order to become truly learned, conspired to decry learning, and turn the knowledge of antiquity into ridicule, thus making a merit of their own incapacity. The apadeute in effect were the men of pleasure; the eruditi the men of study. The apadeuta in every thing preferred the modern writers to the ancient, to superfede the necessity of studying the latter. The eruditi derided the moderns, and valued themselves wholly on their acquaintance with the ancients.

APAGOGE, in logic. See Abduction.

APAGOGF, in the Athenian law, the carrying a criminal taken in the fact to the magistrate. If the accuser was not able to bring him to the magistrate, it was usual to take the magistrate along with him to the house where the criminal lay concealed, or defended himself.

APAGOGE, in mathematics, is sometimes used to denote a progress or passage from one proposition to another; when the first having been once demonstrated, is afterwards employed in the proving of others.

APAGOGICAL DEMONSTRATION, an indirect way of proof, by showing the absurdity of the contrary.

APALACHIAN MOUNTAINS, more properly called the Allegany Mountains, have their fouthern beginning near the bay of Mexico, in the latitude of 30°, extending northerly on the back of the British colonies, and running parallel with the sea coast to the latitude of 40° north; but their dislance from the sea, on the west, is not exactly known, though it is generally thought to be above 200 miles. A great part of these mountains is covered with rocks, some of which are of a stupendous height and bulk; the soil between them is generally black and sandy, but in some places differently coloured, composed of pieces of broken rock and

Fagus.

Apamea. spar, of a glittering appearance, which seem to be indications of minerals and ores, if proper fearch was made for them. Chefnuts and fmall oaks are the trees that principally grow on these mountains, with some * Fagus pu-chinkapin * and other small shrubs. . The grass is thin, mila. Scc mixed with vetch and small peafe; and in some places there is very little vegetable appearance.

> The rocks of the Apalachian mountains feem to engroß one half of the furface. They are mostly of a light gray colour; fome are of a coarle grained marble like alabaster; others of a metallic lustre: some pieces are in the form of flate, and brittle; others in lumps, and hard: and some appear with spangles, or covered over with innumerable small shining specks, like silver. These frequently appear at the roots of trees when blown down. The different spars are found most on the highest and steepest parts of the hills, where there is little grass and few trees; but the greatest part of the foil between the rocks is generally a dark fandycoloured kind of mould, and shallow; yet fertile, and productive of good corn, which encourages the Tallipoofes, a clan of the Cherokee Indians, to fettle among them in latitude 34°: and they are the only Indian nation that has a constant residence upon these mountains.

> APAMEA, or APAMIA, the name of several an-

1. One of Bithynia, formerly called Myrlea, from Myrlus, general of the Colophonians: destroyed by Philip, father of Perseus; and given to his ally Prusias, who rebuilt it, and called it Apamea, from the name of his queen Apama (Strabo). Stephanus fays, that Nicomedes Epiphanes, fon of Prusias, called it after his mother; and that it had its ancient name from Myrlea, an Amazon. The Romans led a colony thither (Strabo); called Colonea Apamena (Pliny, Appian). The gentilitious name is Apameus and Apamenus (Trajan in a letter to Pliny.)

2. Another Apamea, called Cibotos, of Phrygia, at fome distance from the Meander (Agathodæmon); but by a coin of Tiberius, on the Meander. The name is from Apame, mother of Antiochus Soter, the founder, and the daughter of Artabazus (Strabo). The rife, or at least the increase, of Apamea, was owing to the ruins of Celenæ. The inhabitants were called Apamienses; and, though inland, were worshippers of Neptune. The reason, it has been conjectured, was, that they had suffered often from earthquakes, of which he was supposed the author. Mithridates gave an hundred talents towards the restoration of the city; which, it is faid, had likewise been overthrown in the time of Alexander. Their tribute money was remitted to them for five years on the same account under the emperor Tiberius. The fubterraneous passage of the Lycus and the other streams showed that the ground had many cavities; and thefe, it has been furmifed, rendered the region very liable to be shaken.

3. A third, on the confines of Parthia and Media,

furnamed Raphane (Strabo, Pliny)

4. Armian); where a branch of the Euphra Called the Royal River, falls into the Tigris (Ptolemy)

A fifth in Mesopotamia, on the other side the epposite to Zeugma on this side, both founded by Seleucus, and joined by a bridge, from which Apanage the latter takes its name (Pliny, Infidor, Characenus).

6. A fixth Apamea, now Fumia, also in Syria, below Apaturia. the confluence of the Orontes and Marlyas; a strong city, and fituated in a peninfula, formed by the Orontes and a lake. "It is here (fays Strabo) that the Seleucidæ had established the school and nursery of their cavalry." The foil of the neighbourhood, abounding in pasturage, fed no lefs than thirty thousand mares, three hundred stallions, and five hundred elephants; inflead of which, the marshes of Famia at present scarcely afford a few buffaloes and sheep. To the veteran foldiers of Alexander, who here reposed after their victories, have succeeded wretched peasants, who live in perpetual dread of the oppressions of the Turks and the inroads of the Arabs.

Apamea was also the ancient name of Pella, in the

Decapolis.

APANAGE, or Appennage, in the French customs, lands affigned by a fovereign for the fubfillence of his younger fons, which revert to the crown upon the failure of male issue in that branch to which the lands are granted.

APANOMIA, a town of Santorin, an island in the Mediterranean Sca, called in this part by some the Sea of Candia. It has a spacious harbour, in the form of a half moon; but the bottom is fo deep, that ships care not anchor there. E. Long. 25. 59. N. Lat. 36. 18.

APANTHROPY, in medicine, denotes a love of folitude, and aversion for the company of mankind. Apanthropy is by some reckoned among the symptoms, by others among the species or degrees of melancholy; and also passes for an ill indication in leucophlegmatic

APARINE, in botany, a fynonyme of the urticularia and feveral other plants.

APARITHMESIS, in rhetoric, denotes the anfwer to the protasis or proposition itself. Thus, if the protasis be, Appellandi tempus non erat .- The aparithmefis is, At tecum anno plus vixi.

APARTISMENUS, in the ancient poetry, an appellation given to a verfe, which comprehended an entire fense or sentence in itself. This is sometimes also written apartemenus, i. e. suspended, as not needing any

following verfe.

APATHY, among the ancient philosophers, implied an utter privation of passion, and an infensibility of pain. The word is compounded of a priv. and mulos, affection. The Stoics affected an entire apathy; they confidered it as the highest wisdom to enjoy a perfect calmness or tranquillity of mind, incapable of being ruffled by either pleafure or pain. In the first ages of the church, the Christians adopted the term apathy to express a contempt of all earthly concerns; a state of mortification, such as the gospel prescribes. Clemens Alexandrinus, in particular, brought it exceedingly in vogue; thinking hereby to draw the philosophers to Christianity, who aspired after such a sublime pitch of virtue. Quietism is only apathy disguised under the appearance of devotion.

APATURIA, in antiquity, a folemn feast celebrated by the Athenians in honour of Bacchus. 'The word is usually derived from unurn, fraud. It is said to have been instituted in memory of a fraudulent victory obtained by Melanthus, king of Athens, over Xanthus,

ha, p. 136.

Apaulia king of Bootia, in a fingle combat, which they agreed upon, to put an end to a debate between them relating Apelytes to the frontiers of their countries. Hence Budzus calls it festum deceptionis. "the feast of deceit."

Other authors give a different etymology of this feast: They tell us, that the young Athenians were not admitted into the tribes on the third day of the apaturia, till their fathers had first sworn that they were their own children; and that, till that time, they were supposed, in some measure, to be without fathers, απατορις; whence the feaft, fay they, took its name. Xenophon, on the other hand, informs us, that the relations and friends met on this occasion, and joined with the fathers of the young people who were to be received into the tribes; and that from this affembly the feast took its name: that in ararveia, the a, far from being a privative, being here a conjunctive, figuifies the same thing with our, together. This feast lasted four days: the first day, those of the same tribe made merry together; and this they called dognie. The fecond day, which they called avagguoss, they facrificed to Jupiter and Minerva. The third day, which they called augustis, such of their young men and maids as were of age were admitted into their tribes. The fourth day they called emissing.

APAULIA, in antiquity, the third day of a marriage folemnity. It was thus called, because the bride, feturning to her father's house, did απαυλιζισθαι τυ τυμφιω, lodge apart from the bridegroom. Some will have the apaulia to have been the fecond day of the marriage, viz. that whereon the chief ceremony was performed; thus called by way of contradiffinction from thefirst day, which was called meanure. On the day called amaurie (whenever that was), the bride presented her bride-

groom with a garment called anauxilingia.

APE, in zoology, the general English name of a very numerous race of animals, the natural history of which is given at large under the article SIMIA; comprehending Apes, properly so called, or such as want tails; and Monkeys and Baboons, or fuch as have tails, the former long, and the other fbort, ones. See SIMIA.

Sea Ark, a name given by Steller to a marine animal which he saw on the coast of America, and is thus described *. "The head appeared like that of a dog, with sharp and upright ears, large eyes, and with both lips bearded: the body round and conoid; the thickest part near the head: the tail forked; the upper lobe the longest: the body covered with thick hair, gray on the back, reddish on the belly. It seemed destitute of feet. It was extremely wanton, and played a multitude of monkey tricks. It sometimes swam on one fide, sometimes on the other side of the ship, and gazed at it with great admiration. It made fo near an approach to the veffel, as almost to be touched with a pole; but if any body moved, it instantly retired. It would often fland erect for a confiderable space, with one-third of its body above water; then dart beneath the ship, and appear on the other side; and repeat the fame thirty times together. It would frequently arise with a fea plant, not unlike the bottle gourd, tofs it up, and catch it in its mouth, playing with it numberless fantastic tricks.

APELYTES, Christian heretics in the second century, who affirmed that Christ received a body from the four elements, which at his death he rendered back Apella, to the world, and so ascended into heaven without a Apelles.

APELLA, among physicians, a name given to those whose prepuce is either wanting or shrunk, so that it can no longer cover the glans. Many authors have supposed this sense of the word Apella warranted from the passage in Horace, credat Judaus Apella non ego. But, according to Salmasius and others, Apella is the proper name of a certain Jew, and not an

adjective fignifying circumcifed.

APELLES, one of the most celebrated painters of antiquity. He was born in the ifle of Cos, and flourished in the time of Alexander the Great, with whom he was in high favour. He executed a picture of this prince, holding a thunderbolt in his hand: a piece, finished with so much skill and dexterity, that it used to be faid there were two Alexanders; one invincible, the fon of Philip; the other inimitable, the production of Apelles. Alexander gave him a remarkable proof of his regard: for when he employed Apelles to draw Campaspe, one of his mistresses, having found that he had conceived an affection for her, he refigned her to him; and it was from her that Apelles is faid to have drawn his Venus Anadyomene.

One of Apelles's chief excellencies was his making his pictures so exactly resemble the persons represented; infomuch that the physiognomists are faid to have been able to form a judgment of the person's destiny as readily from his portraits as if they had feen the originals. But what is called grace was the characteristic of this artist. His pencil was fo famous for drawing fine lines, that Protogenes discovered by a single line that Apelles had been at his house. Protogenes lived at Rhodes: Apelles failed thither, and went to his house with great eagerness, to see the works of an artist who was known to him only by name. Protogenes was gone from home: but an old woman was left watching a large piece of canvals, which was fitted in a frame for painting. She told Apelles that Protogenes was gone out; and asked him his name, that she might inform her master who had inquired for him. "Tell him (fays Apelles) he was inquired for by this person;"-at the same time taking up a pencil, he drew on the canvass a line of great delicacy. When Protogenes returned, the old woman acquainted him with what had happened. That artift, upon contemplating the fine stroke of the line, immediately pronounced that Apelles had been there; for so finished a work could be produced by no other person. Protogenes, however, himfelf drew a finer line of another colour; and, as he was going away, ordered the old woman to show that line to Apelles if he came again; and to fay, "This is the person for whom you are inquiring." Apelles returned, and faw the line: he would not for thame be overcome; and therefore, in a colour different from either of the former, he drew fome lines so exquisitely delicate, that it was utterly impuffible for finer strokes to be made. Protogenes now confessed the superiority of Apelles, slew to the harbour in fearch of him, and resolved to leave the canvals with the lines on it for the aftonishment of future artifts.

Apelles showed great liberality of mind towards Protogenes. With ideas enlarged by education and litera-

Apelles ture, he was incapable of harbouring little jealousies of noble competitors; on the contrary, he was the first who made the works of Protogenes to be valued as they deferred among the Rhodians. He acknowledged that Protogenes was in some respects superior to himfelf; but that in one particular himself excelled, viz. in knowing when to take his hand from the picture; an art which Protogenes had not yet learned, and therefore over-worked his pieces. Apelles equally disapproved of too elaborate diligence, or too hasty negligence in execution. A fludied work of Protogenes he esteemed less on the one account; and on the other, when a filly painter once brought him a picture, and faid, "This I painted in a hurry,"-he replied, "Though you had not told me fo, I perceived it was painted in hafte: but I wonder you could not execute more fuch pieces in the fame time."

There are two stories related of Apelles, which show him to be at once an artist of modelty, in amending even trifling improprieties, when pointed out to him by competent judges; and yet of felf-confidence fufficient to make him know the perfection and value of his own paintings. It was customary with Apelles to expose to public view the works which he had finished, and to hide himself behind the picture, in order to hear the remarks passed on it by persons who chanced to view it. He once overheard himself blamed by a shoemaker for a fault in the flippers of fome picture: he corrected the fault which the man had noticed: but on the day following the shocmaker began to animadvert on the leg; upon which Apelles with some anger looked out from behind the canvass, and bade him keep to his own province, " Ne futor ultra crepidam." It is well known that Alexander forbade any one besides Apelles to paint his portrait. We are not, however, to conclude from this, that Alexander was a more ·skilful judge of painting than he was of poetry. Like Augustus, he cherished the fine arts more from vanity than tafte. A remarkable proof is given of this prince's inability to difcern merit, and of the painter's freedom in expressing the mortification he felt, when a work of " Alexander his was not fufficiently commended. (fays Ælian, Lib. ii. c. 3. Var. Hift.) having viewed the picture of himfelf which was at Ephefus, did not praife it as it deferved. But when a horse was brought in, and neighed at feeing the figure of a horse in the picture, as though it had been a real horse; O king! faid Apelles) this borfe feens to be by far a better judge of painting than you." It happened more than once that the horses drawn by him were mistaken for real ones, by living horses which saw and neighed at the pictures. In his finishing a drawing of this animal, a remarkable circumstance is related of him. He had painted a horse returning from battle, and had fucceeded to his wishes in describing every other mark that could indicate a mettlesome steed, impatient of restraint; there was wanting nothing but a foam of a bloody hue iffuing from the mouth. He again and again endeavoured to express this, but his attempts were unsuccessful. At aft, with vexation, he threw against the reins of the morse a sponge which had in it many colours; a mixture of which coming out of the sponge, and tinging the The works of Apelles were all admired; but the

if the celebrated were the picture of Alexander in the

temple of Diana at Ephefus, and that of Venus emerging from the fea. Alexander was drawn with thunder in his hand; and fuch relief was produced by the Apenzel. chiaro scuro in this piece, that the fingers seemed to shoot forward, and the thunderbolt to be out of the picture. His Venus Araduounun was esteemed the most exquisite figure which the pencil could create: it is therefore extolled by the Roman poets Propertius and Ovid; and the poet of Sidon, Antipater, has left us the following Greek epigram on it:

Tar avaduousvar are maleges alle Saharlas Κυπειν, Απελλειε μοχθον οξα γεαφιδος, Ως χερι συμμαρψασα διαδροχον υδαλι καίλαν Εκθλίδει νοιερων αφρον απο πλοκαμών, Αυθαι νυν ερεμσιν Αθηναιη το και Ηρη " Our ili ou progoat et sein sexopesta."

Anth. iv. 12.

Graceful as from her natal fea the springs, Venus, the labour of Apelles, view: With preffing hand her humid locks she wrings, While from her treffes drips the frothy dew: Ev'n Juno and Minerva now declare, "No longer we cortend whose form's most rare."

APENE, in antiquity, a kind of chariot wherein the images of the gods, were carried in procession on certain days attended with a folemn pomp, fongs, hymns, dancing, &c. It was very rich, made fometimes of ivory, or of filver itself, and variously decorated.

APENNINUS, now the Apennine; a mountain, or ridge of mountains, running through the middle of Italy. from northwest to the south-west for 700 miles, in the form of a crescent (Pliny); beginning at the Alps in Liguria, or the Rivierra di Genoa; and terminating at the strait of Messana, or at Reggio, and the promontory Leucopetra; and separating, as by a back or ridge, the Adriatic from the Tuscan sea (Pliny, Strabo, Ptolemy, Polybius, Vitruvius). This mountain, though high, is greatly short of the height of the Alps. Its name is Celtic, fignifying a high mountain.

APENRADE, a town of Denmark in the duchy of Sleswick, seated at the bottom of a gulf in the Baltic sea, between Flensbourg and Hadaschleben. It is 25 miles north from Sleswick. E. Long. 9. 28.

N. Lat. 55. 4

APENZEL, a town of Switzerland, in the canton of the same name, seated on the river Chus, E. Long. 9. 1. N. Lat. 47. 31. The canton itself, which was allied to the others in 1513, confilts only of three or four valleys; having the town and abbey of St Gall on the north; the county of Toggenburg on the west; the lordship of Sax in the canton of Zurich, and that of Gambs in the canton of Schweitz, on the fouth; and the Rheinthall, or Rhine-valley, on the east. Its greatest length is about 30 miles, and its breadth about 20. It yields good pasturage, and consequently is not destitute of cattle, milk, butter, or cheese. Considerable quantities also of wheat, rye, barley, oats, beans, peafe, flax, and wine, are produced in it; besides a great deal of fruit, wood, and turf; with mineral waters, and warm baths. There are many mountains in the canton, the highest of which is that called the Hobefantis, or the Hobe Mesmer, which commands a prospect of a prodigious extent. There are also several lakes and rivers. The inhabitants, who are partly ProApex.

Apeplia testants, and partly Roman Catholics, subsist chiefly by their manufactures of linen, crape, fustian, and thread, or by bleaching, and the fale of their cattle, butter, cheefe, horses, wood, and coal. Of the twenty-three parishes in the canton, four are Popish, and nineteen Protestant. Before the Reformation, the inhabitants were subject to the abbot of St Gall; but they then shook off his yoke, and united themselves with the other cantons: after that, however, there were violent animofities between the Papists and Protestants, the former continually perfecuting the latter, till at last, in 1587, by the mediation of the other cantons, the two parties came to an accommodation, by which certain diffricts were affigned to each party, whereas before they lived promiscuously together; and though these two divisions now constitute but one canton, yet each forms a diffinct community or free state, sending its particular representatives to the diets of the confederacy, and having its separate councils and officers. In spirituals the Papists are subject to the bishop of Constance, but the Protestants to their own consistory. The militia of the former does not exceed 3000, whereas those of the latter amount to 10,000.

APEPSIA, (from a negative, and minde, to digeft.)

Indigestion.

Abstemiousness and excess are alike causes of indi-An over-distension of the stomach may in fome measure injure its proper tone; and long fasting, by inducing a bad quality in the juices secerned into the ftomach, renders it feeble, and generates wind. Hard drinking, and any of the causes of an anorexy, also injure digestion.

The columbo root is faid to be particularly useful when the stomach is languid, the appetite defective, digestion with difficulty carried on, or when a nausca with flatulency attends. It is prescribed in substance, with any grateful aromatic, or infused in Madeira wine, now and then interposing gentle doses of the tincture

A mixture of mustard seed with the columbo root is of admirable utility in complaints of this kind; particularly where acidity and flatulence prevail much in the the primæ viæ.

APER, in zoology, a synonyme of the sus scrofa.

See Sus.

APERIENTS, in the materia medica, an appellation given to such medicines as facilitate the circulation of the humours by removing obstructions.—The five aperient roots of the shops are, smallage, fennel, asparagus, parsley, and butcher's broom.

APERTURE, the opening of any thing, or a hole

or cleft in any continuous fubject.

APERTURE, in geometry, the space between two right lines which meet in a point and form an angle.

APERTURE, in optics, a round hole in a turned bit of wood or plate of tin, placed within the fide of a telescope or microscope, near to the object glass, by means of which more rays are admitted, and a more distinct appearance of the object is obtained.

APPRTURES, or Apertions in architecture, are used to

fignify doors, windows, chimneys, &c.

APETALOSE, or APETALOUS, among botanists, an appellation given to fuch plants as have no flower leaves.

APEX, the vertex or fummit of any thing. Vol. II. Part I.

APEX, in antiquity, the crest of a helmet, but more especially a kind of cap worn by the flamens.

Apex, among grammarians, denotes the mark of a Aphelium.

long fyllable, falfely called a long accent.

APHACA (anc. geog.), the name of a place in Syria, fituated between Heliopolis and Byblus, near Lebanon; infamous for a temple of Venus, called Aphacetis, near which was a lake, round which fire usually burst forth, and its waters were so heavy, that bodies floated on them. The temple was destroyed by Constantine, as being a school of incontinence, (Eufebius.) The name is of Syriac origin, fignifying em-

APHÆRESIS, in grammar, a figure by which a letter or fyllable is cut off from the beginning of a word. Thus ciconia by aphæresis, is written conia; contemnere, temnere ; omittere, mittere, &c.

A like retrenchment at the end of a word is called

APOCOPE.

APHÆRESIS, in medicine, denotes a necessary taking away or removal of fomething that is noxious .-In furgery, it fignifies an operation whereby fomething

superfluous is taken away.

APHANES: A genus of the monogynia order, belonging to the tetrandria class of plants; and in the natural method ranking under the 35th order, Senticofa. The effential characters are thefe: The calyx is divided into eight parts; there is no corolla; the feeds are two, and naked. There is only one species, the arvenfis, or penfley-piert, a native of Britain. It is extremely common in corn fields. The stalks rife five or fix together; they are three inches long, round, hairy, and procumbent: the leaves stand very thick upon them, and are roundish, but divided, as it were, into three parts, and those decoly ferrated at their edges. The flowers come out in a double feries, arranged all along the branches, and are of a greenish white, and the whole plant is of a grayish or whitishgreen colour.

APHASIA, (from u, and φημι, "I speak,") in the fceptic philosophy, denotes a flate of doubt, wherein a person not knowing what to determine on, it is best for him to be filent. In this fense, aphasia stands opposed to phasis, under which are included both affer-

tion and negation.

APHEK, the name of feveral cities mentioned in Scripture. 1. Aphek in the tribe of Judah, where the Philitlines encamped when the ark was brought from Shiloh, which was taken by them in battle, I Sam. iv. 1, 2, &c. It is thought to be the same with Aphekah mentioned in Josh. xv. 53. 2. Aphek in the valley of Jezreel, where the Philistines encamped while Saul and his army were near Jezreel, upon the mountains of Gilboa, I Sam. xxix. 1, &c. 3. Aplick a city belonging to the tribe of Asher, near the country of the Sidonians; (Josh. xix. 30. and xiii. 4.). 4. Aphek a city of Syria, one of the principal in Benhadad's kingdom, near which the battle was fought between Ahab and Benhadad, wherein the Syrians were worsted; and whereof, as they retreated with precipitation into the city, the walls fell upon them, and crushed in pieces 27,000, (1 Kings xx. 26, et feq.) This city lay between Heliopolis and Byblus.

APHELIUM, or APHELION, in astronomy, is that point in any planet's orbit, in which it is farthest di-

itanı

Aphion, stant from the sun, being that end of the greater axis of the elliptical orbit of the planet most remote from the focus where the fun is.

APHIOM, KARAHISSART, a town of Natolia, in Afiatic Turkey; it is named Aphiom because it produces a great deal of opium, called aphiom by the Turks. E. Long. 32. 18. N. Lat. 38. 35

APHIS, in zoolog y, the puceron, vine-fretter, or PLANT-LOUSE; a genus of infects belonging to the The rostrum or beak of order of infecta hemptera. the aphis is inflexed; the antennæ or feelers are longer than the thorax; the wings are four, and erect, or they are wanting; the feet are of the ambulatory kind; and the belly often ends in two horns, from which is ejected that most delicate juice called honeydew. See Honer-dew.

Linnæus enumerates 33 species of the aphis, all of them inhabitants of particular plants, from which their trivial names are taken; as aphis ribis, ulmi, rofe, &c. And he adds, that there feems to be a greater variety of plants producing aphides than there are different forts of this infect. But some late observers have been able to diffinguish more than double the above number of species; and it is probable that many more remain still to be added, as many of the same kind of plants are found to support two or three quite different forts of aphides. Thus the plum tree has two forts very diffinct from each other; one of a yellowish green, with a round short body; the other of a blueish green, as it were enamelled with white, and the shape more oblong. On the goofeberry bush and currant the same aphides may be found; but each of these is inhabited by two very different species: the one being of a dusky green, with a fhort plump body; the other of a paler green, the body more taper, and transversely wrinkled. The rofe tree, again, supports not less than three dulinct species: the largest is of a deep green, having long legs of a brownish cast, with the joints of a very dark brown, as are also the horns and antennæ; a fecoud fort is of a paler green, has much shorter legs, and a more flat body; the third fort is of a pale red, its body transverfely wrinkled, and is most frequently on the fweet-briar.

The extraordinary nature of these insects have for fome time past justly excited the wonder and attention of naturalitis. They were long ranked among the animals which had been classed with the true androgynes spoken of by Mr Breynius; for having never been catched copulating, it was halfuly concluded that This, however, they multiplied without copulation. was but a doubt, or at belt a mere furmise: but this furmife was believed and adopted by Mr Reaumur; and tho' he supported it by some observations peculiar to himself, the question remained still undecided, till Mr Bonnet seemed to have cleared it up in the affirmative, by taking and shutting up a young aphis at the instant of its birth, in the most perfect folitude, which yet brought forth in his fight 95 young ones. The fame experiment being made on one of the individuals of this family, that had been tried with its chief, the new hermit foon multiplied I ke its parent; and one of this third generation, in like manner brought up in folitude, proved no less fruitful than the former. Repeated experiments, in this respect, as far as the fifth or fixth-generation, all uniformly prefenting the observer with fecund virgine, were communicated to the

Royal Academy of Sciences; when an unforeseen and Aphie. very strange suspicion, imparted by MrTrembley to Mr Bonnet engaged him a-new in a feries of still more painful experiments than the foregoing. In a letter which that celebrated observer wrote to him from the Hague, the 27th January 1741, he thus expresses himfelf: " I formed, fince the month of November, the defign of rearing feveral generations of folitary pucerons, in order to fee if they would all equally bring forth young. In cases so remote from usual circumstances, it is allowed to try all forts of means; and I argued with myfelf, Who knows but that one copulation might serve for several generations?" This " cubo knows," to be fure, was next to avouching nothing; but as it came from Mr Trembley, it was sufficient to perfuade Mr Bonnet that he had not gone far enough in his investigation. If the fecundity of aphides was owing to the fecret copulation fuggefied by Mr Trembley; this copulation ferved at least five or more succesfive generations. Mr Bonnet therefore reared to the amount of the tenth generation of folitary aphides, and had the patience to keep an account of the days and hours of the births of each generation. In short, it was discovered, That they are really distinguished by fexes: That there are males and females amongst them, whole amours are the least equivocal of any in the world: that the males are produced only in the tenth generation, and are but few in number; that thefe, foon arriving at their full growth, copulate with the females: that the virtue of this copulation ferves for ten generations; that all these generations, except the first, (from the secundated eggs), are produced viviparous; and all the individuals are females, except those of the last generation, among whom, as we have already observed, some males make their appearance, to lay the foundation of a fresh series .- These circumstances have been confirmed by other naturalists. In particular we have a curious and accurate detail of them by Dr Richardson of Rippon, in the Philosophical Transactions, Vol. XI. art. 22. an extract of which we shall here insert, in order to give the reader as full an infight into the nature of thefe fingular infects, as can be done by a mere detail of facts in themselves utterly unaccountable.

"The great variety of species which occur in the infects now under confideration, may make an inquity into their particular nature feem not a little perplexed; having them, however, skilfully reduced under their proper genus, the difficulty is by this means confiderably diminished. All the insects comprehended under any distinct genus, we may reasonably suppose to partake of one general nature; and, by diligently examining any of the particular species, may thence gain some infight into the nature of all the rest. With this view I have chosen, out of the various forts of aphides, the largest of those found on the rose tree; not only as its fixe makes it the more conspicuous, but as there are few others of fo long a duration. This fort appearing early in the spring, continues late in the autumn; while feveral are limited to a much shorter term, in conformity to the different trees and plants from whence they draw their nourishment.

1. " If at the beginning of February the weather happens to be fo warm as to make the buds of the rose tree swell and appear green; small aphides are frequently to be found upon them, not larger than the

Aphis young ones in fummer when first produced. But there being no old ones to be found at this time of the year, which in fummer I had observed to be viviparous, I was formerly not a little perplexed by fuch appearances, and almost induced to give credit to the old ductrine of equivocal generation. That the same kind of animal should at one time of the year be viviparous, and at another time oviparous, was an epinion I could then by no means entertain. This, however, frequent observation has at last convinced me to be fact; having found those aphides which appear early in the spring, to proceed from fmall black oval eggs which were deposited on the last year's shoots in autumn: though, when it happens that the infects make too early an appearance, I have observed the greatest part to suffer from the sharp weather that usually succeeds, by which means the role trees are some years in a manner freed from them.

> "Those which withstand the severity of the weather feldom come to their full growth before the month of April; at which time they usually begin to breed, after twice casting off their exuvize or outward covering. It appears then that they are all females, which produce each of them a very numerous progeny, and that without having intercourse with any male insect. As I observed before, they are viviparous; and what is equally uncommon, the young ones all come into the world backwards. When they first come from the parent they are enveloped by a thin membrane, having in this fituation the appearance of an oval egg; which, I apprehend, must have induced Reaumur to suspect that the eggs discovered by Bonnet were nothing more than mere abortions. These egg-like appearances adhere by one extremity to the mother; while the young ones contained in them extend the other; by that means gradually drawing the ruptured membrane over the head and body to the hind feet. During this operation, and for some time after, by means of something glutinous, the fore part of the head adheres to the vent of the parent. Being thus suspended in the air, it foon frees itself from the membrane in which it was confined, and, after its limbs are a little strengthened, is fet down on some tender shoot, and then left to provide for itself.

> 2. " In the fpring months, there appear on the rofe trees but two generations of aphides, including those which immediately proceed from the last year's eggs; the warmth of the summer adds so much to their fertility, that no less than five generations succeed one another in the interval. One is produced in May, which cafts off its covering; while the months of June and July each supply two more, which cast off their coverings three or four times, according to the different warmth of the season. This frequent change of the outward covering is the more extraordinary, as it is the oftenest repeated when the insects come the soonest to their growth; which I have sometimes observed to happen in ten days, where warmth and plenty of nourishment have mutually conspired. From which considerations I am thoroughly convinced that these various coverings are not connate with the infect; but that they are, like the scarf skin, successively produced.

> " Early in the month of June, fome of the third generation which were produced about the middle of May, after casting off their last covering, discover four

erect wings, much longer than their bodies: and the Aphisfame is observable in all the succeeding generations, which are produced during the fummer months; without, however, distinguishing any diversity of fex, as is usual in several other kinds of insects. For some time before the aphides come to their full growth, it is eafy to discover which of them will have wings, by a remarkable fullness of the breast, which, in the others, is hardly to be diffinguished from the body. When the last covering is rejected, the wings, which were before folded up in a very narrow compass, gradually extend themselves in a most surprising manner, till their dimensions are at last very considerable. But these winged ones have the peculiarity, that the number of them does not feem fo much to depend on their original structure, as on the quantity or quality of the nourishment with which they are supplied: it being frequently observed, that those on a succulent shoot have few or none with wings among them, while others of the same generation, on a less tender branch, are most of them winged; as if only the first rudiments of wings were composed in the former, while nature thought proper to expand them in the latter, that they might be more at liberty to supply their wants.

"The increase of these insects in the summer time is fo very great, that, by wounding and exhausting the tender shoots, they would frequently suppress all vegetation, had they not many enemies which restrain them. To enumerate the variety of other infects that in their worm and fly state are constantly destroying them, would exceed the bounds of the present design: there is one, however, so singular in the manner of executing its purpose, that I cannot pass by it without some further notice. This is a very small black ichneumon fly, with a flender body and very long antennæ, which darts its pointed tail into the bodies of the aphides, at the fame time depositing an egg in each. This egg produces a worm, which feeds upon the containing mfect till it attams its full growth; when it is ufually changed to that kind of fly from whence it came. In this, however, it is fometimes prevented by another fort of small black fly, which wounds this worm through its pearl-like habitation; and by laying one of its eggs therein, initead of the former fly, produces its own likeness. I must, however, further observe, notwithstanding these infects have many enemies, they are not without friends; if we may confider those as fuch who are very officious in their attendance, for the good things they expect to reap thereby. The ant and the bee are both of this kind, collecting the honey in which the aphides abound; but with this difference, that the ants are conflant vifitors, the bee only when flowers are scarce. To which let me also add, that the ants will fuck in the delicious nectar while the aphides are in the act of discharging it from the anus; but the bees only collect it from the leaves on which this honey dew has fallen.

3. "In the autumn I find three more generations of aphides to be produced; two of which make their appearance in the month of August, and the third ulually appears before the middle of September. As the two first differ in no respect from those which we meet with in fummer, it would be wasting time to dwell any longer upon them; but the third, differing greatly from all the rest, demands our giving it a more Aphis. ferious attention. Though all the aphides which have hitherto appeared were females, in this tenth generation are found several male insects; not that they are by any means fo numerous as the females, being only produced by a finall number of the former generation. To which I must further add, that I have observed those which produce males, previously to have produced a number of females; which in all respects resembling those already described, I shall decline taking into any further confideration.

> "The females have at first altogether the same appearance with those of the former generations; but in a few days their colour changes from a green to a yellow, which is gradually converted into an orange colour before they come to their full growth. They differ likewise in another respect, at least from those which occur in the fummer, that all those yellow females are without wings. The male infects are, however, still more remarkable, their outward appearance readily diffinguishing them from the females of this and of all other generations. When first produced, they are not of a green colour like the rest, but of a reddish brown; and have afterwards, when they begin to thicken about the breaft, a dark line along the middle of the back. These male insects come to their full growth in about three weeks time, and then cast off their last covering; the whole infect being, after this operation, of a bright yellow colour, the wings only excepted. But after this they foon change to a darker yellow; and in a few hours to a very dark brown; if we except the body, which is fomething lighter coloured, and has a reddish cast. They are all of the winged fort: and the wings, which are white at first, foon become transparent, and at length appear like very fine black gauze.

> "The males no fooner come to maturity than they copulate with the females: in which act they are readily discovered, as they remain in conjunction for a confiderable time, and are not eafily diffurbed. The commerce between them continues the whole month of October, and may be observed at all times of the day, though I have found it most sequent about noon; especially when the weather is moderately warm, and the fun overcait. The females, in a day or two after their intercourse with the males, I have observed to lay their eggs; which they usually do near the buds, when they are left to their own choice. Where there are a number crowded together, they of course interfere with each other; in which case they will frequently deposite their eggs on other parts of the branches, or even on the spines with which they are befet."

These insects are found in great numbers not only on the stems and leaves, but even upon roots of many ee Plate I, trees and plants. Those trees that are most loaded (Vol. 1.) with the infects, as already observed, suffer greatly from them. The plant lice thrust their sharp pointed rostrum into the substance of the leaf to draw out their sustenance, which warps the stems and leaves, and occasions in the latter eavities underneath, and swellings above; nay, every fome, a kind of hollow gall filled with infects, as is often scen on elnt leaves.

It appears aftonishing that the slight puncture of so fmall au animal should so greatly disfigure a plant; but it must be remembered, that plant lice always live an numerous affociations, which increase visibly by the prodigious fruitfulnels of those insects; so that although Aphlastum each puncture be flight, yet the number of them is fo great, fo reiterated, that it is no longer a wonder the Aphrodita. leaves should be disfigured. Lovers of gardening and plants are extremely anxious to free and cleanse their trees from this vermine; but their care often proves unavailing, the infect is so fruitful that it soon produces a fresh colony. The best and surest method of extirpating it is to put on the trees infested with them fome larvæ of the plant louse lion, or aphidivorous flies *; for those voracious larvæ destroy every day a * See Cocgreat number of the infects, and that with fo much cinella, Ichthe more facility, as the latter remain quiet and mo-neumon, Hetionless in the neighbourhood of those dangerous enemies, who range over heaps of plant lice, which they gradually waste and diminish.

APHLASTUM, in the ancient navigation, a wooden ornament, shaped like a plume of feathers, fastened on the goose's or swan's neck used by the ancient Greeks in the heads of their ships. The aphlaftum had much the same office and effect in a ship that the crest had on the helmet. It seems also to have had this further use, viz. by the waving of a party coloured ribband fastened to it, to indicate from what quarter

the wind blew.

APHONIA, among physicians, signifies a suppresfion or total loss of voice. It is never a primary dif-ease; but a consequence of many different disorders. The cure is to be effected by removing the diforder from whence the aphonia proceeds.

APHORISM, a maxim or principle of a science; or a fentence which comprehends a great deal in a few The word comes from apoeiça, I separate; q. d. a choice or select sentence.—The term is chiefly used in medicine and law. We say the aphorisms of Hippocrates, of Sanctorius, of Boerhaave, &c. aphorifms of the civil law, &c.

APHRACTI, in the ancient military art, denotes open veffels, without decks or hatches, furnished only at head and stern with cross planks, whereon the men

flood to fight.

APHRODISIA, in antiquity, festivals kept in homour of Venus, the most remarkable of which was that celebrated by the Cyprians. At this folemnity feveral mysterious rites were practifed: all who were initiated to them offered a piece of money to Venus as an harlot, and received as a token of the goddes's favour a measure of salt, and a pannes; the former, because salt as a concretion of sea water, to which Venus was thought to owe her birth; the latter, because she was the goddness of wantonness.

APHRODISIACS, among physicians, medicines which increase the quantity of femen, and create an in-

clination to venery.

APHRODITA, in zoology, an infect of the order of vermes mollufca. The body of the aphrodita is oval, with many small tentacula or protuberances on each fide, which ferve as fo many feet: The mouth is cylindrical at one end of the body, and capable of being retracted, with two briftly tentacula. There are four species of this insect; viz. 1. The aculeata, by fome called the fea mouse, with 32 tentacula or feet, an inhabitant of the European feas, and often found in the belly of the cod fish. It feeds upon shell fish. Sec Plate XV. fig. 4. 2. The scabra, of an oblong shape, **fcabrous**

Aphrodite scabrous on the back, with 20 tentacula. It inhabits the Belgic fea. It it fometimes taken off Brighthelmflone an inch long. 3. The squamata, with 24 feet, and scaly on the back. The mouth is wrapt up in an aperture, and the tail is terminated by a few very short briftles. It inhabits the European ocean. 4. The imbricata is very like the former, only its scales are more glabrous. It inhabits the Northern ocean.

APHRODITE, in mythology, a name of Venus, derived from apos, froth; because, according to the poets, Venus is supposed to have been produced from

the froth or foam of the sea.

APHRONIT'RE, in natural history, a name given by the ancients to a particular kind of natrum.

APHTHÆ, in medicine, small, round, and superficial ulcers arising in the mouth. See MEDICINE,

APHTHARTODOCETÆ, a fect, sworn enemies of the council of Chalcedon. The word is derived from aptagos, incorruptible, and dozsa, I imagine; and was given them, because they imagined the body of Jefus Christ was incorruptible and impassible, and not capable of death. They arose among the Eutychians, and made their first appearance in the year 535.

APHYLLANTHES, LEAFLESS FLOWER, OF BLUE MONTPELIER PINK: A genus of the monogynia order, belonging to the hexandria class of plants; and in the natural method ranking under the 5th order, Te-In character it differs not from the trupetaloide. Juncus or rush, but in having a calyx of six petals, whereas the juncus has no calyx. There is only one fpecies, the Monspelienses, a native of France. root confifts of a number of flender, hard, woody, long, and contorted fibres: the radical leaves are very numerous, two inches long, extremely narrow, and wither very quickly. The stalk is round, smooth, without a joint or knot, naked, and tolerably firm; at its top stands a single and very beautiful blue slower, arising from a kind of compound imbricated cup.

APIARY, a place where bees are kept. See the article BEE.

APIASTER, in ornithology, the trivial name of a species of the merops. See MEROPS.

APICES, in botany, the same with ANTHERÆ.

APICIUS. There were at Rome three of that name, famous for their gluttony: the fecond is the most celebrated of the three. He lived under Tiberius, fpent immense sums on his belly, and invented divers forts of cakes which bore his name. He kept as it were a school of gluttony at Rome. After having spent two millions and a half in entertainments, finding himself very much in debt, he examined into the state of his affairs; and seeing that he had but 250,000 livres remaining, he poisoned himself, out of apprehension of flarving with fuch a fum. He had proflituted himself when very young to Sejanus.

APINA, or Apina, a town of Apulia, built by Diomedes, as was also Tricæ (Pliny). Apine and Trice is a proverbial faying for things trifling and of no value (Martial); and Apinarii was the appellation

for triflers or buffoons, (Trebellius Pollio).

APION, a famous grammarian, born in Egypt, was a professor at Rome in the reign of Tiberius. He had all the arrogance of a mere pedant, and amused himself with difficult and infignificant inquiries. One

117 of his principal works was his Antiquities of E- Apis.

APIS, in mythology, a divinity worshipped by the ancient Egyptians at Memphis. It was an ox, having certain exterior marks; in which animal the foul of the great Ofiris was supposed to subfift. This animal had the preference to all others, as being the symbol of agriculture, the improvement of which that prince had so much at heart.

According to feveral learned writers on the Egyptian religion, Apis was only a fymbolical deity. "Amongst the animals confecrated to ancient rites (fays Amnianus Marcellinus), Mnevis and Apis are the most celebrated: the first is an emblem of the fun, the second of the moon." Porphyry tells us, that Apis bore the characteristic figns of the two stars; and Macrobius, who confirms this opinion, adds, that he was equally confecrated to them both.

This bull, become the object of public adoration, it may be supposed, could not be born like other animals; accordingly the priests published that his origin was "An Apis is seldom born, (says Pomponius celestial. "An Apis is seldom born, (fays Pomponius Mela). He is not produced by the ordinary laws of generation. The Egyptians fay he owes his birth to celestial fire." Plutarch explains this passage: "The priefts pretend that the moon diffuses a generative influence, and as foon as a cow who takes the bull is struck by it, she conceives an Apis. Accordingly we discover in him the figns of that star.

Such were the fables industriously spread by those who prefided over the divine inflitutions. The vulgar, to whom this emblematical deity prefaged abundance, received them eagerly, and implicitly believed them. Pliny has described the characters which distinguished this facred bull: "A white spot, refembling a crefcent, on the right fide, and a lump under the tongue, were the diftinguishing marks of Apis." When a cow, therefore, which was thought to be ftruck with the rays of the moon, produced a calf, the facred guides went to examine it, and if they found it conformable to this description, they announced to the people the birth

of Apis, and fecundity.

"Immediately (fays Ælian) they built a temple to the new god, facing the riling fun, according to the precepts of Mercury, where they nourished him with milk for four months. This term expired, the pricits repaired in pomp to his habitation, and faluted him by the name of Apis. They then placed him in a vessel magnificently decorated, covered with rich tapeftry, and resplendent with gold, and conducted him to Nilopolis, finging hymns, and burning perfumes. There they kept him for forty days. During this space of time, women alone had permission to see him, and saluted him in a particular manner. After the inauguration of the god, in this city, he was conveyed to Memphis with the fame retinue, followed by an innumerable quantity of boats, fumptuoufly decked out. There they completed the ceremonies of his inauguration, and he became facred to all the world. Apis was fuperbly lodged, and the place where he lay was myflically called the bed. Strabo having vitited his palace, thus describes it: " The edifice where Apis is kept, is situated near the temple of Vulcan. He is fed in a facred apartment, before which is a large court. The house in which they keep the cow that produced

him, occupies one of its fides. Sometimes, to fatisfy the curiofity of strangers, they make him go out into this court. One may fee him at all times through a window; but the priests produce him also to public view." Once a year (fays Solinus) they present a heifer to him, and the same day they kill her.

A bull, born in fo marvellous a manner, must be possessed of supernatural knowledge. Accordingly the priests published, that he predicted future events by gestures, by motions, and other ways, which they conitrued according to their fancy. " Apis (fays Pliny) has two temples called Beds, which serve as an augury for the people. When they come to confult him, if he enters into a particular one, it is a favourable prefage, and fatal if he passes into the other. He gives answers to individuals by taking food from their hands. He refused that offered him by Germanicus, who died foon after." It would be unjust to conclude, that this respectable writer gave credit to such auguries. He relates the opinion of the Egyptians, and contents himself with citing facts without offering his judge-

Such was the installation of Apis. His anniversary was always celebrated for seven days. The people asfembled to offer facrifices to him, and what is extraordinary, oxen were immolated on the occasion. This folemnity did not pals without prodigies. Ammianus Marcellinus, who has collected the testimonies of the ancients, relates them in these words: " During the feven days in which the priests of Memphis celebrate the birth of Apis, the crocodiles forget their natural ferocity, become gentle, and do no harm to anybody."

This bull, however, so honoured, must not exceed a mysterious term fixed for his life. " Apis (fays Pliny) cannot live beyond a certain number of years. When he has attained that period they drown him in the fountain of the priests; for it is not permitted, adds Ammianus Marcellinus, to let him prolong his life beyond the period prescribed for him by the sacred books." When this event happened, he was embalmed, and privately let down into the subterraneous places destined for that purpose. In this circumstance, the priests announced that Apis had disappeared; but when he died a natural death, before this period arrived, they proclaimed his death, and folemnly conveyed his body to the temple of Serapis.

" At Memphis was an ancient temple of Serapis which strangers were forbidden to approach, and where the priests themselves only entered when Apis was interred. It was then (fays Plutarch) that they opened the gates called Lethe and Cocythe (of oblivion and lamentation), which made a harsh and piercing found."

Ammianus Marcellinus, and Solinus, paint with great energy the general despair of the Egyptians, who with cries and lamentations demanded another Apis from

According to Plutarch, the term prescribed for the of Apis was 25 years; which number marked a fiod of the fun and of the moon, and the bull was Consecrated to these two bodies. Syncellius, in his Chronography, when he comes down to the 32d Phataoh, called Aseth, says, " before Aseth, the solar year fifthed of 360 days. This prince added five to complete its course. In his reign a calf was placed amongst the gods, and named Apis." And in the Bibliotheca of Fabricius we have the following passage: It was customary to inaugurate the kings of Egypt at Memphis, in the temple of Apis. They were here first initiated in the mysteries, and were religiously invested; after which they were permitted to bear the yoke of the god, through a town to a place called the Sanduary, the entrance of which was prohibited to the profane. There they were obliged to swear that they would neither infert months nor days in the year, and that it should remain composed of 365 days, as had been established by the ancients."-From these facts, Mr Savary, in his letters on Egypt, infers, that Apis was the tutelar divinity of the new form given to the folar year, and of the cycle of 25 years, discovered at the fame time. This deity, besides, had a marked relation to the swelling of the Nile, as is tellified by a great number of historians. The new moon which followed the fummer solftice, was the era of this phenomenon, on which the eyes of every body were fixed: And Pliny speaks as follows on this subject: Apis had on his right fide a white mark, representing the crescent: This mark (continues Ælian) indicated the commence-ment of the inundation." If Apis possessed the characteristic signs which proved his divine origin, he promifed fertility and abundance of the fruits of the earth. It feems demonstrated, therefore, Mr Savary adds, that this facred bull, the guardian of the folar year of 365 days, was also regarded as the genius who presided over the overslowing of the river. The priests by fixing the course of his life to 25 years, and by making the installation of a new Apis concur with the renewal of the period above mentioned, had probably perceived, as the refult of long meteorological observations, that this revolution always brought about abundant feafons. Nothing was better calculated to procure a favourable reception of this emblematical deity from the people, fince his birth was a prefage to them of a happy inundation, and of all the treatures of teeming nature.

The folemnity of his inauguration was called Apparition. That which was renewed every year towards the 12th or 13th of the month Payn, which correfponds with the 17th or 18th of June, was called the birth of Apis. It was a time of rejoicing, which Aclian describes in the following manner: " What feltivals! what facrifices take place in Egypt at the commercement of the inundation! It is then that all the people celebrate the birth of Apis. It would be tedious to describe the dances, the rejoicings, the shows, the banquets, to which the Egyptians abandon themselves on this occasion, and impossible to express the intoxication of joy which breaks forth in all the towns of the king-

These observations Mr Savary thinks further confirmed by the name of this respectable bull; Apis, in the Egyptian tongue, fignifying number, measure. This epithet perfectly characterizes an animal effablished as the guardian of the solar year, the type of the cycle of 25 years, and the presage of a favourable inundation.

Monsieur Heut, bishop of Avranches, has endeavoured to prove that Apis was a symbolical image of the patriarch Joseph, and has supported his opinion

with all his erudition. Dr Bryant apprehends that the name of Apis was an Egyptian term for a father; that it referred to the patriarch Noah; and that the crefcent which was usually marked on the side of the animal, was a representation of the ark.

APIS, or BEE, in zoology, a genus of infects belonging to the order of infects hymenoptera. The mouth is furnished with two jaws, and a proboscis infolded in a double sheath; the wings are four in number, the two foremost covering those behind when at rest: In the anus or tail of the semales and working

bees there is a hidden sting.

These insects are distinguished into several species, each of which has its peculiar genius, talent, manners, and disposition. Variety prevails in the order of their architecture, and in the nature of their materials. Some live in society, and share the toils; such are the common bee and the drone. Others dwell and work in solitude, building the cradles of their families; as the least-cutter bee does with the rose tree leas; the upholsterer with the gaudy tapestry of the corn rose; the mason-bee with a plaster, the wood-piercer with sawdust. All are employed in their little hermitage, with the care of providing for the wants of their posterity.—The species enumerated by Linnæus are no fewer than 55; of which the following are the most remarkable:—

1. The florifomis, or black bee with a cylindrical incurvated belly, having two toothed-like protuberances at the anus, and a kind of prickles on the hind legs. This bee fleeps in flowers. 2. The dentata, or finning green bee, with black wings, and a kind of teeth on the hind thighs. The tongue of this bee is almost as long as its body. 3. The variegata; the breast and belly are variegated with white and black spots; the legs are of an iron colour. It is a native of Europe. This species sleeps in the geranium phæum, or spotted crane's bill. 4. The rolliata is diftinguished by the upper lip being inflected and of a conical shape, and by the belly being invested with bluish belts. They build their nelts in high faudy grounds, and there is but one young in each neft. 5. The ferruginea, or fmooth black bee, with the feelers, mouth, belly, and feet of an iron colour. This is a finall bee, and fuppoied to be of an intermediate kind between the bee and wasp. It is a native of Europe. 6. The cariofa is a yellowish hairy bee; and the feet and front are of a bright yellow colour. It builds in the rotten trees of Europe. 7. The brafilianorum, or pale red hairy bee, with the basis of the thighs black. This is a very large bee, everywhere covered with a tellaceous skin. It is a native of America. 8. The lapidaria, or red hairy bee, with a yellow anus, builds in holes of rocks. 9. The terrethris is black and hairy, with a white belt round the breaft, and a white anus: it builds its neft very deep in the earth. 10. The violacea is a red bec, and very hairy, with bluith wings. It is a native of Europe. The violacea is faid to perforate trees, and hollow them out in a longitudinal direction; they begin to build their cells at the bottom of these holes, and deposite an egg in each cell, which is composed of the farina of plants and honey or a kind of gluten. 11. The muscorum, or yellow hairy bee with a white belly, builds in mosfly grounds. The skill displayed by these builders is admirable. In order to enjoy the

pleafure of feeing their operations, let a nest be taken to pieces, and the mofs conveyed to a distance. The bees will be feen to form themselves into a chain, from their nest to the place where the moss has been laid. The foremost lays hold of some with her teeth, clears it bit by bit with her feet (which circumstance has also gotten them the name of carding bees), then, by the help of her feet, she drives the unravelled moss under her belly; the fecond, in like manner, pushes it on to the third. Thus there is formed an uninterrupted chain of moss, which is wrought and interwoven with the greatest dexterity by those that abide by the nest; and to the end, their neft may not be the sport of the winds, and may shelter them from rain, they throw an arch over it, which they compose with a kind of wax, tenacious, though thin in substance, which is neither the unwrought bees wax nor the real wax. Dissolved in oil of turpentine, it may be used in taking off impressions. 12. The centuncularis, leaf-cutter, or black bee, having its belly covered with yellow down. The nests of this species are made of leaves curiously plaited in the form of a mat or quilt. There are several varieties of the leaf-cutting bees, all equally industrious. They dig into the ground, and build their nefts, of which some have the form and fize of thimbles inserted one within another, others the shape and size of goose quills. These nests are composed of pieces of leaves. Each fort of bees cuts into its own materials; some the rose tree leaf, others the horse chesnut. A careful obferver may discover rose tree leaves cut as it were with a pinking iron; and there he may procure himself the pleasure of seeing with what dexterity a bee, destitute of any mathematical infrument, cuts out a circular piece, fit to be either the bottom or the lid of one of these nests: others it cuts out into ovals and semi-ovals, which form the fides of the nefts, into each of which it deposites one egg with ready prepared victuals. 19. The mellifica, or domestic honcy bee. But the particulars concerning this valuable species are so numerous and interesting as to require a separate article for their detail; which the reader will therefore find at due length under the English or popular name BEE.

In the Philosophical Transactions, No 172+, we have + Vol. I. C an account of a species of honey bee found in some parts of America, very different in form and manners from the common bee of Europe. Their combs are composed of a series of small bottles or bladders of wax, of a dusky brown or blackish colour; and each of these is much of the fize and shape of a Spanish olive. They plate LV hang together in clusters, almost like a bunch of grapes, and are so contrived, that each of them has its aperture, while the bees are at work upon it; but as foon as it is filled with honey, this aperture is closed, and the bees leave it, and go to work upon another vessel. Their lodgings are usually taken up in the hollow of an old tree, or in some cavity of a rock by the sea side. They are fagacious in choofing the most fecure retreats, because their honey is so delicious a bait, that they are hunted after by many animals; and they have no power of defending themselves, having no stings as our bees have. The combs are brittle; and the honey is clear and liquid like rock water. It is used by the natives rather as a drink with their food than as honey. They use it also in medicine as a purge, drinking half a pint

of it in the morning failing.

The

The Abbé Clavigero, in his history of Mexico, mentions a species similar in every respect to ours, but without the sting. This is the bee of Yucatan and Chiapa, which makes the fine clear honey of Estabentun, of an aromatic flavour, superior to that of all the other kinds of honey with which we are acquainted. The honey is taken from them fix times a-year, that is, once in every other month; but the best is that which is got in November, being made from a fragrant white flower like jessamine, which blows in September, called in that country Estatentum, from which the honey has derived its name. This honey is faid to be in high estimation with the Europeans who touch at the ports of Yucatan. According to our author, the French of Guarico buy it sometimes for the purpose of sending it as a present to the king. Another species described by the same author, resembles in its form the winged ants, but is smaller than the common bee, and without a sting. This insect, which is peculiar to warm and temperate climates, forms nefts in fize and shape resembling sugar loaves, and even sometimes greatly exceeding these in size, which are sufpended from rocks, or from trees, and particularly from the oak. The populousness of these hives is much greater than those of the common bee. The nymphs of this bee, which are eatable, are white and round, like a pearl. The honey is of a grayish colour, but of a fine flavour.

APIUM, PARSLEY: A genus of the digynia order, belonging to the pentandria class of plants; and in the natural method ranking under the 45th order, Umbellatæ. The fruit is of an oval shape, and streaked; the involucrum consists of one leaf; and the petals are inflected. There are only two species of apium; the petroselinum, or common parsley, a native of Sardinia; and the graveolens or smallage, a native of Britain: the culture of both which are well known.

Medicinal Uses, &c. The roots and seeds of the petroselinum are used in medicine. The root of parsley is one of the five aperient roots, and in this intention is fometimes made an ingredient in apozems and diet drinks: if liberally used, it is apt to occasion statulencies; and thus, by distending the viscera, produces a contrary effect to that intended by it: the taste of this root is somewhat sweetish, with a light degree of warmth and aromatic flavour. The feeds are an ingredient in the electuary of bay berries .- The roots of fmallage are also in the number of aperient roots, and have been sometimes prescribed as an ingredient in aperient apozems and diet drinks, but are at present disregarded. The feeds of the plant are moderately aromatic, and were formerly used as carminatives; in which intention they are, doubtlefs, capable of doing fervice, though the other warm feeds, which the shops are furnished with, render these unnecessary; and accordingly the Edinburgh college, which retains the agots, has expunged the feeds.

Besides its medicinal virtues above mentioned, the common parsley is reckoned an effectual cure for the rot in sheep, provided they are fed with it twice aweek for two or three hours each time: but hares and rabbits are so fond of this herb, that they will come from a great distance to feed upon it; and in the countries where these animals abound, they will de-

ftroy it if not very securely senced against them; so Apivorus that whoever has a mind to have plenty of hares in their fields, may draw them from all parts of the country by cultivating parsley.

APIVORUS, in ornithology, a synonyme of a spe-

cies of falco. See Falco.

APLUDA: A genus of the monœcia order, belonging to the polygamia class of plants; and in the natural method ranking under the 4th order, Gramina. The caylx is a bivalved gluma; the floscules of the female are seeffile, and the male floscules are furnished with pedunculi; the semale has no calyx; the corolla has a double valve; there is but one stylus, and one covered seed. The male has three stamina. There, are three species of apluda, viz. the mutica, aristata, and zengites, all natives of the Indies.

APOBATANA, the metropolis of Media, and where the kings kept their treasure (Isidorus Characenus); supposed to be the same with Echatana.

APOBATERION, in antiquity, a valedictory speech or poem made by a person on departing out of his own country, and addressed to his friends or relations.

APOBATHRA, a place near Sestos (Strabo); the landing place where Xerxes's ships were frozen and stuck in the ice (Eustathius).

APOCALYPSE, REVELATION, the name of one of the facred books of the New Testament, containing revelations concerning several important doctrines of Christianity. The word is Greek, and derived from

unoxulunta, to reveal, or discover.

This book, according to Irenæus, was written about the year 96 of Christ, in the island of Patmos, whither St John had been banished by the emperor Domitian. But Sir Isaac Newton places the writing of it earlier, viz. in the time of Nero. Some attribute this book to the arch-heretic Cerinthus: but the ancients unanimously ascribed it to John, the son of Zebedee, and brother of James; whom the Greek fathers called the Divine, by way of eminence, to distinguish him from the other evangelists. This book has not, at all times, been esteemed canonical. There were many churches in Greece, as St Jerome informs us, which did not receive it; neither is it in the catalogue of canonical books prepared by the council of Laodicea, nor in that of St Cyril of Jerusalem: but Justin, Irenæus, Origen, Cyprian, Clemens of Alexandria, Tertullian, and all the fathers of the fourth, fifth, and the following centuries, quote the Revelation as a book then acknowledged to be canonical. The Alogians, Marcionites, Cerdonians, and Luther himself, rejected this book: but the Protestants have forfaken Luther in this particular; and Beza has strongly maintained against his objections, that the Apocalypfe is authentic and canonical.

The Apocalypse consists of twenty-two chapters. The three first are an instruction to the bishops of the seven churches of Asia Minor. The fisteen following chapters contain the persecutions which the church was to suffer from the Jews, heretics, and Roman emperors. Next St John prophesies of the vengeance of God, which he will exercise against those persecutors, against the Roman empire, and the city of Rome; which, as the Protestants suppose, he describes under the name of Babylon the great whore, seated upon

Apocalypse seven hills. In the last place, the 19th, 20th, 21st, and
22d chapters, describe the triumph of the church over
Apocryphalits enemies, the marriage of the Lamb, and the hap-

piness of the church triumphant.

" It is a part of this prophecy (fays Sir Isaac Newton), that it should not be understood before the last age of the world; and therefore it makes for the credit of the prophecy, that it is not yet understood. The folly of interpreters has been to foretel times and things by this prophecy, as if God defigned to make them prophets. By this raffiness they have not only exposed themselves, but brought the prophecy also into contempt. The defign of God was much otherwise: He gave this and the prophecies of the Old Testament, not to gratify men's curiofities, by enabling them to foreknow things; but that, after they were fulfilled, they might be interpreted by the events; and his own providence, not the interpreters, be then manifested thereby to the world. And there is already fo much of the prophecy fulfilled, that as many as will take pains in this study, may see sufficient instances of God's providence.

There have been feveral other works published under the title of Apocalypfes. Sozomen mentions a book used in the churches of Palestine, called the Apocalypfe, or Revelation of St Peter. He also mentions an Apocalypse of St Paul: which the Cophtæ retain to this day. Eusebius also speaks of both these Apocalypses. St Epiphanius mentions an Apocalypse of Adam; Nicephoius, an Apocalypse of Esdars: Gratian and Cedrenus, an Apocalypse of Moses, another of St Thomas, and another of St Stephen; St Jerome, an Apocalypse of Esias. Porphyry, in his life of Plotin, makes mention of the Apocalypse or Revelations of Zoroasler, Zostrian, Nichothæus, Allo-

genes, &c.

APOCOPE, among grammarians, a figure which cuts off a letter or fyllable from the end of a word; as

ingeni for ingenii.

APOCRISARIUS, in ecclefiaftical antiquity, a fort of refident in an imperial city, in the name of a foreign church or bishop, whose office was to negotiate, as proctor at the emperor's court, in all ecclefiastical causes in which his principals might be concerned. The institution of the office seems to have been in the time of Constantine, or not long after, when, the emperors being become Christians, foreign churches had more occasions to promote their suits at court than formerly. However, we find it established by law in the time of Justinian. In imitation of this officer, almost every monastery had its Apocrisarius, or resident, in the imperial city.

The title and quality of Apocrifary became at length appropriated to the Pope's agent, or Nuncio, as he is now called; who refided at Conflantinople, to receive the Pope's despatches, and the emperor's answers. The

word is formed from Anoxemen, to answer.

APOCRUSTICS, in medicine, the same with repellents. See REPELLENTS.

APOCRYPHA, or APOCRYPHAL BOOKS, such books as are not admitted into the canon of Scripture, being either not acknowledged as divine, or considered as spurious. The word is Greek; and derived from are, and revote to hide or conceal.

When the Jews published their facred books, they Vol. 11. Part I.

gave the appellations of eanonical and divine only to Apocrypha, fuch as they then made public: fuch as were still re-Apocynum. tained in their archives they called apocryphal, for no other reason but because they were not public; so that they might be really sacred and divine, though not promulged as such.

Thus, in respect of the Bible, all books were called apperyphal which were not inserted in the Jewish canon of Scripture. Vossius observes, that, with regard to the sacred books, none are to be accounted apportyphal, except such as had neither been admitted into the synagogue nor the church, so as to be added to the

canon, and read in public.

The Protestants do not only reckon those books to be apocryphal which are esteemed such in the church of Rome, as the prayer of Manasseh king of Judah, the third and fourth books of Esdras, St Barnabas's epistle, the book of Hermos, the addition at the end of Job, and the 151st psalm; but also Tobit, Judith, Essher, the book of Wisdom, Jesus the sonof Sirach, Baruch the prophet, the Song of the Three Children, the History of Susannah, the History of Bel and the Dragon, and the sirit and second books of the Maccabees.

It is now pretended that these books were not received by the Jews, or so much as known to them. None of the writers of the New Testament ente or mention them: neither Philo nor Josephus speak of them. The Christian church was for some ages an utter stranger to these books. Origen, Athanasius, Hilary, Cytil of Jerusalem, and all the orthodox writers, who have given catalogues of the canonical books of Scripture; unanimously occur in rejecting these out of the canon. And for the New Testament, they are divided in their opinions, whether the epistle to the Hebrews, the epistle of St James, and the second epistle of St Peter, the second and third epistles of St John, the epistle of St Jude, and the Revelation, are to be acknowledged as canonical or not.

The Protestants acknowledge such books of Scripture only to be canonical as were so esteemed to be in the first ages of the church; such as are cited by the earliest writers among the Christians as of divine authority, and after the most diligent inquiry were received and so judged to be by the council of Laodicea. The several epistles above mentioned, and the book of Revelation, whatever the sentiments of some particular persons are or may have been of them, are allowed by all the reformed churches to be parts of the canon of the New Testament.

The apocryphal books, however, according to the fixth article of the church of England, are to be read for example of life and instruction of manners; but it doth not apply them to establish any doctrine.

APOCYNUM, (America), of ame and acres, a dog, because the ancients believed this plant would kill dogs), DOGSBANE: A genus of the digynia order, belonging to the pentandria class of plants; and in the natural method ranking under the 30th order, Contoria. The essential characters are: The corolla is bell-shaped; and the silaments are sive, alternate with the stamina.

Species. Of this genus botanical writers enumerate 11 species: of which the following are the most remarkable: 1. The venetum, with an upright herbaceous stalk, grows on a small island in the sea near Venice, but is supposed to have been originally brought Q from

Apocynum from some other country. There are two varieties of this; one with a purple, and the other with a white flower. The roots creep very much, and by them only it is propagated; for it feldom produces any feeds either in the gardens where it is cultivated, or in those places where it grows naturally. Mr Miller tells us, that he had been affured by a very curious botanist, who refided many years at Venice, and constantly went to the fpot feveral times in the feafon to procure the feeds, had any been produced, that he never could find any pods formed on the plants. The stalks rife about two feet high, and are garnished with smooth oval leaves placed opposite; the flowers grow at the top of the stalks, in small umbels, and make a very pretty appearance. The flowers appear in July and August. 2. The speciosissimum, with large flowers, is a native of Jamaica in the favannahs, whence it has the name of awannab flower, by which it is generally known in that island. This fort rifes three or four feet high, having woody stalks which fend out a few lateral branches, garnished with smooth oval leaves placed by pairs opposite, of a shining green colour on their upper sides, but pale and veined underneath. The flowers are produced from the fides of the branches, upon long footflalks: there are commonly four or five buds at the end of each; but there is feldom more than one of them which comes to the flower. The flower is very large, having a long tube which spreads open wide at the top, of a bright yellow, and makes a fine appearance, especially in those places where the plants grow naturally, being most part of the year in flower. 3. Cordatum, with a climbing stalk. 4. The villofum, with hairy flowers and a climbing stalk. These were discovered at La Vera Cruz in New Spain, by Dr William Houston, who sent their feeds to England. They are both climbers, and mount to the tops of the tallest trees. In England they have climbed over plants in the stoves, and risen to upwards of 20 feet high. The third fort has produced flowers feveral times: but the fourth never thowed an appearance of any.

Culture. The first fort is hardy enough to live in England in the open air, provided it is planted in a warm fituation and dry foil. It is propagated, as we have already observed, by its creeping roots; the best time for removing and planting which is in the fpring, ruft before they begin to push out new stalks. The other forts are propagated by feeds, but are fo tender as to require being kept constantly in a stove.

Properties. All the species of this plant abound with a milky juice, which flows out from any part of their stalks and leaves when they are broken: this is menerally supposed to be hurtful if taken inwardly, but toth not blifter the skin when applied to it as the juice of spurge and other acrid plants. The pods of all the forts are filled with feeds, which are for the most part compared and lie over one another imbricatim, like tiles and house; these have each a long plume of a compared down fastened to their crowns, by which, when pods are ripe and open, the feeds are wafted by the wind to a confiderable distance, so that the plants become very troublesome weeds. This down is in great efterm in France, for fluffing of easy chairs, making quilts, &c. for it is exceedingly light and elastic. It is called by the French delawad; and might probably a vendible commodity in England, were people attentive to the collecting of it in Jamaica where Apodects the plants are found in plenty.

APODECTÆ, in antiquity, a denomination given Apolinato ten general receivers appointed by the Athenians to receive the public revenues, taxes, debts, and the like. The apodectæ had also a power to decide controversies arising in relation to money and taxes, all but those of the most difficult nature and highest concern, which were referved to the courts of judicature.

APODECTÆI, in the Athenian government, officers appointed to fee that the measures of cornwere just.

APODES, in a general fense, denotes things without feet. Zoologists apply the name to a fabulous fort of birds, faid to be found in some of the islands of the New World, which, being entirely without feet, support themselves on the branches of trees by their crooked bills.

APODES, in the Linuxan system, the name of the first order of fishes, or those which have no belly fins. See Zoology.

APODICTICAL, among philosophers, a term importing a demonstrative proof, or fystematical method of teaching.

APODOSIS, in rhetoric, makes the third part of a complete exordium, being properly the application, or restriction of the protosis. The apodosis is the same with what is otherwise called axiosis; and stands opposed to protasis: e. g. protasis, all branches of history are necessary for a student; catefceue, so that, without these, he can never make any considerable sigure; apodosis, but literally history is of a more espe-

cial use, which recommends it, &c. APODYTERIUM, in the ancient baths, the apartments where persons dressed and undressed.

APOGEE, in ASTRONOMY, that point in the orbit of a planet which is at the greatest distance from the earth. The apogee of the fun is that part of the earth's orbit which is at the greatest distance from the sun; and confequently the fun's apogee, and the earth's aphelion, are one and the fame point.

APOLIDES, in antiquity, those condemned for life to the public works, or exiled into fome island, and thus divested of the privileges of Roman citizens.

APOLLINARIAN GAMES, in Roman antiquity, were inflituted in the year of Rome 542. The occafion was a kind of oracle delivered by the prophet Marcus after the fatal battle at Cannæ, declaring, that to expel the enemy, and cure the people of an infectious disease which then prevailed, sacred games were to be annually performed in honour of Apollo; the prætor to have the direction of them, and the decemviri to offer facrifices after the Grecian rite. The fenate ordered that this oracle should be observed the rather, because another of the same Marcus, wherein he had foretold the overthrow at Cannæ, had come true; for this reason they gave the prætor 12,000 ases out of the public cash to defray the solemnity. There were facrificed an ox to Apollo, as also two white goats, and a cow to Latona; all with their horns gilt. Apollo had also a collection made for him, besides what the people who were spectators gave voluntarily. The first prætor by whom they were held was P. Cornelius Sylla. For fome time they were moveable or indictive; but at length were fixed, under P. Licinius Varus, to the fifth of July, and made perpetual. The men, who were spectators at these games, wore garlands on their heads;

Apollina- the women performed their devotions in the temples at the same time, and at last they caroused together in the Apolimaris veltibules of their houses, the doors standing open. The Apollinarian games were merely scenical; and at first only observed with singing, piping, and other sorts of music; but afterwards there were also introduced all manner of mountebank tricks, dances, and the like: yet fo as that they still remained scenical, no chariot races, wreftling, or the like laborious exercifes of the body, being ever practifed at them.

APOLLINARIANS, Apollinarists, called alfo by Epiphanius Dimarita, ancient heretics, who denied the proper humanity of Christ, and maintained that the body which he affumed was endowed with a fensitive, and not a rational, soul, but that the Divine Nature supplied the place of the intellectual principle in man. This fect derived its name from Apollmaris,

bishop of Laodicea, in the fourth century.

The Apollinarians have been charged with other opinions, such as, the Millenarian and Sabellian, the pre-existence of the body of Christ, and the passion of his Deity; but ecclefiaftical writers are not agreed with respect to these and other particulars. Their doctrine was first condemned by a council of Alexandria in the year 362, and afterwards in a more formal manner by a council at Rome in 375; and by another council in 378, which depoted Apollinaris from his bishopric. Notwithstanding all, his doctrine spread through most of the churches of the east: and his followers were subdivided into various fects. In 388, the emperor Theodolius enacted a law, forbidding them to hold affemblies, to have any ecclefiaftics or bishops, or to dwell in cities. The rigorous execution of this law, in concurrence with the decrees of different councils, reduced them to a very small number, and their doctrine had no long duration.

ĂPOLLINARIS (Caius Sulpicius), a very learned grammarian, born at Carthage, lived in the 2d century, under the Antonines; he is supposed to be the author of the verfes which are prefixed to the comedies of Terence, and contain the arguments of them. He had for his fuccessor in the profession of grammar Helvius Pertinax, who had been his scholar, and was at last

emperor.

Apollinaris Sidonius (Chius Lollius), an eminent Christian writer and bishop in the 5th century, was born of a noble family in France. He was educated under the best masters, and made a prodigious progress in the several arts and sciences, but particularly in poetry and polite literature. After he had left the schools, he applied himself to the profession of war. He married Papianilla, the daughter of Avitus, who was conful, and afterwards emperor, by whom he had three children. But Majorianus in the year 457 having deprived Avitus of the empire, and taken the city of Lyons, in which our author refided, Apollinaris fell into the hands of the enemy. However the reputation of his learning foftened Majorianus's refentments, fo that he treated him with the utmost civility, in return for which Apollinaris composed a panegyric in his honour; which was fo highly applauded, that he had a statue erected to him at Rome, and was honoured with the title of Count. In the year 467 the emperor Anthemius rewarded him for the panegyric which he had written in honour of him, by raifing him to the post of

governor of Rome, and afterwards to the dignity of a Apellinapatrician and fenator, and erecting a flatue to him. But he foon quitted these secular employments for the fervice of the church. The bishopric of Clermont being vacant in 472 by the death of Eparchus, Apollinaris, who was then only a layman, was chosen to fucceed him without any interest or folicitation on his part, in which see he acted with the greatest integrify. Clermont being belieged by the Goths, he animated the people to the defence of that city, and would never confent to the furrender of it; fo that, when it was taken about the year 480, he was obliged to retire; but he was foon reftored by Evariges king of the Goths, and continued to govern the church as he had done before. He died in peace the 21st of August 437; and his festival is still observed in the church of Clermont, where his memory is had in great veneration. He is effeemed the most elegant writer of his age, both in profe and verfe. He wrote a great many little pieces; but preferved none but those which he thought were worthy of being continued down to posterity. He collected himself the nine books which we have remaining of his letters. His chief pieces in poetry are the three panegyrics upon the emperous Avitus, Majorianus, and Antheinius. The rest of them are a collection of poems addressed to his friends upon particular subjects. His letters contain a variety of particulars relating to polite literature and profane

APOLLINARIUS (Claudius), a learned bishop of Hierapolis, who, about the year 170, prefented to Marcus Aurelius an execulent Apology for the Chri-

Apollinarius the Younger, thus called to disting with him from his father, called Apollinarius the Elder, was at first lector or reader of Laudicea, and afterwards bishop of that city. He was univerfally effective ed the greatest man of his age, both for learning and picty, and a most accurate and nervous defender of the faith against all its enemics: but notwithstanding this, on his advancing fome opinions that were not approved, he was anathematized as an heretic by the fecond general council of Constantinople in 381.

APOLLO, in mythology, a Pagan deity worshipped by the Greeks and Romans. Cicero mentions four of this name: the most ancient of whom was the fon of Vulcan; the fecond a fon of Corybas, and bern in Crete; the third an Arcadian, called Nomian, from his being a great legislator; and the last, to whom the greatest honour is ascribed, the son of Jupiter and La-

Apollo had a variety of other names, either derived from his principal attributes, or the chief places where he was worshipped. He was called the Healer, from his enlivening warmth and cheering influence; Pwan, from the peltilential heats: to fignify the former, the ancients placed the Graces in his right hand; and for the latter, a bow and arrows in his left: Namius, or the shepherd, from his fertilizing the earth, and thence fustaining the animal creation: Delius, from his tendering all things manifest: Pythius, from his victory over Python; Lycias, Phabus, and Phaneta, from his purity and splendour. As Apollo is almost always confounded by the Greeks with the fun, it is no wonder that he should be dignified with so many attributes.

lt.

Apollo. It was natural for the most glorious object in nature, whose influence is felt by all creation, and seen by every animated part of it, to be adored as the fountain of light, heat, and life. The power of healing diseases being chiefly given by the ancients to medicinal plants and vegetable productions, it was natural to exalt into a divinity the visible cause of their growth. Hence he was also styled the God of Physic; and that external heat which cheers and invigorates all nature, being transferred from the human body to the mind, gave rife to the idea of all mental effervescence coming from

this god; hence, likewife, poets, prophets, and mu-

ficians, are faid to be Numine afflati, inspired by A-

pollo.

Whether Apollo was ever a real perfonage, or only the great luminary, many have doubted. Indeed, Voffius has taken great pains to prove this god to be only a metaphorical being, and that there never was any other Apollo than the fun. " He was flyled the Son of Jupiter (fays this author), because that god was reckoned by the ancients the author of the world. His mother was called Latona, a name which fignifies bidden: because, before the sun was created, all things were wrapped up in the obscurity of chaos. He is always represented as beardless and youthful, because the fun never grows old or decays. And what elfe can his bow and arrows imply, but his piercing beams?" And adds, " that all the ceremonies which were performed to his honour, had a manifest relation to the great fource of light which he represented. Whence (he concludes) it is vain to feek for any other divinity than the fun, which was adored under the name of Apollo." However, though this be in general true, yet it does appear, from many passages in ancient authors, that there was fome illustrious personage named Apollo, who, after his apotheofis, was taken for the fun; as Ofiris and Orus in Egypt, whose existence cannot be called in question, were, after their death, confounded with the fun, of which they became the fymbols, either from the glory and splendour of their reigns, or from a belief that their fouls had taken up their residence in that luminary.

Of the four Apollos mentioned by Cicero, it appears that the three last were Greeks, and the first an Egyptian; who, according to Herodotus, was the fon of Ofiris and Ifis, and called Orus. Paufanias is of the fame opinion as Herodotus, and ranks Apollo among the Egyptian divinities. The testimony of Diodorus Siculus is still more express; for in speaking of Isis, after saying that she had invented the practice of medicine, he adds, that she taught this art to her son Orus, named Apollo, who was the last of the gods that

reigned in Egypt.

It is easy to trace almost all the Grecian fables and mythologies from Egypt. If the Apollo of the Greeks was faid to be the fon of Jupiter, it was because Orus the Apollo of the Egyptians had Ofiris for his father, whom the Greeks confounded with Jupiter. If the Greek Apollo was reckoned the god of eloquence, mufic, medicine, and poetry, the reason was, that Osiris, who was the symbol of the sun among the Egyptians, as well as his fon Orus, had there taught those liberal prts. If the Greek Apollo was the god and conducof the Muses, it was because Osiris carried with him his expedition to the Indies finging women and muficians. This parallel might be carried on still further; Apollobut enough has been faid to prove that the true Apollo was that of Egypt.

To the other perfections of this divinity the poets have added beauty, grace, and the art of captivating the ear and the heart, no less by the sweetness of his cloquence, than by the melodious founds of his lyre. However, with all these accomplishments, he had not the talent of captivating the fair, with whose charms he was enamoured. But the amours and other adventures related of this god during his refidence on earth, are too numerous, and too well known, to be inferted here. His mufical contests, however, being more connected with the nature of this work, must not be whol-

ly unnoticed.

To begin, therefore, with the dispute which he had with Pan, that was left to the arbitration of Midas.

Pan, who thought he excelled in playing the flute, offered to prove that it was an instrument superior to the lyre of Apollo. The challenge was accepted; and Midas, who was appointed the umpire in this contest, deciding in favour of Pan, was rewarded by Apollo, according to the poets, with the ears of an afs for his stupidity .- This fiction seems founded upon history. Midas, according to Paulanias, was the fon of Goidius and Cybele; and reigned in the Greater Phrygia, as we learn from Strabo. He was possessed of such great riches, and fuch an inordinate delire of increasing them by the most contemptible parfiniony, that, according to the poets, he converted whatever he touched into gold. However, his talent for accumulation did not extend to the acquirement of talle and knowledge in the fine arts; and, perhaps, his dulness and mattention to these provoked some musical poets to invent. the fable of his decision in favour of Pan against Apollo. The scholiast upon Aristophanes, to explain the siction of his long ears, fays, that it was defigued to intimate that he kept spies in all parts of his dominions.

Marfyas, another player on the flute, was still more unfortunate than either Pan or his admirer Midas. This Marfyas, having engaged in a mufical dispute with Apollo, chose the people of Nisa for judges. Apollo played at first a simple air upon his instrument; but Marfyas, taking up his pipe, flruck the audience so much by the novelty of its tone, and the art of his performance, that he seemed to be heard with more pleasure than his rival. Having agreed upon a second trial of skill, it is said that the performance of Apollo, by accompanying the lyre with his voice, was allowed greatly to excel that of Marfyas upon the flute alone. Marsyas, with indignation, protested against the decision of his judges; urging that he had not been fairly vanquished according to the rules stipulated, because the dispute was concerning the excellence of their several instruments, not their voices; and that it was wholly unjust to employ two arts against one:

Apollo denied that he had taken any unfair advantages of his antagonist, since Marsyas had employed both his mouth and fingers in performing upon his instrument; so that, if he was denied the use of his mouth, he would be still more disqualified for the contention. The judges approved of Apollo's reasoning, and ordered a third trial. Mariyas was again vanquished; and Apollo, inflamed by the violence of the dispute, slea'd him alive for his prefumption. See MARSYAS.

Paulanias,

Paufanias relates a circumstance concerning this contest, that had been omitted by Diodorus, which is, that Apollo accepted the challenge from Mariyas, upon condition that the victor should use the vanquished as he pleased.

Diodorus informs us, that Apollo foon repenting of the cruelty with which he had treated Marlyas broke the strings of the lyre, and by that means put a stop, for a time, to any farther progress in the practice of that

new instrument.

The next incident to be mentioned in the history of

Apollo is his defeat of the serpent Python.

The waters of Deucalion's deluge, fays Ovid, which had overflowed the earth, left a flime from whence fprung innumerable monsters; and among others the ferpent Python, which made great havock in the country about Parnailus. Apollo, armed with his darts, put him to death; which physically explained, implies, that the heat of the fun having diffipated the noxious steams, these monsters soon disappeared; or if this sable be referred to history, the serpent was a robber, who haunting the country about Delphos, and very much infesting those who came thither to facrifice; a prince, who bore the name of Apollo, or one of the priests of that god, put him to death.

This event gave rife to the institution of the Pythian games, so frequently mentioned in the Grecian history; and it was from the legend of Apollo's victory over the Python that the god himfelf acquired the name of Pythius, and his priestess that of PYTHIA. The city of Delphos, where the famous oracles were fo long deli-

vered, was frequently flyled Pytho.

As Apollo was the god of the fine arts, those who cultivated them were called his fous. Of this number was Philaminon of Delphos, whom the poets and mythologists make the twin-brother of Autolychus, by the nymph Chione, and Apollo and Mercury. It is pretended that both these divinities were favoured by the nymph on the fame day, and that their fires were known from their different talents. Philammon, a great poet and musician, was reported to be the offspring of the god who prefides over those arts; and Autolychus, from the craftiness and subtilty of his disposition, was faid to have spring from Mercury, god of thest and fraud. Philammon is one of the first, after Apollo, upon fabulous record, as a vocal performer, who accompanied himfelf with the found of the lyre: his fon was the celebrated Thamyris. See THAMYRIS.

There can be no doubt but that Apollo was more generally revered in the Pagan world than any other deity; having, in almost every region of it, temples, oracles, and festivals, as innumerable as his attributes: the wolf and hawk were confecrated to him, as fymbols of his piercing eyes; the crow and the raven, because these birds were supposed to have by instinct the faculty of prediction; the laurel, from a persuasion that those who flept with some branches of that tree under their heads received certain vapours, which enabled them to prophefy. The cock was confecrated to him, because by his crowing he announces the rifing of the fun; and the grashopper on account of his finging faculty, which was supposed to do honour to the god of music. Most of the ancient poets have celebrated this tuneful insect, but none better than Anacreon, Ode xliii.

Plato fays that the grafshopper fings all fummer with-

out food, like those men who, dedicating themselves to Aprillo. the Muses, forget the common concerns of life.

The swan was regarded by the ancients as a bird sacred to Apollo in two capacities; first, as being, like the crow and raven, gifted with the spirit of prediction; and, fecondly, for his extraordinary vocal powers. The sweetness of his song, especially at the approach of death, was not only extolled by all the poets of antiquity, but by historians, philosophers, and fages; and to call a great writer the fwan of his age and nation, was a full acknowledgment of his sovereignty . See the article 4-Thus Horace calls Pindar the Theban fwan.

Plutarch, who was himself a priest of Apollo, im-nas. pressed with the highest respect and veneration for him and for music, in his dialogue upon that art, makes one of his interlocutors fay, that an invention fo useful and charming could never have been the work of man, but must have originated from some god, such as Apollo, the inventor of the flute and lyre, improperly attributed to Hyagnis, Marlyas, Olympus, and others; and the proofs he urges in support of this asfertion, show, if not its truth, at least that it was the common and received opinion.

All dances and facrifices, fays he, used in honom of Apollo, are performed to the found of flutes: the statue of this god at Delos, erected in the time of Hercules, had in its right hand a bow; and on the left flood the three Graces, who were furnished with three kinds of instruments; the lyre, the flute, and the fyrinx. The youth also who carries the laurel of Tempe to Delphos, is accompanied by one playing on the flute; and the facred presents formerly fent to Delos by the Hyperboreans, were conducted thither to the found of lyres, flutes, and shepherds pipes. He supports these facts by the testimonies of the poets Alcaus, Alcman, and Corinna.

It feems as if the account of Apollo could not be concluded by any thing that is left to offer on the fubject, so properly, as by part of the celebrated hymn of Callimachus, which during many ages was performed and heard by the most polished people on the globe with the utmost religious zeal, at the festivals instituted to this god.

Ha! how the laurel, great APOLLO's tree, And all the cavern, shakes! Far off, far off, The man that is unhallow'd: for the god Approaches. Hark! he knocks; the gates Feel the glad impulse; and the sever'd bars Submillive clink against their brazen portals Why do the Delian palms incline their boughs, Self mov'd; and hovering fwans, their throats releas'd From native filence, carol founds harmonious?

Begin, young men, the hymn: let all your harps Break their inglorious filence; and the dance, In mystic numbers trod, explain the music, But first, by ardent pray'r and clear lustration, Purge the contagious spots of human weakness: Impure, no mortal can behold Apollo. So may you flourish, favour'd by the god, In youth with happy nuptials, and in age
With filver hairs, and fair descent of children; So Ly foundations for aspiring cities, And blefs your spreading colonies increases

Pay facred rev'rence to Apollo's fong; Left watchful the far-shooting god emit His fatal arrows. Silent nature stands: And feas fubfide, obedient to the found Of lo! lo Pzan! nor dares Thetis Longer bewail her lov'd Achilles' death.

Apollo, Apollodorus For Phobus was his fee. Nor multiad Niobe Infruitles forrow persevere, or weep, Even thro' the Phrygian marble. If pless mether! Whose foundes could compare her mortal offspring To those which fair Latona bore to Jove. lo! again repeat ye, lo Paran!

Pecite Apollo's praife till night draws on,
The ditty ftill unfinith'd; and the day
Unequal to the godhead's attributes
Various, and matter cepious of your fongs.
Sublume at Jove's right hand Apollo fits,
And thence diftributes honour, gracious king,
And theme of verfe perpetual. From his robe
Flows light ineffable! his harp, his quiver,
And Lactan bow, are gold: with golden fandals
His fect are fhod. How rich! how beautiful!
Beneath his fteps the yellow min'ral rifes;
And earth reveals her treasures. Youth and beauty
Eternal deck his cheek: from his fair head
Perfumes distil their sweets; and cheerful health,
His duteous hand-maid, through the air improv'd
With lavish hand distuses feests ambrofial.

The spearman's arm by thee, great god, directed, Sends forth a certain wound. The laurel'd bard, Inspir'd by thee, composes verse immortal Taught by thy art divine, the sage physician Eludes the urn, and chains or exiles death.

The monstrous Python
Durst tempt thy wrath in vain; for dead he fell,
To thy great strength and golden arms unequal.

Io! while thy unerring hand elanc'd
Another and another dart, the people
Joyfully repeated Io! Io Pean!
Elance the dart, Apollo; for the safety
And health of man, gracious thy mother bore thee!

APOLLO Belvidere, one in the first class of the ancient statues. The excellence of this statue consists in the expression of something divine, whereas the rest excel only in things that are common to men. This statue may perhaps justly enough claim the preference, even in the superior and distinguished class of the best remains of all antiquity. There are about twenty ancient statues which the moderns have discovered that are referred to the first class, and considered each as the chief beauty in its kind.

APOLLODORUS, born at Damascus, a famous architect under Trajan and Hadrian. He had the direction of the bridge of stone which Trajan ordered to be built over the Danube in the year 104, which was esteemed the most magnificent of all the works of that emperor. Hadrian, one day as Trajan was discoursing with this architect upon the buildings he had raised at Rome, would needs give his judgment, and showed he understood nothing of the matter. Apollodorus turned upon him bluntly, and said to him, Go paint citruls, for you are very ignorant of the subject we are talking upon. Hadrian at this time boasted of his painting citruls well. This infult cost Apollodorus his life.

APOLLODORUS, a celebrated painter of Athens, about 408 years before the birth of Christ, was the first who invented the art of mingling colours, and of expressing the lights and shades. He was admired also for his judicious choice of subjects, and for the beauty

and strength of colouring surpassed all the masters that Apollodowent before him. He excelled likewise in statuary.

Apolloborus the Athenian, a famous grammarian, the fon of Afelepiades and disciple of Aristarchus. He wrote many works not now extant: but his most famous production was his Bibliotheca, concerning the origin of the gods. This work consisted of 24 books, but only three are now in being. Several other pieces of his are to be found in Fabricius's Bibliotheca Graea. There were various other pesons of this name. Scipio Testi, a Neapolitan, has written a treatise of the Apollodoruses, which was printed at Rome in 1555; and Dr Thomas Gale published a work of the same kind in 1675.

APOLLONIA, the name of several ancient cities, particularly of a colony of the Milesians in Thrace, from which Lucullus took away a colossus of Apollo, and placed it in the capitol. The greatest part of the town was situated in a small island on the Euxine, in which was a temple of Apollo (Strabo). Pliny says the colossus was 30 cubits high, and cost 500 talents. There was also an Apollonia at Mount Parnassus, near Delphi. (Stephanus). Troczen was formerly called Apollonia.

APOLLONIA, feafts facred to Apollo, inflituted upon the following occasion. Apollo, having vanquished Python, went with his sister Diana to Ægialea; but, being driven from thence, he removed to the island Crete. The Ægialeans were soon after visited with a plague; upon which, consulting the soothsayers, they were ordered to send seven young men and as many virgins, to appease those deities and bring them back into their country. Apollo and Diana being thus appeased, returned to Ægialea; in memory of which, they dedicated a temple to Pitho, the goddess of perfuasion; whence a custom arose of choosing every year seven young men, and as many virgins, to go as it were in search of Apollo and Diana.

APOLLONIA, in geography, a promontory of Africa, upon the coast of Guinea, near the mouth of the river Mancu.

APOLLONIUS, the author of the Argonautics, and furnamed The Rhodian, from the place of his refidence, is supposed to have been a native of Alexandria, where he is faid to have recited some portion of his poem while he was yet a youth. Finding it ill received by his countrymen, he retired to Rhodes; where he is conjectured to have polished and completed his work, supporting himself by the profession of rhetoric, and receiving from the Rhodians the freedom of their city. He at length returned, with confiderable honour, to the place of his birth; fucceeding Eratosthenes in the care of the Alexandrian library in the reign of Ptolemy Euergetes, who ascended the throne of Egypt the year before Christ 246. That prince had been educated by the famous Aristarchus, and rivalled the preceding fovereigns of his liberal family in the munificent encouragement of learning. Apollonius was a disciple of the poet Callimachus; but their connexion ended in the most violent enmity, which was probably owing to some degree of contempt expressed by Apollonius for the light compositions of his master. The learned have vainly endeavoured to discover the particulars of their quarrel.—The only work of Apollonius which has descended to modern times is his poem above mentioned, in four books, on the Argonautic expedition.

andria, who came to Ephesus during the absence of Apollyon,

Apollonius, expedition. Both Longinus and Quintilian have af-Apollos. figned to this work the mortifying character of mediocrity: " But (fays Mr Hayley) there lies an appeal from the fentence of the most candid and enlightened critics to the voice of Nature; and the merit of Apollonius has little to apprehend from the decision of this ultimate judge. His poems abound in animated description, and in passages of the most tender and pathetic beauty. How finely painted is the first fetting forth of the Argo! and how beautifully is the wife of Chiron introduced, holding up the little Achilles in her arms, and showing him to his father Peleus as he failed along the shore! But the chief excellence in our poet, is the spirit and delicacy with which he has de-Inneated the passion of love in his Medea. That Virgil thought very highly of his merit in this particular, is fufficiently evident from the minute exactness with which he has copied many tender touches of the Grecian poet. Those who compare the third book of Apollonius with the fourth of Virgil, may, I think, perceive not only that Dido has some features of Medea, but that the two bards, however different in their reputation, resembled each other in their genius; and they both excel in delicacy and pathos."-The ancient scholia upon his Argonautics, still extant, are extremely useful, and full of learning.

> Apollonius, of Perga, a city of Pamphylia, was a great geometrician, under the reign of Ptolemy Eucrgetes, which reaches from the 2d year of the 133d Olyinpiad to the 3d year of the 139th. He studied a long time at Alexandria, under the disciples of Euclid; and composed several works, of which that only of the Conics remains.

> Apollonius, a Pythagorean philosopher, born at Tyana in Cappadocia, about the beginning of the first century. At 16 years of age he became a strict obferver of Pythagoras's rules, renouncing wine, women, and all forts of fleth; not wearing shoes, letting his hair grow, and wearing nothing but linen. He foon after let up for a reformer of mankind, and chose his habitation in a temple of Æsculapius, where he is faid to have performed many wonderful cures. Philostratus has wrote the life of Apollonius, in which there are numberless fabulous stories recounted of him. We are told that he went five years without speaking; and yet, during this time that he stopped many feditions in Cilicia, and Pamphylia: that he travelled, and fet up for a legislator; and that he gave out he understood all linguages, without having ever learned them: that he could tell the thoughts of men, and understood the oracles which birds gave by their finging. The Heathens were fond of oppoing the pretended miracles of this man to those of our Saviour; and by a treatise which Eusebius wrote against one Hierocles, we find that the drift of the latter, in the treatife which Eufebius refutes, seems to have been to draw a parallel betwixt Jefus Christ and Apollonius, in which he gives the preference to this philosopher. M. du Pin has wrote a confutation of Philostratus's life of Apollo-

> Apollonius wrote some works, viz. four books of judicial astrology; a treatife upon the facrifices, showing what was proper to be offered to each deity; and a great number of letters; all of which are now loll.

APOLLOS, in Scripture history, a Jew of Alex-

St Paul, who was gone to Jerusalem (Acts xviii. 24.) Apologetic. Apollos was an eloquent man, and well versed in the Scriptures; and as he spoke with zeal and fervour, he taught diligently the things of God: but knowing only the baptism of John, he was no more than a catechumen, or one of the lowest order of Christians, and did not as yet distinctly know the mysteries of the Christian doctrine. However, he knew that Jesus Christ was the Messiah, and declared himself openly to be his disciple. When therefore he was come to Ephelus, he began to speak boldly in the synagogue, and to show that Jesus was the Christ. Aquila and Priscilla having heard him, took him home with them; instructed him more fully in the ways of God; and baptized him, probably in the name of Jesus Christ.

Some time after this he had a mind to go into Achaia; and the brethren having exhorted him to undertake this journey, they wrote to the disciples, defiring them to receive him. He arrived at Corinth; and was there very useful in convincing the Jews out of the Scriptures, and demonstrated to them that Jesus was the Christ. Thus he watered what St Paul had planted in this city (1 Cor. iii. 6.) but the great fondness which his disciples had for his person had like to have produced a schism; some "faying, I am of Paul; others, I am of Apollos; I am of Cephas.". However, this division which St Paul speaks of in the chapter last quoted, did not prevent that apostle and Apollos from being closely united by the bands of charity. Apollos hearing that the apostle was at Ephesus, went to meet him, and was there when St Paul wrote the first epific to the Corinthians; wherein he testisces that he had earneslly entreated Apollos to return to Corinth, but hitherto had not been able to prevail with him; that, nevertheless, he gave him room to hope that he would go when he had an opportunity. St Jerome fays, that Apollos was so dislatisfied with the division which had happened upon his account at Corinth, that he retired into Crete with Zena, a doctor of the law; and that this diffurbance having been appealed by the letter which St Paul wrote to the Cormthians, Apollos returned to this city, and was bishop thereof. The Greeks make him bahop of Duras; others fay, he was bithop of Iconium in Phrygia; and others, that he was bishop of Clefarea.

APOLLYON, a Greek word that fignifies the destroyer, and answers to the Hebrew Abaddon. St John in the Revelation (ix. 11.) fays, that an angel having opened the bottomless pit, a thick smoke issued out of it; and with this smoke locusts, like horses, prepared for battle, and commanded by the angel of the bottomless pit, called in Hebrew Abaddon, but in the

Greek Apollyon.

APOLOGETIC, APOLOGETICAL, fomething faid or written, by way of excuse or apology, for any ac-

tion or person.

The Apologetic of Tertullian is a work full of strength and spirit. He there vindicates the Christians from all that had been objected to them; particularly from the abominable crimes faid to be perpetrated at their meetings, and their want of love and fidelity to their country. The ground of this last accusation was, their refusing to take the accustomed oaths, and swear by the tutelar gods of the empire. Tertullian ad-

Apologue dreffes his Apologetic to the magistrates of Rome, the emperor Severus being then absent.

> APOLOGUE, in matters of literature, an ingenious method of conveying instruction by means of a

feigned relation called a moral fable.

The only difference between a parable and an apologue is, that the former, being drawn from what pasfee among mankind, requires probability in the narration; whereas the apologue, being taken from the supposed actions of brutes, or even of things inanimate, is not tied down to the first rules of probability. Æsop's fubles are a model of this kind of writing.

APOLOGY, a Greek term, literally importing an

excuse or defence of some person or action.

APOMELI, among ancient physicians, a decoction of honey and vinegar, much used as a detergent,

promoter of flool, urine, &c.

APOMYOS DEUS, (are, and una, fly), in the Heathen mythology, a name under which Jupiter was worshipped at Elis, and Hercules as well as Jupiter at the Olympic games. These deities were supplicated under this name, to destroy or drive away the vast number of flies which always attended at the great facrifices; and in those which accompanied the Olympic games, the first was always to the Apomyos, or Myiagrus Deus, that he might drive away the flies from the rest. The usual facrifice was a bull.

APONEUROSIS, among physicians a term sometimes used to denote the expansion of a nerve or tendon in the manner of a membrane; fometimes for the cutting off a nerve; and, finally, for the tendon it-

APONO (Peter d'), one of the most famous philosophers and physicians of his age, born in the year 1250, in a village about four miles from Padua. He studied fome time at Paris, and was there promoted to the degree of doctor in philosophy and physic. When he came to practife as a physician, he is said to have insisted on very large sums for his visits: we are not told what he demanded for the vifits he made in the place of his residence; but it is affirmed, that he would not attend the fick in any other place under 150 florins a-day; and when he was fent for by Pope Honorius IV. he demanded 400 ducats for each day's attendance. He was fuspected of magic, and prosecuted by the Inquisition on that account. "The common opinion of almost all authors (fays Naude) is, that he was the greatest magician of his age; that he had acquired the knowledge of the seven liberal arts, by means of the seven familiar spirits, which he kept enclosed in a crystal; and that he had the dexterity to make the money he had fpent come back into his purse." fame author adds, that he died before the process against him was finished, being then in the 80th year of his age; and that, after his death, they ordered him to be burnt in effigy, in the public place of the city of Padua; defigning thereby to strike a fear into others of incurring the like punishment; and to suppress the reading three books which he had wrote; the first being the Heptameron, which is printed at the end of the first volume of Agrippa's work; the second, that which is called by Trithemius, Elucidareum necromanticum Petri de Albano; and the last, that which is entitled by the same author, Liber experimentorum

mirabilium de annulis secundum xxviii. mansiones luna. Aponogo-His body being fecretly taken up by his friends, escaped the vigilance of the inquifitors, who would have burnt it. It was removed feveral times, and was at Apophyge. last placed in the church of St Augustin, without an epitaph or any mark of honour. The most remarkable book which Apono wrote, was that which procured him the furname of Conciliator; he wrote also a piece entitled De medicina omnimoda. There is a story told of him, that, having no well in his house, he caused his neighbour's to be carried into the street by devils, when he heard they had forbidden his maid fetching water there. He had much better (fays Mr Bayle) have employed the devils to make a well in his own house, and have stopped up his neighbour's; or, at least, transported it into his house, rather than into the

APONOGETON: A genus of the digynia order, belonging to the heptandria class of plants, which has no English name. The calyx is an oblong omentum; there is no corolla; and the capfulæ are three-feeded. There are two species, natives of the Indies.

APONUS, a hamlet near Patavium, with warm baths. It was the birth-place of Livy, (Martial); and is now

called Albano. E. Long. 10. Lat. 45. 15.
APOPEMPTIC, in the ancient poetry, a hymn addressed to a stranger on his departure from a place to his own country. The ancients had certain holidays, wherein they took leave of the gods with apopemptic fongs, as supposing them returning each to his own country. The deities having the patronage of divers places, it was but just to divide their presents, and allow fome time to each. Hence it was, that among the Delians and Milefians we find feafts of Apollo, and among the Argians fealts of Diana, called Epidemia, as supposing these deities then more peculiarly resident among them. On the last day of the feast they dismissed them, following them to the alters with apopemptic hymns.

APOPHASIS, a figure in rhetoric, by which the orator, speaking ironically, seems to wave what he would plainly infinuate: as, Neither will I mention those things; which, if I should, you notwithstanding could nei-

ther confute, nor speak against them.

APOPHLEGMATIZANTS, in pharmacy, medicines proper to clear the head from superstuous phlegm,

whether by spitting or by the nose.

APOPHTHEGM, a short, sententious, and instructive remark, pronounced by a person of distinguished character. Such is that of Cyrus: He is unworthy to be a magistrate, who is not better than his subjects. Or this: He that will not take care of his own business, will be forced to take care of that of others. Or that of Artaxerxes Mnemon, when reduced to hunger by the lofs of his baggage: How much pleasure have I hitherto lived a stranger to? Or that of Cato, Homines nibil agendo discunt male agere. Or, finally, that of Augustus, Festina lente. The apophthegms of Plutarch are well known.

APOPHYGE, in architecture, a concave part or ring of a column, lying above or below the flat member. The French call it le conge d'en bas, or d'en haut : the Italians, cavo di baffo, or di fopra; and also il vivo di basso. The apophyge originally was no more than

the

Apophysis the ring, or ferril, at first fixed on the extremities of Apollaly. wooden pillars, to keep them from splitting; which afterwards was imitated in flone.

APOPHYSIS, in anatomy, a process or protube-

rance of a bone. See Anatomy.

APOPLEXY, a difference in which the patient is fuddenly deprived of all his fenses, and of voluntary motion. See MEDICINE, Index.

APORIA, is a figure in rhetoric, by which the speaker shows, that he doubts where to begin for the multitude of matter, or what to fay in some strange and ambiguous thing; and doth, as it were, argue the cafe with himself. Thus Cicero fays, Whether he took them from his fellows more impudently, gave them to a harlot more lastiviously, removed them from the Roman people more wickedly, or altered them more presumptuously, I cannot well declare.

APORON, or Aporime, a problem difficult to refolve, and which has never been refolved, though it be not, in itself, impossible.

The word is derived from axogos, which fignifies fomething very difficult, and impracticable; being formed from the privative a and moess, passage. Such we conceive the quadrature of the circle; the duplicature of the cube; the trifection of an angle, &c. When a question was proposed to any of the Greek philosophers, especially of the sect of Academills; if he could not give a folution, his answer was, A mogiu, I cannot fee through it.—This word is also used by some law writers for an inexplicable speech or discourse.

APOSIOPESIS, in rhetoric, otherwise called reticency, and suppression; a figure, by which a person really speaks of a thing, at the same time that he makes a show as if he would fay nothing of it. The word comes from anorman, I am filent .- It is commonly used to denote the same with ELLIPSIS. Jul. Scaliger diftinguishes them. The latter, according to him, being only the suppression of a word; as, me, me; adfum qui feci; the former, the omitting to relate some part of the action; as,

Dixerat, atque illam media inter talia ferro Collapfam adfpiciunt-

where the poet does not mention how Dido killed herfelf.—This figure is of use to keep up the grandeur and fublimity of a discourse.

APOSPHRAGISMA, (from exo, and openyign, I fral), in antiquity, the figure or impression of a seal .-It was forbid among the ancients to have the figure or image of God on their rings and feals. To this purpose the precept of Pythagoras, Er dantulin theora Oir un πιριφερεν! But in process of time, this was little regarded; it was usual enough to have the figures of Egyptian and other deities, as well as of heroes, mon-iters, friends, ancestors, and even brutes, on their daetyli, or ring-seals. Thus Cæsar had the image of Venus, Pollio of Alexander, Augustus of the Sphins, Pompey of a frog, Lentulus of his grandfather, &c.

APOSTASIS, in medicine, the fame with abfcefs. APOSTASY, the abandoning the true religion. The primitive Christian church distinguished several kinds of apostaly. The first, of those who went over entirely from Christianity to Judaism; the second, of those who mingled Judaism and Christianity together; Vol. II. Part I.

and the third, of those who complied so far with the Apostaly Iews, as to communicate with them in many of their unlawful practices, without making a formal profession Apostue. of their religion. But the fourth fort was of those who, after having been some time Christians, voluntarily relapfed into Paganism.

The perversion of a Christian to Judaism, Paganism, or other falle religion, was punished by the emperors Constantius and Julian with confiscation of goods; to which the emperors Theodosius and Valentinian added capital punishment, in case the apostate endeavoured to pervert others to the same iniquity: A punishment too fevere for any temporal laws to inflict; and yet the zeal of our ancestors imported it into this country; for we find by Bracton, that in his time apostates were to be burnt to death. Doubtless the preservation of Christianity, as a national religion, is, abstracted from its own intrinsic truth, of the utmost consequence to the civil state: which a single instance will sufficiently demonstrate. The belief of a future state of rewards and punishments, the entertaining just ideas of the moral attributes of the supreme Being, and a firm persuation that he superintends and will finally compensate every action in human life (all which are clearly revealed in the doctrines, and forcibly inculcated by the precepts, of our Saviour Christ), these are the grand soundation of all judicial oaths: which call God to witness the truth of those facts, which perhaps may be only known to him and the party attelling: all moral evidence therefore, all confidence in human veracity, must be weakened by apollafy, and overthrown by total infidelity. Wherefore all affroits to Christianity, or endeavours to depreciate its efficacy, in those who have once professed it, are highly deferving of centure. But yet the lofs of life is a heavier penalty than the offence, taken in a civil light, deferves; and, taken in a spiritual light, our laws have no jurifdiction over it. This punishment, therefore, has long ago become obfolete; and the offence of apostasy was for a long time the object only of the ecclefiaffical courts, which corrected the offender pro falute anima. But about the close of the last century, the civil liberties to which we were then restored being used as a cloak of maliciousness, and the most horrid doctrine subversive of all religion beng publicly avowed both in discourse and writings, it was thought necessary again for the civil power to interpose, by not admitting those miscreants to the privileges of fociety, who maintained fuch principles as destroyed all moral obligation. To this end it was enacted, by statute 9 and 10 W. III. c. 32. That if any person educated in, or having made profession of, the Christian religion, shall by writing, printing, teaching, or advised speaking, deny the Christian religion to be true, or the holy Scriptures to be of divine authority, he shall upon the first offence be rendered incapable to hold any office or place of trust; and, for the second, he rendered incapable of bringing any action, or of being guardian, executor, legatee, or purchaser of lands, and shall suffer three years imprisonment without bail. To give room, however, for repentance, if, within four months after the first conviction, the delinquent will in open court publicly renounce his error, he is discharged for that once from all disabilities.

APOSTATE, one who deferts his religion. Among

Appliata the Romanists, it figuifies a man who, without a legal dispensation, forfakes a religious order of which he had made profession. Hence,

> APOSTATA CAPIENDO, in the English law, a writ that formerly lay against a person who, having entered into fome order of religion, broke out again, and wandered up and down the country.

A POSTERIORI, or demonstration à posteriori.

Sec Demonstration.

APOSTIL, in matters of literature, the same with

a marginal note.

APOSTLE properly fignifies a meffenger or perfon feat by another upon some business; and hence, by way of eminence, denotes one of the disciples commissioned

by Jesus Christ to preach the gospel.

Our bleffed Lord felected twelve out of the number of his disciples to be invested with the apostleship. Their names were Simon Peter, Andrew, James the greater, John, Philip, Bartholomew, Thomas, Matthem, James the less, Jude surnamed Lebbous or Thaddeus, Simon the Canaanite, and Judas Iscariot. Of these Simon, Andrew, James the greater, and John, were fishermen; and Matthew a publican, or receiver of the public revenues: of what profession the rest were, we are not told in Scripture; though it is probable they were fishermen.

There are various conjectures as to the reason of our Saviour's making choice of twelve apostles. The most probable is, that it might be in allusion to the twelve patriarchs, as the founders of their feveral tribes; or to the twelve chief heads or rulers of those tribes, of which the body of the Jewish nation consisted. This opinion feems to be countenanced by what our Saviour tells his apossles, that " when the Son of man shall sit on the throne of his glory, they also shall sit upon twelve thrones judging the twelve tribes of Ifrael."

Our Lord's first commission to his apostles was in the third year of his public ministry, about eight months after their folemn election; at which time he fent them out by two and two. They were to make no provifion of money for their subfishence in their journey, but to expect it from those to whom they preached. They were to declare, that the kingdom of heaven, or the Messiah, was at hand; and to confirm their doctrine by miracles. They were to avoid going either to the Gentiles or to the Samaritans, and to confine their preaching to the people of Ifrael. In obedience to their Master, the apostles went into all the parts of Palestine inhabited by the Jews, preaching The evangelical the gospel, and working miracles. hiltory is filent as to the particular circumstances attending this first preaching of the apostles; and only informs us, that they returned, and told their Master that they had done.

Their fecond commission, just before our Lord's ascension into heaven, was of a more extensive and particular nature. They were now not to confine their preaching to the Jews, but to "go and teach ALL nations, baptizing them in the name of the Father, and of the Son, and of the Holy Ghoft." Accordingly they began publicly, after our Lord's afcension, to exercife the office of their ministry, working miracles daily in proof of their mission, and making great numbers of converts to the Christian faith. This alarmed hthe Jewish Sanhedrim; whereupon the apostles were apprehended, and, being examined before the high Apostle. priest and elders, were commanded not to preach any more in the name of Christ. But this injunction did not terrify them from perfishing in the duty of their calling; for they continued daily, in the temple, and in private houses, teaching and preaching the gospel.

After the apostles had exercised their ministry for twelve years in Palestine, they resolved to disperse themselves in different parts of the world, and agreed to determine by lot what parts each should take. According to this division, St Peter went into Pontus, Galatia, and those other provinces of the Lesser Asia. St Andrew had the vast northern countries of Scythia and Sogdiana allotted to his portion. St John's was partly the same with Peter's, namely the Lesser Asia. St Philip had the Upper Asia affigued to him, with fome parts of Scythia and Colchis. Arabia Felix fell to St Bartholomew's share. St Matthew preached in Chaldaa, Persia, and Parthia. St Thomas preached likewise in Parthia; as also to the Hyrcanians, Bactrians, and Indians. St James the less continued in Jerusalem, of which church he was bishop. St Simon had for his portion Egypt, Cyrene, Libya, and Mauritania; St Jude, Syria and Melopotamia; and St Matthias, who was chosen in the room of the traitor Judas, Cappadocia and Colchis. Thus, by the dispersion of the apostles, Christianity was very early planted in a great many parts of the world. We have but very short and imperfect accounts of their travels and actions.

In order to qualify the apostles for the arduous task of converting the world to the Christian religion, they were, in the first place, miraculously enabled to speak the languages of the feveral nations to whom they were to preach: and, in the fecond place, were endowed with the power of working miracles, in confirmation of the doctrines they taught; gifts which were unneceffary, and therefore ceased, in the after ages of the church, when Christianity came to be established by

the civil power.

St Paul is frequently called the apoflle, by way of eminence; and the apostle of the Gentiles, because his ministry was chiefly made use of for the conversion of the Gentile world, as that of St Peter was for the Jews, who is therefore flyled the apostle of the circum-The feveral apostles, are usually represented with their respective badges or attributes; St Peter with the keys; St Paul with a fword; St Andrew with a cross or saltier; St James minor with a fuller's pole; St John with a cup, and winged ferpent flying from it; St Bartholomew with a knife; St Philip with a long staff, whose upper end is formed into a cross; St Thomas with a lance; St Matthew with a hatchet; St Matthias with a battle-axe; St James major with a pilgrim's staff and a gourd bottle; St Simon with a faw; and St Jude with a club.

This appellation was also given to the ordinary travelling ministers of the church .- Thus St Paul, in the Epistle to the Romans, xvii. 7. says, " Salute Andronicus and Junia, my kinfmen and fellow prifoners, who are of note among the apostles." It was likewise a title given to those sent by the churches to carry their alms to the poor of other churches. This usage they borrowed from the fynagogues, who called those whom they fent on this message by the same name; and the

function

Aposle. function or office itself anoson, aposle, q. d. mission.

Thus St Paul, writing to the Philippians, tells them that Epaphroditus their aposle had ministred to his wants, ch. ii. 25.

The appellation is given in like manner to those perfons who first planted the Christian faith in any place. Thus Dionysius of Corinth is called the aposse of France; Xavier, the aposse of the Indies, &c. In the East Indies the Jesuit missionaries are also called a-

postles

Apostle is also used among the Jews for a kind of officer anciently sent into the several parts and provinces in their jurisdiction, by way of visitor or commissary, to see that the laws were duly observed, and to receive the monies collected for the reparation of the temple, and the tribute payable to the Romans. The Theodosian code, lib. 14. De Judeis, calls those apostoli, qui ad exigendum aurum atque argentum á patriarcha certo tempore diriguntur. Julian the apostate remitted the Jews the apostle, aroson; that is, as he himself explains it, the tribute they had been accuflomed to fend him. These apostles were a degree below the officers of the fynagogues called patriarchs, and received their commissions from them. Some authors observe, that St Paul had borne this office; and that it is this he alludes to in the beginning of the epistle to the Galatians: as if he had faid, Paul, no longer an apostle of the synagogue, nor sent thereby to maintain the law of Moses, but now an apostle and envoy of Jesus Christ, &c. St Jerome, though he does not believe that St Paul had been an apostle of this kind, yet imagines that he alludes to it in the passage just cited.

APOSTLE, in the Greek liturgy, is particularly used for a book containing the epistles of St Paul, printed in the order wherein they are to be read in churches, through the course of the year. Another book of the like kind, containing the Gospels, is called Evasystor, Gospel.—The apostle, of late days, has also contained the other canonical epistles, the acts of the Apostles, and the Revelation. Hence it is also called Alls of the Apostles, negativesodos; that being the sirit

book in it.

Apostle is also thought by many to have been the original name for bishops, before the denomination bishop was appropriated to their order. Thus Theodoret says expressly, the same persons were anciently called promiscuously both bishops and presbyters, whilst those who are now called bishops were called apossles. In the arsenal of Bremen, there are twelve pieces of cannon called the Twelve Apossles, on a supposition that the whole world must be convinced, and acquiesce in

the preaching of fuch apostles.

Arostles Creed: A formula, or summary of the Christian saith, drawn up, according to Russiaus, by the apostles themselves: who, during their stay at Jerusalem, soon after our Lord's ascension, agreed upon this creed, as a rule of saith, and as a word of distinction by which they were to know friends from soes. Baronius, and some other authors, conjecture, that they did not compose it till the second year of the reign of Claudius, a little before their dispersion. As to their manner of composing it, some sancy, that each apostle pronounced his article, which is the reason of us being called symbolum apostolicum, it being made up

of fentences jointly contributed, after the manner of Ap the perfons paying each their club (fymbolum) or share of a reckoning.

Apostolate.

But there are reasons which may induce us to question whether the apostles composed any such creed as this. For, first. Neither St Luke in the Acts. nor any other ecclefiaftical writer before the 5th century, make any mention of an affembly of the apostles in order to the composing of a creed. Secondly, The fathers of the three first centuries, in disputing a gainst the herctics, endeavoured to prove that the doctrine contained in this creed was the same which the apostles taught; but they never pretend that the apostles composed it. Thirdly, If the apostles had made this creed, it would have been the same in all churches, and in all ages; and all authors would have cited it after the same manner. But the case is quite otherwise. In the second and third ages of the church, there were as many creeds as authors, and one and the same author sets down the creed after a different manner in several places of his works; which is an evidence that there was not at that time any creed which was reputed to be the apostles. In the 4th century, Russianus compares together the three ancient creeds of the churches of Aquileia, Rome, and the East, which differ very confiderably in the terms. Befides, thefe creeds differed not only in the terms and expressions, but even in the articles, fome of which were omitted in one or other of them; fuch as those of the descent into hell, the communion of the faints, and the life everlafling. From these reasons it may be gathered, that though this creed may be faid to be that of the apostles in regard to the doctrines contained therein, yet it is not to be referred to them as the authors and first composers of it. Who was the true author of it, is not so easy to determine; though its great antiquity may be inferred from hence, that the whole form, as it now stands in the English liturgy, is to be found in the works of St Ambrose and Ruffinus, the former of whom flourished in the 3d century, and the latter in the 4th century.

The primitive Christians, in regard they always concealed this and their other mysteries, did not publicly recite the creed, except at the times of baptism; which, unless in cases of necessity, were only at Easter and Whitsuntide. The constant repeating it was not introduced into the church till the end of the 5th century; about which time Petrus Guapheus, bishop of Antioch, prescribed the recital of it every time divine service was performed.

APOSTOLARE, APOSTOLICARE, apostolizing, in some middle age writers, denotes the being preferred to the dignity of pope.

APOSTÓLATE, in a general fense, is used for mission. In this fense, Olearius has a discourse con-

cerning the apostolate of Christ.

APOSTOLATE more properly denotes the dignity or office of an apostle of Christ; but it is also used, in ancient writers, for the office of a bishop. In this sense we meet with several letters, petitions, requests, &c. directed to bishops, under the title of your apostolate, or apostolates vester. But as the title apostolicus had been appropriated to the pope, so that of apostolate became at length restrained to the sole dignity of the popedom. Every bishop's see was anciently dignished with the title of seds apostolica, an apostolical

ce,

A postolici.

**postoli see, which is now the peculiar denomination of the see of Rome.

APOSTOLI, in law, denote those letters missive

which are demanded in cases of appeal.

APOSTOLIC, APOSTOLICAL, fomething that relates to the apostles, or descends from them. Thus we fay, the apostolical age, apostolical doctrine, apostolical character, constitutions, traditions, &c.

Apostolic, in the primitive church, was an appellation given to all fuch churches as were founded by the apollies; and even to the bishops of those churches, as being the reputed successors of the apostles .- These were confined to four, viz. Rome, Alexandria, Antioch, and Jerusalem. In after times, other churches affumed the same quality, on account, principally, of the conformity of their doctrine with that of the churches which were apostolical by foundation, and because ail bishops held themselves successors of the apostles, or acted in their dioceses with the authority of apostles.

The first time the term apostolical is attributed to bishops, as fuch, is in a letter of Clovis to the council of Oileans, held in 511, though that king does not there expressly denominate them apostolical but (apofolica fede digniffini) highly worthy of the apostolical fee. In 581, Guntram calls the bishops, met at the council of Maçon, apoflolical pontiss, apoflolici pontifiers.

In progress of time, the bishop of Rome growing in power above the rest, and the three patriarchates of Alexandria, Antioch, and Jerufalem, falling into the hands of the Saracens, the title apollolical was restrained to the pope and his church alone. Though fome of the popes, and St Gregory the Great, not contented to hold the title by this tenure, began, at length, to infift, that it belonged to them by another and pecuhar right, as being the fuccessors of St Peter. country of Rheims in 1049 declared that the pope was the fole apostolical primate of the universal church. And hence a great number of apostolicals; apostolical see, apostolical nuncio, apostolical notary, apostolical brief apostolical chamber, apostolical vicar, &c.

APOSTOLICAL Constitutions. See Constitution. APOSTOLICAL Traditions. See TRADITION.

APOSTOLICAL Fathers is an appellation usually given to the writers of the first century who employed their pens in the cause of Christianity. Of these writers, Cotelerius, and after him Le Clerc, have published a collection in two volumes, accompanied both with their own annotations and the remarks of other learned

APOSTOLIANS, a feet of the Mennonites, which first sprung up in the year \$664, and derived its name from Apostool, one of the Mennouite ministers at Amsterdam. They concurred with them in doctrine, and admitted to their communion those only who professed to believe all the fentiments which are contained in their public confession of faith.

APOSTOLICÍ, or Arostolics, was a name affumed by three different fects, on account of their pretending to imitate the manner and practice of the apo-The first apostolici, otherwise called Apotastita and Apotattici, rose out of the Encratitæ, and Cathari, in the third century. They made profession of abflaining from marriage, and the use of wine, flesh, money, &c.

Gerhard Sagarelli was the founder of the fecond Apostolifect; he obliged his followers to go from place to place as the apostles did, to wander about clothed in white, with long beards, dishevelled hair, and bare heads, accompanied with women, whom they called their spiritual sisters. They likewise renounced all kinds of property and possessions, inveighed against the growing corruption of the church of Rome, predicted its overthrow, and the establishment of a purer church on its ruins. Sagarelli was burnt alive at Parma in the year 1300, and was afterwards succeeded by Dulcinus, who added to the character of an apostle those of a prophet and a general, and carried on a bloody and dreadful war for the space of more than two years against Reynerius, bishop of Vercelli, ; he was at length defeated, and put to death in a barbarous manner in the year 1307. Nevertheless, this feet sublisted in France, Germany, and in other countries, till the beginning of the fifteenth century; when it was totally extirpated under the pontificate of Boniface IX.

The other branch of apollolici was of the twelfth century. These also condemned marriage, preferring celibacy, and calling themselves the chaste brothren and fifters; though each was allowed a spiritual lister, with whom he lived in a domestic relation; and on this account they have been charged with concubinage: they held it unlawful to take an oath; they fet afide the use of baptism; and in many things imitated the Manichees. Bernard wrote against this sect of apo-Rolici.

APOSTOLICUM is a peculiar name given to a kind of fong or hymn, anciently used in churches. The apostolicum is mentioned by Greg. Thaumaturgus as used in his time. Vossius understands it as spoken of the apostles creed: Suicer thinks this impossible, for that this creed was then unknown in the churches of the east.

APOSTROPHE, in rhetoric, a figure by which a person who is either absent or dead is addressed as if he were present and attentive to us. This figure is, in boldness, a degree lower than the address to perfonified objects (See Personification); fince it requires a less effort of imagination to suppose persons present who are dead or absent, than to animate insenfible beings and direct our discourse to them. The poems of Ossian abound with the most beautiful in-stances of this figure. "Weep on the rocks of roaring winds, O Maid of Inistore! Bend thy fair head over the waves, thou fairer than the ghost of the hills when it moves in a fun beam at noon over the filence of Morven! He is fallen! Thy youth is low: pale beneath the fword of Cuchullin!"

APOSTROPHE, in grammar, the contraction of a word by the use of a comma: as call'd for called, the'

APOTACTITÆ, or Apotactici, an ancient sect, who affecting to follow the evangelical counfels of poverty, and the examples of the apostles and primitive Christians, renounced all their effects and possessions. It does not appear that they gave into any errors during their first state; some ecclesiastical writers assure us they had divers holy virgins and martyrs under the perfecution of Dioclesian in the fourth century; but they afterwards fell into the opinions of the Encratitæ, and taught that the renouncing of all riches was not

Apotacli-

Aportichist only a matter of counsel and advice, but of precept mus and necessity. And hence the fixth law in the Theodosian code joins the Apotactitæ with the Eunomians and Arlans.

APOTEICHISMUS, in the ancient military art, a kind of line of circumvallation drawn round a place in order to befiege it. This was also called periteichifmus. The first thing the ancients went about, when they designed to lay close siege to a place, was the apoteichismus; which sometimes consisted of a double wall or rampart, raised of earth; the innermost to prevent sudden sallies from the town, the outermost to keep off foreign enemies from coming to the relief of the besieged. This answered to what are called lines of contravallation and circumvallation among the moderns.

APOTHECARY, one who practifes the art of pharmacy. In London, the apothecaries are one of the city companies. They were incorporated by a charter from King James I. procured at the folicitation of Dr Mayerne and Dr Aitkins; till that time they only made a part of the grocers company; plums, fugar, spice, Venice treacle, mithridate, &c. were fold in the same shop and by the same person. The reason of separating them was, that medicines might be better prepared, and in opposition to divers persons who imposed unwholesome remedies on the people. By an act which was made perpetual in the ninth year of George I. they are exempted from ferving upon juries, or in ward and parish offices. They are obliged to make up their medicines according to the formulas prescribed in the college dispensatory; and are liable to have their shops visited by the censors of the college, who are empowered to destroy such medicines as they think not good.

They have a hall in Black Friars, where there are two fine laboratorics, out of which all the furgeons chefts are fupplied with medicines for the British royal navy.

To his majesty belong two apothecaries: the falary to the first, 320l. to the second, 275l.—To the house-hold belong also two.

The charitable dispensation of medicines by the Chinese is well deserving notice. They have a stone, which is ten cubits high, erected in the public squares of their cities; on this stone are engraved the names of all forts of medicines, with the price of each; and when the poor stand in need of any relief from physic, they go to the treasury, where they receive the price each medicine is rated at.

APOTHECARY, Apothecarius, in writers of the middle age, denotes a shop-keeper or warehouse-keeper.

APOTHECARIUS is also used to denote a store-keeper, or officer appointed to have the direction of a magazine, granary, &c. In which sense apothecarii is sometimes rendered by horearii and rationarii.

APOTHEOŚIS, in antiquity, a heathen ceremony, whereby their emperors and great men were placed among the gods. The word is derived from ano, and the so, God.

After the apotheofis, which they also called deification and consecration, temples, altars, and images were crected to the new deity; facrifices, &c. were offered, and colleges of priests instituted.

It was one of the doctrines of Pythagoras, which he had borrowed from the Chaldees, that virtuous persons after their death were raised into the order of the gods.

And hence the ancients deified all the inventors of Apotheofes things useful to mankind; and those who had done any important service to the commonwealth.—Tibe-Apparatus. rius proposed to the Roman senate the apotheosis of Jesus Christ, as is related by Eusebius, Tertullian, and Chrysostom.

Juvenal rallying the frequent apotheofes, introduces poor Atlas, complaining that he was ready to fink under the burden of so many new gods as were every day added to the heavens. Seneca ridicules the apotheofie of Claudius with admirable humour.

The ceremony, according to Herodian's description, was as follows: After the body of the deceafed had been burnt with the usual folemnities, an image of wax, exactly refembling him, was placed on an ivory couch, where it lay for seven days, attended by the senate and ladies of the highest quality in mourning; and then the young fenators and knights bore the bed of state through the Via Sacra to the old forum, and from thence to the Campus Martius, where it was deposited upon au edifice built in form of a pyramid. The bed being thus placed amidst a quantity of spices and other combuiltibles, and the knights having made a folemn procession round the pile, the new emperor, with a torch in his hand fet fire to it, whilst an eagle, let fly from the top of the building, and mounting in the air with a firebrand, was supposed to convey the soul of the deceased to heaven; and thenceforward he was ranked among the gods.

We often meet with the confectation or apotheofic of emperors represented on medals; where we see the pyramids of several stories, each growing less and less; we see also the eagles slying away with the souls of the deceased emperors. A gem in the museum of Brandenburg represents the apotheosis of Julius Cæsar, mounted upon the celestial globe, and holding an helmin his hand, as if he were now the governor of heaven, as before of the earth. See Deffication.

APOTHERAPIA, (from anotheranes, I cure,) in physic, properly denotes a complete or finished cure.

APOTHERAPIA is also used in the gymnastic art, for the last part of all regular exercise, viz. friction or unction with oil, before as well as after bathing. The design of this was partly to cleanse the skin from any filth or dust it might have contracted during the exercise, and partly to remove weariness.

APOTOME, in geometry, the difference between two incommensurable lines.

APOTOME, in music, the difference between a greater and lesser semi-tone; expressed by the ratio, 128; 125.

APOTROPÆA, (from exergene, I avert,) in the ancient poetry, verfes composed for averting the wrath of incensed deities; and the deities invoked for averting any threatened missortune were called Apotropeans; they were also called Alexicaci, from exele, I drive away, and Averrunci from averrunce, which denotes the same.

APOZEM, in medicine, the fame with decoction. See DECOCTION.

APPARATUS, a term used to denote a complete fet of instruments, or other utensils, belonging to any artist or machine.

APPARATUS is frequently used for the operation of cutting for the stone. For this there are three forts of apparatus, vix. the small, great, and high apparatus. See Surgery.

.Apparatus

APPARATUS is also used as a title of several books composed in form of catalogues, bibliothecas, diction-Apparition aries, &c. for the ease and conveniency of study. The apparatus to Cicero is a kind of concordance, or collection of Ciceronian phrases, &c. The apparatus sacer of Possevin, is a collection of all kinds of ecclesiastical authors printed in 1611, in three volumes.—Glossaries, comments, &c. are also frequently called apparatuses.

APPARENT, in a general fense, something that is visible to the eyes, or obvious to the understanding.

APPARENT, among mathematicians and aftronomers, denotes things as they appear to us, in contradistinction from real or true; thus we fay, the apparent diameter, distance, magnitude, place, figure, &c. of bodies.

APPARENT Heir, in law. No inheritance can vest, nor can any person be the actual complete heir of another, till the ancestor is previously dead. Nemo est hares viventis. Before that time the person who is next in the line of succession is called an heir apparent, or heir prefumptive. Heirs apparent are such, whose right of inheritance is indefeafible, provided they outlive the anceltor; as the eldest son or his issue, who must by the course of the common law be heirs to the father whenever he happens to die. Heirs presumptive are such, who, if the ancestor should die immediately, would in the present circumstances of things be his heirs: but whose right of inheritance may be defeated by the contingency of some nearer heir being born; as a brother, or nephew, whose presumptive succession may be deftroyed by the birth of a child; or daughter, whose present hopes may be hereafter cut off by the birth of a fon. Nay, even if the estate hath descended, by the death of the owner, to fuch brother, or nephew, or daughter, in the former cases, the estate shall be divefted and taken away by the birth of a posthumous child; and, in the latter, it shall also be totally divested by the birth of a posthumous son.

APPARITION, in a general fense, denotes simply the appearance of a thing. In a more limited fense, it is used for a spectre or ghost.—Several instances of apparitions occur in the Bible; that of Samuel, raised by the witch of Endor, has occasioned great disputes. We find great controversies among authors, in relation to the reality, the existence or non-existence, the possibility or impossibility, of apparitions. The Chaldeans, the fews, and other nations, have been the steady asfertors of the belief of apparitions. The denial of fpirits and apparitions is by some made one of the marks of infidelity, if not of atheilm. Many of the apparitions we are told of in writers, are doubtless mere delutions of the fenfe; many others are fictitious, contrived merely to amuse, or answer some purpose. Apparitions, it is certain, are machines that on occasion have been of good fervice both to generals, to ministers

of state, to priests, and others.

Partial darkness, or obscurity, are the most powerful means by which the fight is deceived: night is therefore the proper season for apparitions. Indeed the state of the mind, at that time, prepares it for the admission of these delusions of the imagination. The fear and caution which must be observed in the night; the opportunity it affords for ambufcades and affaffinations; depriving us of fociety, and cutting off many pleasing trains of ideas, which objects in the light never fail to introduce, are all circumitances of terror: and perhaps,

on the whole, fo much of our happiness depends upon Apparition our fenses, that the deprivation of any one may be attended with proportionable horror and uneafinefs. The notions entertained by the ancients respecting the soul, may receive fome illustration from these principles. In dark or twilight, the imagination frequently transforms an inanimate body into a human figure; on approaching, the fame appearance is not to be found: hence they fometimes fancied they saw their ancestors; but not finding the reality, diffinguished these illusions by the name of shades.

Many of these fabulous narrations might originate from dreams. There are times of flumber when we are not sensible of being asleep. On this principle, Hobbes has ingeniously accounted for the spectre which is said to have appeared to Brutus. "We read," fays he, " of M. Brutus, that at Philippi, the night before he gave battle to Augustus Cæsar, he saw a fearful apparition, which is commonly related by historians as a vision; but, confidering the circumstances, one may cafily judge it to have been but a short dream. For fitting in his tent, penfive, and troubled with the horror of his rash act, it was not hard for him, slumbering in the cold, to dream of that which most affrighted him; which fear, as by degrees it made him wake, fo it must needs make the apparition by degrees to vanish: and having no affurance that he slept, he could have no cause to think it a dream, or any thing but a vision."—The well known story told by Clarendon, of the apparition of the duke of Buckingham's father, will admit of a fimilar folution. There was no man in the kingdom fo much the subject of conversation as the Duke; and from the corruptness of his character, he was very likely to fall a facrifice to the enthufiasm of the times. Sir George Villiers is faid to have appeared to the man at midnight: therefore there is the greatest probability that the man was asseep; and the dream affrighting him, made a strong impression, and was likely to be repeated.

APPARITOR, among the Romans, a general term to comprehend all attendants of judges and magistrates appointed to receive and execute their orders. Apparitor, in England, is a messenger that serves the process of a spiritual court, or a beadle in an university who carries the mace.

APAUMEE, in heraldry, denotes one hand extended, with the full palm appearing, and the thumb

and fingers at full length.

APPEAL, in law, the removal of a cause from an inferior to a superior court or judge, when a person thinks himself aggrieved by the sentence of the inferior judge. Appeals lie from all the ordinary courts of juftice to the House of Lords. In ecclesiastical cases, if an appeal is brought before a bishop, it may be removed to the archbishop; if before an archdeacon, to the court of arches, and thence to the archbishop; and from the archbishop's court to the king in chancery.

APPEAL, in common law, denotes an accufation by a private fubject against another for some heinous crime; demanding punishment on account of the particular injury fuffered, rather than for the offence against the public.

This private process, for the punishment of public crimes, had probably its original in those times, when a private pecuniary fatisfaction, called a weregild, was

constantly

Appeal conflantly paid to the party injured, or his relations, to explate enormous offences. This was a custom derived to the English, in common with other northern nations, from their ancestors the ancient Germans; among whom according to Tacitus, luitur bemicidium certo armentorum ar pecorum numero; recipitque fatisfactionem universa dome. In the same manner, by the Irish Brehon law, in case of murder, the brehon or judge was used to compound between the murderer and the friends of the deceased who prosecuted him, by causing the malefactor to give unto them, or to the child or wife of him that was flain, a recompense which they called an eriach. And thus we find in the Anglo-Saxon laws (particularly those of King Athelstan) the several weregilds for homicide established in progressive order, from the death of the ceorl or peafant, up to that of the king himfelf. And in the laws of Henry I. we have an account of what other offences were redeemable by weregild, and what were not fo. As, therefore, during the continuance of this custom, a process was certainly given for recovering the weregild by the party to whom it was due; it feems that, when thefe offences by degrees grew no longer redeemable, the private process was still continued, in order to ensure the insliction of punishment upon the offender, though the party injured was allowed no pecuniary compensation for the offence.

But though appeals were thus, in the nature of profecutions for fome atrocious injury, committed more immediately against an individual, yet it also was anciently permitted, that any fubject might appeal another subject of high treason, either in the courts of common law, or in parliament, or (for treasons committed beyond the seas) in the court of the high constable and marshal. The cognizance of appeals in the latter still continues in force; and fo late as 1631, there was a trial by battle awarded in the court of chivalry, on fuch an appeal of treason: but that in the first was virtually abolished by the statutes 5 Edw. III. c. 9. and 2 Edw. III. c. 24. and in the fecond expressly by thatute 1 Hen. IV. c. 14. So that the only appeals now in force for things done within the realm, are appeals of felony and mayhem.

An appeal of felony may be brought for crimes committed either against the parties themselves or their relations. The crimes against the parties themselves are larceny, rape, and arfon. And for these, as well as for mayhem, the persons robbed, ravished, maimed, or whose houses are burnt, may institute this private proceis. The only crime against one's relation, for which an appeal can be brought, is that of killing him, by either murder or manslaughter. But this cannot be brought by every relation; but only by the wife for the death of her husband, or by the heir male for the death of his ancestor; which heirship was also confined by an ordinance of Henry I. to the four nearest degrees of blood. It is given to the wife on account of the loss of her husband; therefore, if she marries again, before or pending her appeal, it is loft and gone; or, if the marries after judgment, the shall not demand execution. The heir, as was faid, must also be heir male, and fuch a one as was the next heir by the course of the common law at the time of the killing of the ancestor. But this rule has three exceptions: 1. If the person killed leaves an innocent wife, the only, and not the heir, shall have the appeal. 2. If there be no wife, and

the heir be accused of the murder, the person, who Appeal. next to him would have been heir male, shall bring the appeal. 3. If the wife kills her husband, the heir may appeal her of the death. And, by the statute of Gloucefter, 6 Edw. I. c. q. all appeals of death must be sued within a year and a day after the completion of the felony by the death of the party: which feems to be only declaratory of the old common law; for in the Gothic constitutions we find the same " prescriptio annalis, que currit adversus actorem, si de homicida ei non constat intra annum a cede facta, nec quenquam interea arguat et accufet."

These appeals may be brought previous to any indictment; and, if the appellee be acquitted thereon, he cannot be afterwards indicted for the same offence. In like manner as by the old Gothic conftitution, if any offender gained a verdict in his favour, when profecuted by the party injured, he was also understood to be acquitted of any crown profecution for the same offence: but, on the contrary, is he made his peace with the king, still he might be prosecuted at the suit of the party. And so, in England, if a man be acquitted on an indicament of murder, or found guilty, and pardoned by the king, still he ought not (in strictness) to go at large, but be imprisoned or let to bail till the year and day be past, by virtue of the statute 3 Hen. VIII. c. 1. in order to be forthcoming to answer any appeal for the same felony, not having as yet been punished for it: though, if he hath been found guilty of manslaughter on an indictment, and hath had the benefit of clergy, and fuffered the judgment of the law, he cannot afterwards be appealed; for it is a maxim in law, "that nemo bis punitur pro codem delicio." Before this flatute was made it was not usual to indict a man for homicide within the time limited for appeals; which produced very great inconvenience.

If the appellee be acquitted, the appellor (by virtue of the statute of Westm. 2. 13 Edw. I. c. 12.) shall suffer one year's imprisonment, and pay a fine to the king, belides reflitution of damages to the party for the imprisonment and infany which he has fultained: and, if the appellor be incapable to make restitution, his abettors shall do it for him, and also be liable to imprisonment. This provision, as was foreseen by the author of Fleta, proved a great discouragement to appeals; fo that thenceforward they ceafed to be in common use.

If the appellee be found guilty, he shall suffer the same judgment, as if he had been convicted by indictment : but with this remarkable difference, that on an indictment, which is at the fuit of the king, the king may pardon and remit the execution; on an appeal, which is at the fuit of a private subject, to make an atoncment for the private wrong, the king can no more pardon it, that he can remit the damages recovered on an action of battery. In like manner as, while the weregild continued to be paid as a fine for homicide, it could not be remitted by the king's authority. And the ancient usage was, so late as Henry IV's time, that all the relations of the flain should drag the appellee to the place of execution: a cuftom, founded upon that favage spirit of family refentment which prevailed univerfally through Europe after the irruption of the northern nations, and is peculiarly attended to in their feveral codes of law; and which prevails even now among

Appetite.

rance Appella-

tion.

136 Appears the wild and untutored inhabitants of America: as if the finger of nature had pointed it out to mankind, in their rude and uncultivated state. However, the punishment of the offender may be remitted and discharged by the concurrence of all parties interested; and as the king by his pardon may frustrate an indictment, so the appellant by his release may discharge an appeal: " nam quilibet potest renunciare juri pro se introducto."

> APPEARANCE, in a general fense, the exterior furface of a thing, or that which immediately strikes

the fenfes.

APPEARANCE, in law, fignifies a defendant's filing a common or special bail, on any process issued out of a court of judicature.

APPELLANT, in a general fense, one who pa--peals. See APPEAL.

APPELLANTS, in church history, an appellation given to fuch of the catholic clergy as appeal from the constitution unigenitus to a general council.

APPELLATION, the name by which any thing is known or diffinguished when spoken of. See NAME.

Nothing can be more foreign to the original meaning of many words and proper names, than their prefent appellations, frequently owing to the history of those things being forgotten, or an ignorance of the language in which they were expressed. Who, for example, when the crier of a court bawls out, "O yes, O yes," would dream that it was a proclamation commanding the talkers to become hearers, being the French word Oyez, "liften," retained in our courts ever fince the law pleadings were held in French? Or would any person suppose that the headland on the French coast, near Calais, called by our feamen Blackness, could be fo titled from its French name of Blanc Nez, or, the White, Headland.

King Henry the Eight having taken the town of Boulogne in France, the gates of which he brought to Hardes in Kent, where they are still remaining, the flatterers of that reign highly magnified this action, which, Porto Bello like, became a popular subject for figns; and the port or harbour of Boulogne, called Boulogne Mouth, was accordingly let up at a noted inn in Holburn; the name of the inn long outliving the fign and fame of the conquest, an ignorant painter employed by a no less ignorant landlord, to paint a new one, represented it by a bull and a large gaping human mouth (answering to the vulgar pronunciation of Bull and Mouth). The same piece of history gave being to the bull and gate, originally meant for Boulogne gate, and represented by an embattled gate or entrance

into a fortified town. The barber's pole has been the subject of many conjectures; some conceiving it to have originated from the word poll, or head, with several other conceits as far-fetched and as unmeaning: but the true intention of that party coloured staff was to show that the mafter of the shop practifed surgery, and could breathe a vein as well as mow a beard; fuch a staff being to this day by every village practitioner, put into the hand of a patient undergoing the operation of phlebotomy. The white band which encompasses the staff, was meant to represent the fillet, thus elegantly twined about it.

Nor were the Chequers (at this time a common fign of a public house) less expressive, being the representation of a kind of draught board called tables, and

showed that there that game might be played. From Appellatheir colour which was red, and the fimilarity to a lattice. it was corruptly called the red lettuce, which word is frequently used by ancient writers to fignify an alchouse.

The Spectator has explained the fign of the lell favage inn plausibly enough, in supposing it to have been originally the figure of a beautiful female found in the woods, called in French la belle fauvage. But another reason has since been assigned for that appellation, namely, that the inn was once the property of Lady Arabella Savage, and familiarly called Bell Savage's inn, probably represented, as at present, by a bell and a savage or wild man, which was a rebus for her name; rebusses being much in fashion in the 16th century, of which the bolt and tun is an instance.

The three blue balls prefixed to the doors and windows of pawnbrokers shops, by the vulgar humorously enough faid to indicate that it is two to one that the things pledged are never redeemed, was in reality the arms of a fet of merchants from Lombardy, who were the first that publicly lent money on pledges. They dwelt together in a street, from them named Lombard Street in London, and also gave their name to another at Paris. The appellation of Lombard was formerly all over Europe confidered as synonymous to that of ulurer.

At the institution of yeomen of the guards, they used to wait at table on all great solemnities, and were ranged near the buffets; this procured them the name of bufficiers, not very unlike in found to the jocular appellation of beaf enters, now given them; though probably it was rather the voluntary milnomer of fome wicked wit, than an accidental corruption arifing from ignorance of the French language,

The opprobrious title of bum bayliffe, fo constantly bestowed on the sheriss's officers, is, according to Judge Blackstone, only the corruption of bound bayliffe, every sheriff's officer being obliged to enter into bonds and to give fecurity for his good behavior, previous to his

appointment.

A cordwainer feems to have no relation to the occupation it is meant to express, which is that of a shoemaker. But cordonier, originally spelt cordaunier, is the French word for that trade; the best leather used for shoes coming originally from Cordova in Spain. Spanish-leather shoes were once famous in England.

APPELLATIVE NAMES, in grammar, in contradistinction to proper names, are such as stand for univerfal ideas, or a whole rank of beings, whether general or special. Thus fish, bird, man, city, river, are common or appellative names; and so are trout, cel, lobster; for they all agree to many individuals, and fome to many species. See NAME.

APPELLEE, among lawyers, the person against whom an appeal is brought. See APPEAL.

APPENDIX, in literature, a treatife or supplement added at the end of a work, to render it more complete.

APPERCEPTION or Adpenception, a term used by Leibnitz and his followers for consciousness.

APPETITE, in a general sense, the desire of enjoying some object, supposed to be conducive to our happiness. When this inclination is guided by reason, and proportioned to the intrinsic value of the object, it is called rational appetite; as, on the other hand, it is denominated

Appetite denominated feafitive appetite, when we have only a blind propenlity to a thing, without determinate ideas Applaufe of the good qualities for which we defire it.

Appetites are passions directed to general objects, in contradillinction to passions directed to particular objects, which retain their proper name. Thus we say, an appetite for fame, for glory, for conquest, for riches; but we say the passion of love, of gratitude, of envy, &c. Appetite may be also distinguished from passion, fince the latter has no existence till a proper object be presented; whereas the former exists first, and then is directed to an object.

APPETITE, in medicine, a certain painful or uneafy fensation, always accompanied with a desire to cat or drink.—An excessive appetite is called by physicians bulimy or fames canina; a defect or loss of it, anorexy; and that after things improper for food, pica.

APPIA via, a way reaching from Rome through Capua to Brundusium, between 330 and 350 miles long. Appius Claudius, surnamed Cacus, in the year of the city 441, carried it from the Porta Capena to Capua (Livy, Frontinus). It was afterwards carried on to Brundusium; but by whom, or when, is uncertain. It was laid with very hard flone, brought from a great distance, large and squared (Diodorus); and it was so wide, that several waggons could go abreaft. Statius calls it the queen of roads. Its course is described by Horace, Strabo, and Antonine.

APPIAN, an eminent writer of the Roman history in Greek, under the reign of Trajan and Hadrian. He was of a good family in Alexandria in Egypt; whence he went to Rome, and there distinguished himself so well as an advocate, that he was chosen one of the procurators of the empire, and the government of a province was committed to him. He did not complete the Roman history in a continued series; but wrote distinct histories of all nations that had been conquered by the Romans, in which he placed every thing relating to those nations in the proper order of time. His style is plain and simple: in the opinion of Phocius, he has shown the greatest knowledge of military affairs, and the happiest talent at describing them, of any of the historians; for while we read him, we in a manner see the battles which he describes. Of all this voluminous work there remains only what treats of the Punic, Syrian, Parthian, Mithridatic, and Spanish wars, with those against Hannibal, the civil wars, and the wars in Illyricum, and some fragments of the Celtic or Gallic wars.

APPIUS CLAUDIUS, a Sabine by birth, one of the principal inhabitants of Regillum: His shining merit having drawn the envy of his fellow citizens upon him, he retired to Rome with all his family. Appius was admitted into the fenate, and was made conful, with Publius Servilius Priscus, in 258 from the building of Rome: but he was hated by the plebeians, being an austere opposer of their clamours and seditions. Claudian family continued long one of the most illustrious of the patrician families in Rome; and several in fuccession of the name of Appius supported the same stern character that distinguished their first founder.

APPLAUSE, an approbation of fomething, fignified by clapping the hands, still practifed in theatres. -Applause, in antiquity, differed from ACCLAMATION, as the latter was articulate and performed with the voice, the former with the hands. Among the Ro-Vol. II. Part I.

mans, applause was an artificial musical kind of noise, made by the audience or spectators to express their fatisfaction. There were three species of applause, de-Appointee nominated from the different noises made in them, viz, Bombus, Imbrices, and Teste; the first a confused din, made either by the hands or the mouth; the fecond and third, by beating on a fort of founding veffels placed in the theatres for this purpose. Persons were instructed to give applause with skill; and there were even masters who professed to teach the art. The proficients in this way let themselves out for hire to the vain glorious among the poets, actors, &c. and were properly disposed to support a loud applause. These they called Laudicani, and Esponans. At the end of the play, a loud peal of applause was expected, and even asked of the audionce, either by the chorus or the person who spoke last. The formula was. Spelletores plaudite, or Valete et plaudite. The plaufores, or applauders, were divided into chori, and disposed in theatres opposite to each other, like the choristers in cathedrals, fo that there was a kind of concert of applauses.

APPLE, the fruit of the pyrus malus. See Pyrus. APPLE of the eye, a name not unfrequently given to the pupil. See Anatomy.

APPLES of Love. See Lycopersicon.

Mad APPLES. See MELONGENA.

APPLEBY, the county town of Westmorland, where the affizes are held, is feated on the banks of the river Eden, which almost furrounds it. It was formerly a very confiderable town, and had great privileges; but it is long ago gone to decay, and now only confilts of mean houses in one broad fireet, which runs with an easy ascent from north to south; at the head of which is the castle, almost entirely surrounded by the river. It has two churches; a town hall, in which the affizes are held; a county jail; and an hospital for a governess and twelve widows, founded in 1651 by a daughter of Lord Clifford. It is governed by a mayor, twelve aldermen, a common council, and two ferjeants at mace, &c. Here is faid to be the best corn market in these northern parts. It sends two members to parliament. W. Long. 3. 52. N. Lat. 54. 30.

APPLICATION, in a general sense, is the laying two things together, in order to discover their agreement or disagreement.

Application, in geometry, is used either for division, for applying one quantity to another, whose areas, but not figure, shall be the same; or, for transferring a given line into a circle, or other figure, fo that its ends shall be in the perimeter of the figure.

APPLICATION, in theology, is particularly used, by fome divines, for the act whereby our Saviour transfers, or makes over to us, what he had earned or purchased by his holy life and death. Accordingly it is by this application of the merits of Christ that we are to be justified and entitled to grace and glory. The sacraments are the ordinary means or instruments whereby this application is effected.

APPOGIATURA, in music, a small note inserted by the practical musician, between two others, at some

distance.

APPOINTEE, a foot foldier in the French army, &c. who for his long fervice and bravery receives pay above private sentinels. These have been suppressed in France. Appointed France, except in the regiment of French guards, where forty appointees are still retained to each com-Apprenpany of 150 men.

Till the year 1670, they had also captains and lieutenants under the appellation of appointees, who, without residing in the regiment, received their pay.

APPOINTEE, in heraldry, the same as aguifee: Thus we fay, a cross appointée, to fignify that with two angles at the end cut off, so as to terminate in points.

APPOINTMENT, in a general sense, the same as Assignation.

APPOINTMENT, in a particular lense, denotes a pension or falary given by great lords and princes to perfons of worth and parts, in order to retain them in their fervice. The term is chiefly used among the French. The king of France gives large appointments to several of the officers in his service. Appointments differ from wages, in that the latter are fixed and ordinary, being paid by the ordinary treasurers; whereas appointments are annual gratifications granted by brevet for a time uncertain, and are paid out of the privy purse.

APPOSER fignifies an examiner. In the court of exchequer, there is an officer called the foreign appofer. In the office of confirmation, in the first liturgy of Edward VI. the rubric directs the bishop, or such as he shall appoint, to appose a child; and a bishop's examining chaplain was anciently called his pofer.

APPOSITION, in grammar, the placing two or more substantives together, in the same case, without any copulative conjunction between them; as, Ardebat Alexim, delicias domini.

APPRAISER (from ad, "to," and pretium, "value"), one who rates or lets a value upon goods, &c. He must be a skilful and honest person. It is not a business of itself, but is practifed by brokers of householdfurniture; to which let of men the word is chiefly applied: Yet upholsterers and other brokers are employed, or even any person or persons who are supposed to be skilled in the commodities to be appraised or valued. They are employed in cases of death, executions brought in upon goods, or of stock to be turned over from one person to another, or divided between copartners; and are called fworn appraisers, from their taking an oath to do justice between party and party. They fometimes appraise on behalf of both sides, each party agreeing to have the same appraiser or appraisers; sometimes in opposition, each party choosing one or more of a fide; and fometimes by commission or deputation of trustees, masters in chancery, &c.

APPRAISING, the act of rating, valuing, or fetting a price on goods, by a person who is a competent judge, and is authorized thereto. See APPRAISER.

APPREHENSION, in logic, denotes the fimple attention of the mind to an object presented either to our sense or our imagination, without passing a judgement or making any inference.

Apprehension, is likewised used to express an inadequate and imperfect idea; and thus it is applied to our knowledge of God in contradiffinction to compre-

Apprehension, in law, signifies the seizing a criminal, in order to bring him to justice.

APPRENTICE, (from apprendre, "to learn,") one who is bound by covenant to serve a tradesman or artificer a certain time, upon condition of the mafter's Appreninstructing him in his art or mystery.

Apprentices may likewise be bound to husbandmen, or even to gentlemen; and they, as well as tradefmen, in England, are compellable to take the children of the poor, whom the overfeers, with the confent of two justices, may bind till the age of twenty-four years. Apprentices may be discharged on reasonable cause; but if any, whose premium has been less than ten pounds run away from their masters, they are compellable to serve out the time of absence, or give satisfaction for it, at any period within seven years after expiration of the original contract. Apprentices gain a fettlement in that parish where they last served forty days; and by the 5th of Elizabeth, c. 4. they have an exclusive right to exercise the trade in which they have been instructed, in any part of England. However, the refolutions of the courts have in general rather confined than extended the restriction of this statute. See Blackstone's Com. Vol. I. p. 426, &c.

In France, the fons of tradefmen, living in their father's house till seventeen years of age, are reputed to have ferved an apprenticeship. In that country, the times of serving are different in the different professions, from three years to eight. After ferving out an apprenticeship, the person becomes what they call an a/pirant, or candidate for mastership, and is to be examined by proper officers as to his skill and proficiency, and also to exhibit a chef d'auvre or masterpiece in the art he has been bred to, before he be fuffered to fet up to practife for himself. And the custom of France in regard to apprentices, is not unworthy the imitation of other nations.

Anciently, benchers in the inns of court were called apprentices of the Law, in Latin apprenticii juris nobiliores; as appears by Mr Selden's note on Fortefcue: and so the learned Plowden styles himself. Henry Finch, in his Nomotechnia, writes himself, apprentice de ley : Sir Edward Coke in his Infl. fays, Apprenticii legis, in pleading, are called bomines confiliurii et in lege periti; and in another place, apprentices and other counfellors of law.

Apprentices indentures and articles of clerkship, pay of duty fix shillings. Parish indentures are excepted, and pay fixpence only, by 5 W. III. c. 21. For fees given with apprentices, clerks, or fervants, bound or articled by indentures, from 11. to 501. matters pay for every pound fixpence; and for fees above 50l. one shilling in the pound. 8 Ann. c. q.

APPRENTICESHIP, the fervitude of an apprentice, or the duration of his indenture.

Seven years feem anciently to have been, all over Europe, the usual term established for the duration of apprenticeships in the greater part of incorporated trades. All fuch incorporations were anciently called universities; which, indeed, is the proper Latin name for any incorporation whatever. The univerfity of fmiths, the university of taylors, &c. are expressions which we commonly meet with in the old charters of ancient towns. When those particular incorporations which are now peculiarly called universities were first established, the term of years which it was necessary to fludy, in order to obtain the degree of master of arts, appears evidently to have been copied from the term of apprenticeship in common trades, of which the incor-

porations

Appren- porations was much more ancient. As to have wrought seven years under a master properly qualified was necessary in order to entitle any person to become a malter, and to have himfelf apprentices in a common trade; so to have studied seven years under a master properly qualified was necessary to entitle him to become a master, teacher or doctor (words anciently fynonymous), in the liberal arts, and to have scholars or apprentices (words likewife originally fynonymous) to fludy under him.

> By the 5th of Elizabeth, commonly called the flatute of apprenticeship, it was enacted, that no person should for the future exercise any trade, craft, or mythery at that time exercised in England, unless he had previously served to it an apprenticeship of seven years at least; and what before had been the bye-law of many particular corporations, became in England the general and public law of all trades carried on in market towns. For though the words of the flatute are very general, and feem plainly to include the whole kingdom, by interpretation its operation has been limited to market towns; it having been held, that in country villages a person may exercise several different trades, though he has not ferved a feven years apprenticeship to each, they being necessary for the convemency of the inhabitants, and the number of people frequently not being sufficient to supply each with a particular fet of hands,

> By a strict interpretation of the words, too, the operation of this statute has been limited to those trades which were established in England before the 5th of Elizabeth, and has never been extended to fuch as have been introduced fince that time. This limitation has given occasion to feveral diffinctions which, confidered as rules of police, appear as foolish as can well be imagined. It has been adjudged, for example, that a coachmaker can neither himself make, nor employ journeymen to make, his coach wheels, but must buy them of a malter wheelwright, this latter trade having been exercifed in England before the 5th of Elizabeth. But a wheelwright, though he has never ferved an apprenticethip to a coachmaker, may either himfelf make, or employ a journeyman to make coaches; the trade of a coachmaker not being within the flatute, because not exercised in England at the time when it was made. The manufacturers of Manchetter, Birmingham, and Wolverhampton, are many of them upon this account not within the statute; not having been exercifed in England before the 5th of Elizabeth.

> In France the duration of apprenticeships is different in different towns and in different trades. In Paris, five years is the term required in a great number; but before any person can be qualified to exercise the trade as a mafter, he must in many of them, serve five years more as a journeyman. During this latter term he is called the companion of his matter, and the term itself is called his companion bip.

> In Scotland there is no general law which regulates univerfally the duration of apprenticeships. The term is different in different corporations. Where it is long, a part of it may generally be redeemed by paying a small fine. In most towns, too, a very small fine is fufficient to purchase the freedom of any corporation. The weavers of linen and hempen cloth, the principal manufactures of the country, as well as all other arti

ficers subservient to them, wheelmakers, reelmakers, Appren-&c. may exercise their trades in any town corporate ticeship, without paying any fine. In all towns corporate, all Appriling. persons are free to sell butcher's meat upon any lawful day of the week. Three years is in Scotland a common term of apprenticeship, even in some very nice trades: and in general there is no country in Europe in which corporation laws are so little oppressive.

Apprenticeships were altogether unknown to the ancients. The reciprocal duties of master and apprentice make a confiderable article in every modern code. The Roman law is perfectly filent with regard to them. There is no Greek or Latin word which expresses the idea we now annex to the word apprentice; a fervant bound to work at a particular trade for the benefit of a master during a term of years, upon condition that the master shall teach him that trade.

Long apprenticeships Dr Smith considers as alto-Wealth of gether unnecessary. The arts, which are much super-National rior to common trades, fuch as those of making clocks Vol. I. P. and watches, contain no fuch mystery as to require a 190. long course of instruction. The first invention of such beautiful machines, indeed, and even that of fome of the instruments employed in making them, must, no doubt, have been the work of deep thought and long time, and may justly be considered as among the happiell efforts of human ingenuity: but when both have been fairly invented and are well understood; to explain to any young man, in the completest manner, how to apply the inflruments, and how to conftruct the machines, cannot well require more than the leffons of a few weeks; perhaps those of a few days might be sufficient. In the common mechanic trades, those of a few days might certainly be fufficient. The dexterity of hand, indeed, even in common trades, cannot be acquired without much practice and experience. But a young man would practife with much more diligence and attention, if from the beginning he wrought as a journeyman, being paid in proportion to the little work which he could execute, and paying in his turn for the materials which he might fometimes spoil through awkwardness and inexpertence. His education in this way generally would be more effectual, and always lefs tedious and expentive. The mafter, indeed, would be a lofer; he would lofe all the wages of the apprentice, which he now faves, for feven years together. In the end perhaps, the apprentice himself would be a loser. In a trade fo eatily learnt he would have more competitors; and his wages, when he came to be a complete workman, would be much lefs than at prefent. The fame increase of competition would reduce the profits of the mafters as well as the wages of the workmen. The trades, the crafts, the mysteries, would all be losers: but the public would be a gainer: the work of all artificers coming in this way much cheaper to market.

APPRISING, in Scots law, the name of that action by which a creditor formerly carried off the effate of his debtor for payment. It is now abolified, and adjudications are appointed in place of it .- Adjudications, charter, relignation, clare conflat, cognition of heirs, heritable right, confirmation, novodamus, principal and original inflrument of furrender, retour, feifin, and fervice in Scotland, pay by different acts 48. 9d. duty.

APPROACH,

Approach API
fenfe, t
Appropria- things.

APPROACH, or APPROACHING in a general fense, the acceding or coming together of two or more things.

APPROACHES, in fortification, the works thrown up by the befiegers, in order to get nearer a fortress, with-

out being exposed to the enemy's cannon.

APPROACHING, in fowling, a term used to express such devices as are contrived for the getting within shot of shy birds. It is principally used in marshy low places. The best method of approaching is by means of three hoops tied together at proper distances according to the height of the man that is to use it, and having boughs of trees tied all round it, with cords to hang it over his shoulders; a man getting into this, conceals himself, and approaches by degrees towards has game in the form of a moving bush. Geese, ducks, and teal, quit the waters in the evening, and pass the night in the fields; but at the approach of morning they return to the water again, and even when on the water they will retire to great distances, on the approach even of a horse or cow, so that the business of the stalking horse is of little use; but this device of approaching by the moving bush succeeds tolerably well with them.

Approaching in gardening, the innoculating or ingrafting the sprig of one tree into another, without

cutting it off the parent tree.

APPROBATION, a state or disposition of the mind, wherein we put a value upon, or become pleafed with, some person or thing. Moralists are divided on the principle of approbation or the motive which determines us to approve and disapprove. The Epicureans will have it to be only felf-interest: according to them, that which determines any agent to approve his own action, is its apparent tendency to his private happiness; and even the approbation of another's action flows from no other caule but an opinion of its tendency to the happiness of the approver, either immediately or remotely. Others refolve approbation into a moral fense, or a principle of benevolence by which we are determined to approve every kind affection either in ourselves or others, and all publicly useful actions, which we imagine to flow from fuch affection, without any view therein to our own private happiness.

Approbation, is more particularly used, in speaking of recommendations of books, given by persons qualisted or authorized to judge of them. Those appointed to grant licenses and imprimaturs, frequently express their approbation of books. Books were formerly subjected to a licenser in England, (see 13th Car. II. c. 33.), which act is long since expired; and being incompatible with the noble principles of the Revolution, has never since been, and it is hoped never will

be, revived.

APPROPRIATION, in the canon law, a fevering of a benefice ecclefiastical to the proper and perpetual use of some religious house. See the article

PARSON

The crivance of appropriations feems to have fprung in the policy of the monatic orders, who have in the policy of the monatic orders, who have in the been deficient in fubtle inventions for the increase which own power and emoluments. At the first establishment of parochial clergy, the tithes of the parish were distributed in a fourfold division; one for the bishop, another for main-

taining the fabric of the church, a third for the Appropriate poor, and the fourth to provide for the incumbent. When the fees of the bishops became otherwise amply endowed, they were prohibited from demanding their usual share of these tithes, and the division was into three parts only. And hence it was inferred by the monasteries, that a small part was sufficient for the officiating priest; and that the remainder might well. be applied to the use of their own fraternities (the endowment of which was construed to be a work of the most exalted piety), subject to the burden of repairing the church and providing for its constant supply. And therefore they begged and bought, for masses and obits, and fometimes even for money, all the advowfons within their reach, and then appropriated the benefices to the use of their own corporation. But, in order to complete such appropriation effectually, the king's license, and consent of the bishop, must first be obtained; because both the king and the bishop may some time or other have an interest, by lapse, in the prefentation to the benefice; which can never happen if it be appropriated to the use of a corporation, which never dies: and also because the law reposes a confidence in them, that they will not confent to any thing that shall be to the prejudice of the church. The confent of the patron also is necessarily implied, because the appropriation can be originally made to none but to fuch spiritual corporation as is also the patron of the church; the whole being indeed nothing elfe but an allowance for the patrons to retain the tithes and glebe in their own hands, without prefenting any clerk, they themselves undertaking to provide for the service of the church. When the appropriation it thus made, the appropriators and their fucceffors are perpetual parsons of the church; and must sue and be fued, in all matters concerning the rights of the church, by the name of parsous.

This appropriation may be severed, and the church become disappropriate, two ways; as, first, If the patron or appropriator presents a clerk, who is instituted and inducted to the parsonage; for the incumbent so instituted and inducted is to all intents and purposes complete parson; and the appropriation being once severed, can never be reunited again, unless by a repetition of the same solemnities. And, when the clerk so presented is distinct from the vicar, the rectory thus vested in him becomes what is called a fine-cure; because he hath no cure of souls, having a vicar under him to whom that cure is committed. Also, if the corporation which has the appropriation is dissolved, the parsonage becomes disappropriate at common law; because the perpetuity of person is gone, which is ne-

cessary to support the appropriation.

In this manner, and subject to these conditions, may appropriations be made at this day: and thus were most, if not all of the appropriations at present existing originally made; being annexed to bishopricks, prebends, religious houses, nay, even to numeries, and certain military orders, all of which were spiritual corporations. At the dissolution of monasteries, by statutes 27 Hen. VIII. c. 28. and 31 Hen. VIII. c. 13. the appropriations of several parsonages, which belonged to those respective religious houses (amounting to more than one third of all the parishes in England), would have been by the rules of the common law disappro-

priated;

THE PARTY OF THE PROPERTY OF THE PARTY OF TH

APPROVER, in law, one who, confessing felony in himself, appealeth or impeacheth another or more of his accomplices. He is so called from the French approuver, comprobare, because he must prove what he hath alleged in his appeal. This proof was anciently either by battle, or by the country, at the choice of the appellee: and the form of this accusation may be

found in Crompt. Just. 250.

Approvers of the king, are those who have the letting of the king's demesnes in small manors, &c. In the statute of the 1st of Ed. III. c. 8. sheriffs are called

the king's approvers.

It being in the discretion of the court to suffer one to be an approver, this method of late hath seldens been practised. But we have in cases of burglary and robbery on the highway, what seems to amount to the same by statute; it being ordained, that where persons charged with such crimes out of prison, discover two others concerned in the crime, they shall have a pardon, &c. Stat. 5th Anne, c. 31.

APPROVER is particularly used in ancient law writers, for a bailiff or land steward, appointed to have the care of a manor, franchise, or the like, and improve and make the most of it for the benefit of his master. In this sense, the word is also written appraire.

APPROXIMATION, in arithmetic and algebra, the coming nearer and nearer to a root, or other quantity fought, without expecting to be ever able to find it as all r

APPUI, in the manege, (q. d. reft or stay upon the hand), is the reciprocal effort between the horse's mouth and the bridle hand, or the sense of the action of the bridle on the hand of the horseman.

A just appui of the hand, is the nice bearing up or stay of the bridle, so that the horse, being awed by the sentibility and tenderness of his mouth, dares not rest too much upon the bitmouth, nor check or beat upon the hand to withstand it. A horse is said to have no appui, when he is too apprehensive of the hand, and cannot bear the bit. He is said to have too much appui, when he rests or throws himself too much upon the bit. Horses designed for the army ought to have a full appui upon the hand. To give a horse a good appui, he should be galloped, and put often back.

APPULSE, in altronomy, the approach of any planet to a conjunction with the sun, or a star. It is a step towards a transit, occultation, conjunction, eclipse, &c. Mr Flamsted, M. de la Hire, and others, have given observations of the moon's appulses to the Pleiades. Phil. Trans. N° 76. p. 361. M. Acad. Science, an.

1708.

APRICOT, in botany. See PRUNUS. APRIES, fon of Pfammis, king of Egypt; the He ruined Sidon, and some say he put Jeremiah to death. He thought neither God nor man could dethrone him; which yet was easily done by Amasis, and he himself was strangled by the Egyptians.

APRIL, the sourth month of the year, according to the common computation; but the second, accord-

same with Pharaoh Hophrah in Jeremiah and Ezekiel.

APRIL, the fourth month of the year, according to the common computation; but the second, according to that of the astronomers. It contains 30 days.—The word is derived from aprilis, of aperio, "I open;" because the earth, in this month, begins to open her bosom for the production of vegetables. In this month the sun travels through the sign Taurus.

A PRIORI, a kind of demonstration. See Dr.

MONSTRATION.

APRON, in naval architecture, is a piece of curved timber fixed behind the lower part of the stern, immediately above the foremost end of the keel.

Arron is also a name given to a platform or flooring of plank, raised at the entrance of a dock, against

which the dock gates are shut.

Araon, in gunnery, a piece of lead which caps or covers the vent or touch hole of a great gun.

APSIS or ABBIS, fignifies the bowed or archedroof of a house, room, or oven, &c. as also the ring or compass of a wheel.

Apsis in ecclesiatical writers, denotes an inner part in the ancient churches, wherein the clergy sat, and where the altar was placed. It is supposed to have been thus called, because covered with an arch or vault of its own, by the Greeks called ads, by the Latins absis. Apsis, in this sense, amounts to the same with what is otherwise called choir, concha, camera, and presbyterium; and stands opposed to the nave or body of the church.

Apris is more particularly used for the bishop's seat, or throne, in ancient churches. This was peculiarly called apsis gradata, because raised on steps above the ordinary stalls.—It was also denominated exedra, and

in latter times tribune.

Arsis is also used for a reliquary, or case, wherein the relicks of saints were anciently kept. It took the name apsis, from its being round or arched at the top; or perhaps from the place where it was kept. The apsis was commonly placed on the altar: it was usually of wood, sometimes also of gold and silver, with sculptures, &c.

Arsis, in aftronomy, a term used indifferently for either of the two points of a planet's orbit, where it is at greatest or least distance from the sun or earth; and hence the line connecting those points is called the line of the apsides. The word is Greek, and derived from arra, to conned. The apsis, at the greatest distance from the sun, is called the apselion, and at the greatest distance from the earth the apogee; while that at the least distance from the sun is termed the perihelion, and at the least distance from the earth the periherion,

APSIRTIDES. See ABSORUS.

APTA, or APTA JULIA, (Pliny); now Apte, in Provence, on the river Calavon, seven leagues to the north of Aix, and nine to the north of Avignon. In the Notitize it is called Givitas Aptenfium: Pliny reckons it among the Latin towns. That it was a colony, appears from an inscription on a stone found at Arles, (Sirmond). E. Long. 5. 56. Lat. 43. 23. APTERA,

Aptera Apuleius,

APTERA, (Strabo, Stephanus); APTERON, (Pliny); APTERIA, (Ptolemy: An inland town of Crete, whose port was Cisamus, on the west side of the island, (Strabo); 12 miles to the south of Cydonia towards the Montes Leuci, and as many from the Sinus Amphimales. So called from the Sirens, who, being there vanquished in song by the Muses, stript themselves of their wings, and out of grief leaped into the sea, (Stephanus). There was a town of Lycia of the same name. E. Long. 25. Lat. 35. 50.

ATTERA, a term used by Linnæus for his seventh order of insects, comprehending such as have no wings.

APTHANE, a title anciently given to the higher degrees of nobility in Scotland. See THANE.

APTITUDE, (from aptus "fit"), the natural difposition any thing hath to serve for such or such a purpose.—Thus, oil hath an aptitude to burn, and water to extinguish fire.

APTITUDE, or APTNESS, is often used, in speaking of the talents of the mind, for a promptitude, or disposition to learn things with ease and expedition. In which sense aptness amounts to the same with what the Greeks call supeable, bona incloses, and we sometimes dorility. Charlton divides aptness into these parts, viz. acuteness, sagacity, and memory.

APTOTE, among grammarians, an indeclinable noun, or one which has no variation of cases.

APULEIUS (Lucius), a Platonic philosopher, univerfally known by his performance of the Golden Als. He lived in the fecond century, under the Antonines; and was born at Madaura, a Roman colony He studied first at Carthage, then at Athens, and afterwards at Rome, where he learned the Latin tongue without the help of a master. He was a man of a curious and inquifitive disposition, especially in religious matters: this prompted him to take feveral journeys, and to enter into feveral focieties of religion. He spent his whole fortune almost in travelling; fo that, at his return to Rome, when he was about to dedicate himself to the service of Osiris, he had not money enough to defray the expence attending the ceremonies of the reception, and was obliged to pawn his clothes to raise the necessary sum. He supported himself afterwards by pleading causes: and as he was a great master of eloquence, and of a subtle genius, many confiderable causes were trusted to him. But he availed himself more by a good marriage than by his pleadings: a widow, named Pudentilla, who was neither young nor handsome, but wanted a husband and was very rich, took a great fancy to him. This marriage drew upon him a troublesome law suit. The lady's relations, pretending he made use of forcery to gain her heart and money, accused him of being a magician before Claudius Maximus proconsul of Africa. Apuleius was under no great difficulty of making his defence. As Pudentilla was determined from confiderations of health, to enter upon a fecond marriage, even before the had feen this pretended magician, the youth, deportment, pleasing conversation, vivacity, and other agreeable qualities of Apuleius, were charms fufficient to engage her heart. He had the most favourable opportunities too of gaining her friendship, for he lodged some time at her house: Pudentilla's eldest son having a great friendship for him, was likewise desirous of the match, and folicited him in favour of Pudentil- Apuleius la. "Do you make a wonder (faid Apuleius, in his defence) that a woman should marry again, after having lived a widow 13 years? it is much more wonderful that she did not marry again sooner. You think that magic must have been employed to prevail with a widow of her age to marry a young man; on the contrary, this very circumstance shows how little occasion there was for magic." He offered to prove by his marriage contract, that he got nothing of Pudentilla but a promife of a very moderate fum, in case he survived her and had children by her. He was also obliged to make fuch confessions in court as Pudentilla would gladly have excused. He faid she was neither handfome nor young, nor fuch as could any ways tempt him to have recourse to enchantments: moreover, he added, that Pontianus her fon propofed the marrying his mother to him only as a burden, and the action of a friend and philosopher. He also took notice of many inconveniences which attend the marrying of widows, and fpoke highly of the advantages of a maid above a widow: A handsome virgin (said he), let her be ever so poor, is abundantly portioned; the brings to her husband a heart quite new, together with the flower and, first fruits of her beauty. It is with great reason that all hutbands fet fo great a value upon the flower of virginity: all the other goods which a woman brings her husband are of such a nature, that he may return them again, if he has a mind to be under no obligation to her: that alone cannot be reflored, it remains in the possession of the first husband. If you marry a widow, and she leaves you, she carries away all that she brought you." Upon which passage Mr Bayle makes a very coarfe remark, viz. "That this good which is never taken back out of the hands of a hulband, is very chimerical; and that there is never a baker nor a butcher, who would lend fixpence upon this unperishable possession." The apology is still extant, and is reckoned a very fine piece. Apuleius was extremely indefatigable in his studies: and composed several books, some in verse, and others in prose; but most of them have been loft. He took great pleasure in declaiming, and was heard generally with great applause: When he declaimed at Oeca, the audience cried out with one voice, that they ought to confer upon him the honour of citizen. The citizens of Carthage heard him with great satisfaction, and erected a statue to him; and several other cities did him the same honour. Several critics have published notes on Apuleius's Golden Ass, and there have been translations of it into different languages.

APULIA, now Puglia, a territory of Italy, hordering on the Adriatic, and extending from the river Frento to Tarentum in length, and from the Adriatic to the Lucani in breadth. Apuli the people (Horace); divided into the Apulia Daunia, now called Puglia Pinna, or the Capitanata; and into the Apulia Peucetia, now Terra di Bari, (Pliny, Ptolemy). Apulia abounded in sheep, which yielded the since wool (Martial). It is now the east side of the kingdom of Naples.

APUS, Avis Indica, in aftronomy, a confellation of the fouthern hemisphere placed near the pole, between the triangulum australe and the chameleon, supposed to represent the bird of paradise.

APYCNI

APYCNI suoni, in music, sounds distant one or more octaves, and yet concord.

APYCNOS, in music, is faid of the diatonic genus, on account of its having spacious intervals, in comparison of the chromatic and enharmonic.

APYREXY, among physicians, denotes the intermission of a fever.

APYROUS, a word applied to denote that property of some bodies, by which they relist the most violent fire without any sensible alteration. Apyrous bodies ought to be diftinguished from those which are refractory. Refractory substances are those which cannot by violent heat be fused, whatever other alteration they may fustain. But a body, properly speaking, apyrous, can neither be fused by heat, nor can undergo any other change. Diamonds were long thought to be possessed of this property. But some late experiments have shown, that diamonds may be entirely dissipated or evaporated by heat, and are therefore not entitled to be ranked among apyrous substances. Perhaps there is no body in nature effentially and rigorously apyrous. But it is sufficient that there be bodies apyrous relatively to the degree of fire which art can produce, to entitle them to that name.

AQUA, a term frequently met with in the writings of phylicians, chemists, &c. for certain medicines for menstruums, in a liquid form, distinguished from each other by peculiar epithets, as Agua Alexiteria, Agua Aluminofa, Aqua Mirabilis, &c. for which see Phar- a place of the Belgæ in Britain, famous for its hot wa-

AQUA Extinda, or Extinguished Water, is aquafortis into which fome river water has been poured, in order to qualify it, and render it less corrosive. Its use is to get the filver from the aquafortis that ferved to part gold from it.

AQUA Fortis, a name given by artists to nitrous acid of a certain strength, from its dissolving power: that which is concentrated and smoking, is called spirit of nitre. The aquafortis used by dyers, brass founders, &c. is not only weaker than spirit of nitre, but contains a portion of vitriolic acid. It may be made by distilling crude nitre with calcined vitriol, equal parts. The nitrous acid, expelled by the vitriolic, will rife in red fumes, and pass into the receiver. The vitriolic acid, uniting with the alkaline basis of the nitre, forms vitriolated tartar; but, there being more vitriolic acid than is requifite to faturate the alkali, the furplus rifes with the nitrous acid: aquafortis, therefore, is a mixture of these two acids. It may also be made by di-Rilling crude nitre with fomewhat more than half its weight of oil of vitriol; or by mixing one part of oil of vitriol with nine parts pure spirit of nitre. See CHEMISTRY, Index.

Agua Marina, a name by which the jewellers call the beryl, on account of its sea-green colour. See

Agus Regia, a compound of nitrous and marine acid, in different proportions according to the purpose for which it is intended. It is usually made by diffolving in nitrous acid, fal ammoniac, or common falt, both which are combinations of marine acid with alkah. When made with sal ammoniae, the common proportion is one part of this falt to four parts of nitrous acid; but to dissolve platina, equal parts are requisite. A purer aqua regia may be made by fimply mixing the two acids.

Aqua regia is particularly used as a menstruum for gold; it likewise dissolves all other metals, except silver. The gold dissolved in aqua regia is, in fact, dissolved in the dephlogisticated marine acid only, which, being deprived of its phlogiston by the nitrous acid, recovers it from the gold, and thus renders gold foluble; for metals are not foluble in acids until they lose a part of their phlogiston. See CHEMISTRY, Index.

Agua Secunda, aquafortis diluted with much pure water. It is employed in several arts, to clean the surface of metals and certain stones, and for various other

purposes.

Agua Vite, is commonly understood of what is otherwise called brandy, or spirit of wine, either simple, or prepared with aromatics. Some, however, diftinguish between them; appropriating the term brandy to what is drawn from wine, or the grape; and aqua vite to that drawn after the same manner, from malt,

AQUE Augusta (Ptolemy); Aqua Tarbellica, (Antonine); Aquensis Civitas, in the Notitia. Now Acqs, or Dax, a town in Gascony, on the river Adour, famous for its baths. W. Long. 1. 40. N. Lat. 43. 56.

AQUE Bilbilitane, (Antonine): baths 24 miles to the west of Bilbilis. Now Banos de Albama, in Arra-

Agua Calida, (Ptolemy); Agua Solis, (Antonine); ters. Now Bath in Somersetshire. W. Long. 1. 5.

Aguze Calide, (Ptolemy); Aquicaldensis, (Pliny); formerly in great repute, and a public bath; whose ruins still remain testimonies of the Roman grandeur. Now Orense, in Galicia, still famous for its baths; on the river Minho, 54 miles fouth-east of Compostella. W. Long. 8. 30. Lat. 42. 30. Also a place in the bay of Carthage, (Strabo). Other Aquicaldenses, to the north of Gerunda in Catalonia, (Ptolemy).

Agua Calida, a colony between the rivers Serbetes and Savus, in Mauritania Cæfarienfis (Ptolemy).

Agua Celenia, (Ptolemy); or Cilina, (Antonine). Now Caldas, a hamlet on the Minho, in Galicia.

AQUE Convenarum, a hamlet of Gaul, in Aquitaine, (Antonine), and on the borders of the Convenæ, or le Cominge, at the foot of the Pyrenees, near the fource of the Garonne. Now Bagneres. W. Long. 3. 39. Lat. 42. 20.

Agua Cutilia, a lake of the Sabines, in the territory of Reate (Pliny); Lacus Cutilienfis, (Varro); with a moveable island in it, (Seneca, Pliny); supposed to be the centre of Italy, (Varro). The waters were medicinal, and extremely cold, good for a weak stomach and in weak nerves; they feemed to act by a kind of fuction, which approached to a bite, (Pliny). Vefpafian used them every summer; and there he died, (Sueton. Xiphilin from Dio). Now Lago di Contigliano.

Agua Plavie, a town on the confines of Galicia and Portugal, fo called from Vefpafian and Titus. The inhabitants are called Aquiflavienses on coins. Now called Chiaves, a mean hamlet: but the ruins of its bridge testify its former grandeur. W. Long. 6. 6. Lat. 41. 40.

Aqua Helvetia, described by Tacitus as a municipal town, and much frequented for its excellent water; and though he does not mention its name, Cluverius

fuppoles

Aquadud. Supposes it to be Baden, in Switzerland, on the rivulet Limat, which foon after falls into the Aar. It is called the Upper, to distinguish it from another called the Lower Baden, in Alface. E. Long. 8. 49. Lat. 47. 55.

AQUE Meron (Joshua), samous for the defeat of Jabin: supposed to be the lake called Samachonitis, or Semechonitis, by Josephus; into which the river Jordan falls, before it comes to the sea of Genesereth, or Ga-

Agun Pannonie, famous baths of Austria, now called Baden, 28 miles to the fouth of Vienna.

AQUE Patavine, are boths in the territory of Venice near Padus, (Pliny); called Fontes Aponi (Livy, Martial). Now Bagni d' Abano. E. Long. 13. 48. Lat. 45. 15.

Agum Quintiana, put by Ptolemy in room of the Aque Ciline of Antonine. Now supposed to be Sarria, a town of Galicia, on a rivulet of the same name,

three leagues to the fouth of Lugo.

Agua Sextia, a colony to the north of Marseilles, fo called both from the founder Sextius Calvinus, and from its quantity of water, and number of cold and hot fprings; built after the defeat of the Salyes, or Salvii, whose territory in the fouth of Provence reached from the Rhone to the borders of Italy, (Livy, Velleius, Strabo, Ptolemy). By an inscription the colony appears to have been either increased or renewed by Augustus. In the Notitia it is called Civitas Aquenfis. Now Aix. Here the Teutones and Cimbri were defeated with great slaughter by Marius. E. Long. 6. 4. Lat. 48. 4.

Agum Statielle, or Statiellorum, (Pliny), a town in Liguria, on the river Bormia. Now Acqui, a town of

Montferrat. E. Long. 8. 40. Lat. 44. 45.

Agua Tauri, hot waters or baths in Tuscany at the distance of three miles from the sea, said to be discovered by a bull, hence the appellation. There are still to be seen the ruins of these baths. Now Aquespendente, in Orvieto. E. Long. 12. 40. Lat. 42. 40.

AQUÆDUCT, in hydraulics and architecture, a structure formed for conveying water from one place to another, over grounds that are unequal. The word is compounded of the Latin substantive aqua water, and dutius a channel by which that water may be conducted.

Architects distinguish two kinds of aquæducts; the visible, and the subterraneous .- The visible are constructed in valleys or marshes, and protracted in longitude or latitude as the fituation requires. They are composed of adminicula for supporting the arches and confining the stream, and of arcades .- The fubterraneous are formed, by piercing the mountains, and conducting them below the furface of the earth. They are built of stone hewn or rough: and covered above with vaults, or with flat stones, which may be termed flags; these flage shelter the waters from the heat of the fun.

They divide them still into double and triple aqueducts; that is to fay, such as are supported either by two or by three ranges of arcades. Such was the aquæduct which Procopius records to have been built by Cofroes king of the Perfians, for the city of Petra in Mingrelia: it had three conduits upon the fame line,

each elevated above the other.

Frequently aquaducts are paved. Sometimes the waters flow through a natural channel of clay. Fre-

quently they are conveyed by pipes of lead into refer- Aquedact. voirs of the same metal, or into troughs of hewn stone. The channels are cut with an imperceptible descent, that the current may be accelerated by its own weight. Parallel to its course, on each side, is cut a narrow footpath, where people may walk when necessary. By conduits, or grooves, the waters are conveyed into large cisterns, but not forced above their original level. To make them rife and iffue from their apertures with force, they must be confined in tubes of a small diameter, and abruptly fall from a confiderable declivity.

Aquæducts of every kind were long ago the wonders of Rome; the vast quantity of them which they had; the prodigious expence employed in conducting waters over arcades from one place to another, at the distance of 30, 40, 60, and even 100 miles, which were either continued or supplied by other labours, as by cutting mountains and piercing rocks; all this ought to furprife us; nothing like this is undertaken in our times; we dare not even think of purchasing public conveniency at fo dear a rate. Applies the cenfor advised and constructed the first aquæduct. His example gave the public luxury a hint to cultivate these objects; and the force of prodigious and indefatigable labour diverted the course of rivers and sloods to Rome. Agrippa, in that year when he was ædile, put the last hand to the magnificence of these works. It is chiefly in this respect that the modern so much resembles the ancient city of Rome. For this advantage, the is peculiarly indebted to Sextus V. and to Paul V. who for grandeur and magnificence emulated the masters of the universe *. There are still to be feen, in different places Memoirs contiguous to Rome, striking remains of these aque-of Italy, ducts; arches continued thro' a long space, over which Vol. 1. were extended the canals which carried the water to the city. The arches are fometimes low, fometimes raised to a vast height, to humour the tumidities or depressions of the ground. There are some which have two arcades: one constructed above the other; and this precaution was observed, lest the height of a single arcade, if extended as far as the fituation required, might render the structure less firm and permanent. They are commonly of bricks; which by their cement cohere fo ftrongly, that the parts are not separated without the utmost difficulty .- When the elevations of the ground were enormous, it became necessary to form fubierraneous aquæducts. These carried the waters to such aquæducts as were raised above ground, in the declivity or at. the foot of mountains. If the artificial channel of the water was not susceptible of a downward bias but bypassing through a rock, through this they cut a passage at the same height with the superior aquaduct : such a one may be seen above the city of Tivoli, and at the place called Vicavaro. The canal which formed the course of the aqueduct is hewn out of the rock to the extent of more than a mile, about five feet in height and four in breadth.

There is one thing, however, which deferves to be remarked. It is, that these aquæducts, which might have been directed in a ftraight line to the city, did not arrive at it but by frequent and winding mazes. Some have faid that this oblique track was pursued to avoid the expence which must attend the building of arcades to an extraordinary height: others, that it was their intention to diminish the impetuosity of the current;

Vol. IV.

Aquædu& which, rolling in a straight line through an immense fpace, must always have increased its velocity, must have worn the canals by perpetual and forcible attrition, and of consequence afforded an impure and unwholefome draught to the inhabitants. But fince there was fo great a descent between the cascade of Tivoli and Rome, it is demanded why they should go to draw water from the same river at the distance of more than 20 miles higher; nay, of more that 30 miles, if we reckon the curvatures of its direction through that mountainous country? It is replied, the motive of obtaining the water more falubrious, and more limpid, was fufficient to make the Romans think their labour necessary, and their expence properly bestowed; and to those who reflect that the waters of this river were impregnated with mineral particles, and by no means wholefome, the answer will appear satisfactory.

If any one will cast his eyes upon Plate 128th of the Antiquities of Father Montfaucon, he will fee with how much care these immense works were constructed. From distance to distance spiramenta were left, that, if the water should happen to be stopped by any accident, it might gradually difembogue, till they could clear its ordinary passage. There were likewise, even in the very canals which conveyed the water, cavities confiderably deeper than its internal furface, into which the fifture was precipitated, and where it remained stagnant till it was refined from mud and feculence; and ponds, where it might expand itself till it was purified.

The aquæduct of the Aqua Marcia had an arch of 16 feet in diameter. The whole was composed of three different kinds of stone; one of them reddish, another brown, and a third of an earth colour. Above, there appeared two canals; of which the highest was fed by the new waters of the Tiverone, and the lower by what they call the Claudian river. The entire edifice is 70 Roman feet high. Near this aquæduct, we have in Father Montfaucon the plan of another with three canals; the highest supplied by the water called Julia, that in the middle from Tepula, and the lowest from the Aqua

The arch of the aquæduct of the Aqua Claudia is of hewn stone, very beautiful; that of the aquæduct of the Aqua Neronia is of bricks: they are each of them 72 Roman feet in height.

The canal of the aquieduct which was called the Aqua Appia, deferves to be mentioned for a fingularity which is observed in it; for it is not, like the others, plain, nor gradual in its descent; but much narrower at the lower than the higher end.

The conful Frontinus, who superintended the aquæducts under the emperor Nerva, mentions nine of them which had each 13,594 pipes of an inch in diameter. Vigerus observes, that, in the space of 24 hours, Rome received 500,000 hogsheads of water.

We might likewife have mentioned the aquæduct of Drufus, and that of Riminius: but we shall satisfy ourselves with observing here, that Augustus caused all the aquaducts to be repaired; and afterwards pass to other monuments of the fame kind, and still more important, which give the most striking ideas of Roman magnificence.

One of these monuments is the aquaduct of Metz, of which a great number of arcades still remain. These areades croffed the Mofelle, a river which is broad Vol. II. Part I.

and vaft at that place. The copious fources of Gorze Aquamboe furnished water for the representation of a lea fight. This water was collected in a refervoir: from thence it Aquarius. was conducted by fubterraneous canals formed of hown flone, and fo spacious that a man could walk erect in them: it traverled the Mofelle upon its superb and lofty arcades, which may still be feen at the distance of two leagues from Metz; fo nicely wrought and fo firmly comented, that, except those parts in the middle which have been carried away by the ice, they have retified, and will ftill refift, the fewerest shocks of the most violent scasons. From these areades, other aquieducts conveyed the waters to the baths, and to the place where the naval engagement was mimicked.

If we may trust Colmenarus, the aquaduct of Segovia may be compared with the most admired labours of antiquity. There still remain 159 arcades, wholly confifting of stones enormously large, and joined without mortar. These areades, with what remains of the edifice, are 102 feet high; there are two ranges of arcades, one above another. The aquadud flows through the city and runs beneath the greatest number of houses which are at the lower end.

After these exorbitant structures, we may be in some degree believed when we speak of the aquadud which Louis XIV. caused to be built near Maintenon, for carrying water from the river Bucq to Verfailles: it is perhaps the greatest aguaduct which now subsists in the world: it is 7000 fathoms in length, and contains 242 arcades.

AQUAMBOE, one of the greatest monarchies on the coast of Guinea in Africa, stretching 20 miles in breadth, and ten times that space in length from east to west. According to Bosnian, the coast is divided into a great number of petty royalties, but all of them fubject to the king of Aquamboe, who indifcriminately uses an unlimited authority over them and the meaneit of his subjects. His despotism gave rife to a proverbial faying, that " there are only two ranks of men at Aquamboe; the royal family, and flaves." The natives of this country are haughty, turbulent, and warlike; and their power is form dable to all the neighbouring nations. They grievoidly infest fuch nations as are tributaries to the king of Aquamboe, entering their territories by troops, and corrying off from the inhabitants whatever they think proper; por do they ever meet with any opposition from the inhabitarts, as they are fenfible the king would not fail to rejent this as an indignity offered to him.

AQUAPENDENTE. See FABRICIUS.

AQUARIANS, Christians in the primitive church who confecrated water in the eucharift initead of wines This they did under pretence of abilimence and ten; rance; or, because they thought it universally unlawful to eat flesh or drink wine. Epiphanius calls them Encratites, from their abilinence; St Autin, Ag. :rians, from their use of water; and Theodoret, who fays they sprang from Tatian, Hydropora law, because they offered water instead of wine.

Besides these, there was another fort of Aquariana, who did not reject the use of wine as unlawful; for they administered the eucharist in wine at evening service: but, in their morning affemblies, they used water, for fear the fmell of wine should discover them to the heathers.

AQUARIUS, the water-carrier, in aftronomy,

Aquila.

Aquartia the 1 th fign in the zodiac, reckoning from Aries; from which also the 11th part of the ecliptic takes its name. Aquatinta. -The fun moves through Aquarius in the month of January; it is marked thus, 🗯.

The poets feign, that Aquarius was Ganymede, whom Jupiter ravished under the shape of an eagle, and carried away into heaven, to ferve as a cup-bearer, in the room of Hebe and Vulcan; whence the name.--Others hold, that the fign was thus called, because, when it appears in the horizon, the weather usually proves rainy.

The flars in the confellation Aquarius, in Ptolemy's catalogue, are 45; in Tycho's 41; in Hevelius's 47;

in Flamsted's 108.

AQUARTIA, in botany, a genus of the tetrandria monogynia class. The calyx is campanulated; the corolla is rotated, with linear divisions; and the berry is four feeded. There is but one species, the aculeata, a native of America.

AQUATIC, in natural hiltory, an appellation given

to fuch things as live or grow in the water.

AQUATINTA, a method of etching on copper, lately invented, by which a foft and beautiful effect is produced, refembling a fine drawing in water colours or Indian ink.

Previous to the operation upon the plate, the following powder must be prepared.—Take of asphaltum and fine transparent rolin, equal parts, suppose two ounces of each, and pound them separately. Through a muslin sieve (which may be formed with part of a chipbox of three or four inches diameter) fift upon a fleet of paper a thin stratum of the asphaltum, above which fift a fimilar layer of the rofin, and upon this another layer of asphaltum, continuing these alternate layers till both of the powders are exhaulted: then pass the mixture through the same sieve upon the paper once or twice, or till both appear to be fufficiently incorporated; when the powder is ready for use. Some, inflead of the above mixture, use gum fandarach pounded.

The main process is as follows:—A copperplate being polified in the usual way, lay the etching ground upon it, and etch the outlines of your defign in the manner directed under the article ETCHING: The ground is then to be foftened with a little greafe, and wiped off with a piece of rag: leaving, however, as much greafe upon the plate as just to dim the copper. You now fift your powder upon the surface of of the plate; after which, flrike the other fide of it pretty imartly against the edge of the table, in order to discharge it of the loose powder: This done, with a hand-vice hold the back of the plate over a chaffing dish of charcoal fire, till it become so hot as to give pain upon being touched with the back of the hand; and the powder which adhered to the greafe will now be fixed to the plate. The plate being then fullered to cool, take turpentine varnish mixed with ivory black; and with a hair pencil dipt in it, cover all the lights or places where there is no work or 🦟 🏙 des. A rim or border of bees wax is now to be raifed round the plate: Then having reduced the aquafortis to a proper strength by vinegar or water, you pour it on, and let it flaud five minutes for the first or lightest frace: after which, pour it off; and having washed the plate with water, fet it on edge to dry: Then with

the varnish stop up your light shades, pour on the aqua- Aquatints fortis for the fecond tint, and let it stand five minutes more; proceeding in the same manner for every tint till you produce the darkeft shades. If a bold open ground ' is wanted in any part, this requires an after operation: The ground must be laid as the other, by fifting on the powder; only this powder is much coarfer, and the plate must be much more heated in order that the particles of the powder may spread, and form small circles: even good clean rofin will do by itself.

In etching landscapes, the sky and distant objects are also performed by a second operation, and the powder is fifted upon the plate with a finer fieve. If the trees or any part of the fore-ground require to be higher finished, the plate must be entirely cleanfed from greafe with bread, and a ground laid in the common way of etching; when you may finish as highly and neatly as you please with the needle or point, by stippling with dots, and biting up those parts, or by a rolling-wheel.

The preceding is the method for prints of one fingle tint. But if different colours are the expressed, there will be required as many different plates, each plate having only the part etched upon it which is deligned to be charged with its proper colour: unless (as may happen in particular subjects) some of the colours are fo distant from each other as to allow the printer room to fill them in with his rubber without blending them; in which case, two or more different colours may be printed from the same plate at once.-Where different plates are necessary, a separate one, having a pm in each corner, must be provided as a fole or bottom to the aquitinta plates; and these again must be exactly fitted, having each a small hole in their corners for palfing over the pins of the fale; the faid pins ferving the double purpose of retailing the places successively in their due position, and of directing the printer in placing the paper exactly on each plate so as not to shift; by which means each tint or ensure will be exactly received on its proper place. This is the method practised at Paris. A landscape or similar subject, however, may be printed off at once in the different proper colours, by painting these upon the plate. In this case, the colours must be pretty thick in their consistence; and the plate must be carefully wiped in the ufual way after the laying on of each tint, as well as receive a general wipe upon its being charged with all

This art is kept as secret as possible by those who practife it; and it is believed that no particular explanation or directions, before the prefent, have been communicated to the public. In order to fucceed, however, great care and judgment are requifite; and much depends upon a certain nicety of management, which is only attainable by practice.

AQUAVIVA, a town of the kingdom of Naples,

and province of Bari.

AQUEDUCT. See AQUEDUCT.

AQUEOUS, in a general fense, something partaking of the nature of water, or that abounds with it.

Aguinus Humour. See Anatomy, p. 767.

AQUILA, in ornithology, a fynonyme of the eagle. See FALCO.

Aquila, the Eagle, in aftronomy, a constellation of the northern hemitphere; ufually joined with Antinous.

Aquilegia. The stars in the constellation Aquila and Antinous, in · Ptolemy's catalogue, are 15; in Tycho's 19; in Hevelius's 42; in the Britannic catalogue, 71.

Action, a fine large city of Italy, and the capital of Abruzzo, feated on a hill, on the banks of the river Pelearo, near its fource. It has an ancient callle, and is a bishop's fee immediately under the pope. The land about it produces great plenty of faffron. It was very near being all destroyed by an earthquake, in February 1703. The first shock was so terrible, that the inhabitants abandoned the city; but returning to vefpers, it being Candlemas day, the shocks followed one another with fuch violence, that 24,000 people perished, and great numbers were wounded; 800 were killed in one fingle church; many other churches, monafteries, noble buildings, and the town house, were either fwallowed up or overturned, together with the greater part of the city and its walls. Aquila stands 30 miles from the fea, and about 16 from the confines of the pope's dominions. E. Long. 14. 20. N. Lat.

AQUILEGIA, COLUMBINE: A genus of the pentagyma order, belonging to the polyandria class of plants; and, in the natural method, ranking under the 26th order, Multiflique. It has no calyx; the petals are five, with a horn-like nectarium inferted between each; and there are five feparate capfules.

Species. 1. The vulgaris, or wild columbine, with blue flowers, is found growing wild in some woods of England. 2. The alpina, with long oval flowers, grows naturally near Ingleborough hill in Yorkthare. The flowers are much larger than those of the garden columbine. 3. The inverte or garden columbine. Of this there are great varieties, not only in the colour and fulness of their flowers, but also in their form. These are commonly called rose columbines; the colours are chesnut, blue, red and white, and some are finely variegated with two colours. There are others with tharp pointed petals in form of a flar, and of these there are fingle and double flowers of the fame colours with the former. 4. The canadenfis, or Canada columbine, flowers almost a month before the other forts, and therefore is preserved in the gardens of the curious, though not at all remarkable for its beauty. There is a variety of this with taller flower fleins.

Culture. These plants are all propagated by sowing the feeds, or parting the old roots; but the former method is chiefly practifed, for the old roots are very apt to degenerate. The feeds should be fown in a nurfurybed in August or September; for those which are kept till the fpring feldom grow well, or at least remain in the ground a whole year. The fpring following the plants will appear above ground, and should be kept clear of weeds; and if the feafon proves dry, they mull be watered. In the middle or latter end of May, they will be firong enough to transplant; for which purpose, some beds of good undunged earth should be prepared, planting them therein at eight or nine inches diffance from each other. In the following autumn, by which time the plants will have acquired ftrength enough to flower the year following, the roots fhould be carefully taken up and planted in the borders of the flower garden: but where their roots are defigned to be preserved in perfection, all the flower stalks must be cut off as foon as the flowers are pait. In order to keep up a fuccession of good flowers, fre'h sceds should Aquilcia. be fown every year; and it will likewife be advantageous to exchange the feeds with fome brought from a diffant place.

Medicinal Uses. Columbine has been looked upon as aperient; and was formerly in great effect among the common people for throwing out the small-pox and meafles. A diffilled water, medicated vinegar, and conferve, were prepared from the flowers; but they have long given place to medicines of greater ef-

AUUILEIA, a large city of the Carni, or Veneti. and a noble Roman colony, which was led thither between the first and second Maccdonian wars, (Livy). It is washed by two rivers, the Natiso and Turrus, (Pliny). The reason of leading this colony was, in order to be a bulwark against the neighbouring barbarians. The colony was afterwards increased with 1500 families by a decree of the fenate, (Livy); from which it became a very famous port town, (Herodian). The emperor Julian aferibes the appellation to the augury of an eagle at the time of building it; bit Ifeac Vossius on Mela, to the great plenty of water, as if the town were called Aquilegia. The harbour, at the mouth of the Natifo, is diffrat 65 Radia from the city; fo that thips of burden are towed up the river, (Strabo). In 452 it was belieged by Attils with an innumerable hoft of barbarians. The walls were affaulted by a formidable train of battering rams, moveable turrets, and engines, that threw dones, duris, and fire; and the monarch of the Huns engloyed the forcible impelfe of hope, fear, emulation, and interest, to subvert the only burrier which delayed the conquest of Italy. Aquilcia was at that period one of the richeil, the most popolous, and the itrongest of the maritime cities of the Hadriatic coast. Three mouths were contumed without effect in the fiege; till the want of provisions and the clamours of his army compelled Attila to relinquish the enterprise, and reluctantly to iffue his orders that the troops should strike their tents the next morning and begin their retreat. But as he rode round the walls, pentive, angry, and difuppointed, he observed a flork preparing to leave her nest in one of the towers, and to fly with her i fam family towards the country. He feized, with the ready penetration of a flatefinan, this trifling incident which chance had offered to superflition; and exclaimed, in a loud and cheerful tone, that fuch a domestic bird, fo constantly attached to human fociety, would never have abandoned her ancient feats, unless those towers had been devoted to impending ruin and folitade. The favourable omen inspired an assurance of victory; the fiege was renewed and profecuted with fresh vigour; a large breach was made in the part of the wall from whence the flork had taken her flight; the Huns mounted to the affault with irrefillable fury; and the fucceeding generation could fearcely discover the ruins of Aquileia. The place, however, which is flill called Aquileia, there are several inscriptions and antiquities to be feen in it, which are worthy of a traveller's notice; and, though dwindled into a poor village, it gives a title to the patriarch of Aquileia. The patriarch is named by the Venetians, and relides at Udino, because the town of Aquileia belongs to the House of Austria. E. Long. 13. 30. N. Lat. 46. 20. AQUILICIUM,

Aquilicium Aquinum.

AQUILICIUM, or AQUILICIANA, in Roman antiquity, facrifices performed in times of excessive drought, to obtain rain of the gods.

AQUILINE, fomething belonging to or refembling an eagle: Thus an aquiline nose is one bent

Iomewhat like an eagle's beak. -

AQUILO, is used by Vitruvius for the north-east wind; or that which blows at 45° from the north toward the east point of the horizon .- The poets gave the name aquilo to all stormy winds dreaded by the ma-

AQUILUS, among the ancients, a dark, or dusky colour approaching to black. Hence some of the Heathen gods were called dii aquili, q. d. nigri.

AQUIMINARIUM, in autiquity, a kind of lustral veffel, wherein the Romans carried their holy water for

expiation and other religious offices.

AQUINAS (St Thomas), flyled the Angelical Doctor, was of the ancient and noble family of the counts of Aquino, descended from the kings of Sicily and Arragon; and was born in the castle of Aquino, in the Terra di Lavora in Italy, in the year 1224 or 1225. He entered into the order of the Dominicans; and, after having taught school divinity in most of the univertities of Italy, at last settled at Naples; where he spent the rest of his life in study, in reading of lectures, and in acts of piety; and was so far from the views of ambition or profit, that he refused the archbishopric of that city, when it was offered him by Pope Clement IV. He di d in 1274, leaving an amazing number of writings, which were printed at Vemice in 17 vols. folio, in the year 1490. He was canonized by Pope John XXII. in the year 1323; and Pius V. who was of the same order with him, gave him, in 1567, the title of the Fifth Doctor of the church, and appointed his festival to be kept with the fame folemnity as those of the other four doctors. His authority has always been of great importance in the schools of the Roman Catholics. Lord Herbert, in his life of Henry VIII. tells us that one of the principal reasons which induced that king to write against Luther was, that the latter had spoken contemptuously of Aquinas.

AQUINO (Philip d'), in Latin Aquinas or Aquinius, having turned from Indaism, had a pension from the clergy of France; and acquired much reputation by his knowledge of the Hebrew language, which he taught at Paris, in the reign of Louis XIII. and by the books he published, among which is his Didionarium Hebrao-Chaldao-Thalmudico-Rabbinicum. grandson, Anthony D'Anquin, was first physician to

Louis XIV.

Actino, a town of Italy, in the kingdom of Naples, and Terra di Lavora; a bishop's see, but ruined by the emperor Conrade, and now confilting of about 35 houses. It was the birth place of the poet Juvenal, and of Thomas Aquinas. E. Long. 14. 30. N. Lat.

AQUINUM (anc. geog.), a large municipal town, and a Roman colony on the horders of the Samnites, washed by the river Melpha (Strabo). The birth place of Juvenal, as he himself ichifies. The inhabitants are called Aguinates. Now Aquino, but almost in ruins, in the territory of Lavora. E. Long. 17. 11. N. Lat. 41. 35.

AQUITANIA (anc. geog.), one of the three prin- Aquitania cipal divisions of Gallia Comata (Cæsar); bounded by the Garonne, the Pyrenees, and the ocean: this is the Aquitania Cafariana, or Vetus. Augustus set the different boundaries, viz. the Loire, the Cevennes, the Pyrenees, and the ocean (Strabo). It was called Gallia Aquitanica (Pliny); and in the old Notitize, Provincia Aquitanica. The people are called Aquitani (Cæsar). Now comprising Guienne (which feems to be a corruption of Aquitania) and Gascony.

AR (anc. geog.), the metropolis of Moab, in Arabia Petræa (Moses); and the royal residence, situate on the cast side of the river Arnon. It was called also Rabba (Joshua); and to distinguish it from Rabba of the Ammonites, Rabbat Moab, and on coins Rabbath Moma (Reland). Eufebius fays it was called Areopolis in his time, from Ar and Polis. The inhabitants are called Areopolite. St Jerome fays that this city was entirely destroyed by an earthquake when he was a young man.

ARA THURIBULI, the altar Thicense, in astronomy, a fouthern confellation, not visible in our hemifphere, confifting, according to Ptolemy, of feven flars; and according to Sharp's Catalogue, annexed to that of Mr Flamited, of nine stars.

RA, in aftronomy, a fouthern conftellation, con-

taining eight stars.

ARAB, or Arabian Horse. See Equus.

ARABESQUE, or ARABESK, fomething done after the manner of the Arabians. Arabefque, Grotesque, and Morefque, are terms applied to fuch paintings, ornaments of friezes, &c. wherein there are no human or animal figures, but which confit wholly of imaginary foliages, plants, stalks, in the words take their rife from hence, that the Monay Arms, and other Mahometans, use these kinds of the stalks in figures of men or other a imals.

ARABIA, a country of Afia, famous from the remotest antiquity for the independency of its inhabitants during the valt conquests of the Assyrians, Persians, Greeks, and Romans; and, in later times, for being the centre of mempire equal, if not superior, in ex-

tent to any that ever existed.

This country, or at least the greatest part of it, was Whence in the earliest ages called Arabab. Concerning the named. etymology of which word there are various conjectures. It has most generally been derived from the Hebrew word, fignifying, the well, mixture, or traffic; but, according to M. Volney, Arab, in the ancient language of these countries, signifies a folitude or defert. It its largest extent, Arabia lies between the 12th and 35th degrees of N. Lat. and the 36th and 61st of E. Long. Its greatest length from north to south is about 1430 miles, and its breadth from east to well is 1200. It is bounded on the west by Palestine, Boundaries, part of Syria, the ifthmus of Suez, and the Red &c. Sea, called by the Arabs the fea Al Kolzom; on the east by the Euphrates, the Persian gulf, and bay of Ormus; on the north, by part of Syria, Divar-Beer, Irak, and Khuzestan; and on the fouth by the straits of Babelmandel and the Indian ocean. It grows narrower as we approach the frontiers of Syria and Diyar-Beer: and, by reason of the proximity of the Euphrates to the Mediterranean, may be looked upon as a pe-

Arabia. ninfula, and that one of the largest in the whole world. -Arabia Proper, however, is much narrower, including little more than what was comprehended by the ancients under the name of Arabia Felix, which we shall presently describe; and here the Arabs have been fettled almost fince the flood.

Division.

The first division of the peninsula of Arabia was into Arabah and Kedem, as we learn from Scripture; the first of which implies the west, and the other the east, denoting the fituation of the two countries. Ptolemy was the first who divided the peninsula we speak of into three parts, Arabia Petriea, Arabia Deferta, and Arabia Felix, which division has generally prevailed fince his time.

Arabia Petraa, on the east, was bounded by Syria and Arabia Deferta; on the well, by Egypt, or rather the ishmus of Suez which separates Asia from Africa, and the Hieropolitan gulf or western arm of the Red fea; on the north, by Palestine, the lake Afphaltites, and cooperation of the fouth by Arabia Felix. This tree did not admit of much cultivation, the greatest part being covered with dry fands, or using into rocks interspersed here and there with some fruitful spots. Its metropolis was Petra, which by the Syrians was flyled Rakam, and in Scripture Joktheel. Several other cities of Arabia Petræa are mestioned by Ptolemy; but as it is very improbable fuch a barren country should abound with large cities we must look upon them as inconsiderable places.

Arabia Deferta was bounded on the north by the Euphrates, which separated it from Mesopotamia; on the west, by Syria, Judæa, and Arabia Petræa; on the ealt, by a ridge of monatain which feparated it from Babylonia and Chaldead distribution, by Arabia Felix, from which it was the first operated by feveral ridges of hills. By farst the first part of this kingdom, as well as the forms the part of this kingdom, as well as the forms to be a first fand, or mou had confident of paked rocks and precipiers; nor first they filling of naked rocks and precipices; nor were they ever, unless sometimes at the equinoxes, refreshed with rain. The few vegetables which they produced were flinted by a perpetual drought, and the confilment af-forded them by the nocturnal dews will greatly impaired by the heat of the fun in the day-time. Throughout the deferts were found huge mountains of fand, formed by the violence of the winds that continually blew over them in the day-time, though they ceafed in the night. Wells and fountains were for the most part exceedingly rare; however, notwithstanding the sterility of these countries, the vast plains of fand just now mentioned were interspersed with fruitful spots, which appeared here and there like fo many islands in the midit of the ocean. Thefe being rendered extremely delightful by their verdure, and the more fo by the neighbourhood of those frightful deserts, the Arabs encamped upon them : and having confumed every thing they found upon one, removed to another, as is the cuflom of their descendants the Bedoweens at this day. These fruitful spots were likewise frequent in Libya, and by the Egyptians called autifes, or abafes, as we learn from Strabo. The barren part of Arabia Felix, bordering upon the Red sea, was in like manner interspersed with abases; which probably gave the name of Abasem to a nation settled there, and in the adjacent fertile region. A body of these, it is faid, crossing the straits of Babelmandel, passed into Ethiopia, Arabia. which from them received the name of Abassia. From this account of Arabia Deferta, we may reasonably conclude, that the towns faid by Ptolemy to have been fituated in it were places of very little confe-

Arabia Felix was founded on the north by the two kingdoms just described; on the south, by the Red sea; on the east and west, by part of that sea, together with the Arabian and Persian gulfs. In Strabo's time, it was divided into five provinces, by the oriental historians called Yaman, Hejaz, Tehama, Nojd, and Yamama. In this district stood several towns, particularly Nysa, famous for being the birth-place of Bacchus; and Musa, or Muza, a celebrated emporium or harbour, where the Arabian merchants reforted with their frankincense, fpices, and perfumes. These two were situated in the province of Yaman. In that of Hejaz flood the still more famous cities of Mecca and Medina; also Thaifa or Taifa, Giudda or Jodda, Yanbo or Al Yanbo, and Madian, the Modiana of Ptolemy, and the Midian or Madian of Scripture.

At what time the above-mentioned kingdoms were When peofirst peopled we have no certain accounts. The most rled. confiderable nations inhabiting Arabia Petrau, in the early ages, were the Ishmachtes, the Nabatæi or Nabatheans, the Cedraei or Kedarem, and the Agareni or Hagaren; and of these the Ishmaelites were the most powerful, if they did not comprehend all the reft; and if the Hagarem were not the fame people with them, they must at least have been nearly related. Kimchi, an oriental hiftorian, infinuates, that they were originally the children of Hagar by an Arab, after the had left Abraham. In ofter ages, the names of all the nations fituated here were absorbed in that of Saracens, by which the Ishmaelites are distinguished to the Jerufalem Targum. A nation also is mentioned by Pliny, called Arraccai, and Saraccai by Ptolency and Diofcorides, which was probably no other than the Ishmaelites above mentioned. In Arabia Deferta feveral tribes refided, all of whom were very obfeure, except the Affitæ and Agrai. The former are supposed by Bochart to have been Job's countrymen, and the latter to have been the fame with the Hagareni, Arraceni, or Saraceni, above mentioned. Arabia Felix was inhabited by many different tribes; the most remarkable of which were the Sabar, Gerrai, Minai or Minnai, Atramita, Maranitæ, Catabani, Afeitæ, Homeritæ, Sapphoritæ, Omanitæ, Saraceni, Nabathæi, Thamydeni, and Bnizomena; but neither their limits nor fituation can now be determined with any manner of precifion.

According to the oriental historians, the Arabs are Division of to be divided into two classes; viz. the old lost A.a. the Araba. bians, and the prejent. The most famous tribes among the former were those of Ad, Thamud, Tasm, Jades, Jorham, Amalek, Amtem, Halbem, Abil, and Bar. Concerning these, though now entirely lost and swallowed up among other tribes, there are fome remarkable traditions, of which the following may ferve as a fpecimen.

The tribe of Ad deduced their origin from Ad the Tradition fon of Aws, or Uz, the fon of Aram, the fon of Shem, concer ing who, after the confusion of tongues, settled in Al Ab- the tribe of kaf, or the winding fands in the province of Hadra-Ad. mant, on the confines of Yaman, where his posterity.

greatly

greatly multiplied. Their first king was Sheddad, the fon of Ad, who built a flately palace, and made a delightful garden in the deferts of Aden, which he defigned as an imitation of the celestial paradife. This garden he called Irem: and when it was finished, he set out with a great retinue to take a view of it; but, having fome thoughts of assuming divine honours, he was destroyed by a tempest from heaven, while yet a day's journey from his paradife. The garden and palace, however, were preferred, though invitible, as a monument of divine vengeance.

After the death of Sheddad, the kingdom of Ad was governed by a long feries of princes, concerning whom many fables are related by the eastern writers. The conclusion of their history, however, is as follows. "The Adites, in process of time, falling from the worship of the true God into idolatry, God sent the prophet Hûd, supposed to be the same with Heber, to preach to and reclaim them. But they refusing to acknowledge his mission or to obey him, God sent a hot and fuffocating wind, which blew feven nights and eight days, and entering at their nostrils passed through their bodies, and destroyed them all, a very few only excepted, who had listened to Hud, and retired with him to another place." Others relate, "that, before this terrible catastrophe, they had been previously chastised with a three years drought; and therefore fent Kail Ebn Ithar, and Morthed Ebn Sdaa, with 70 other principal men to Mecca, then in the hands of the tribe of Amalek, whose prince was Moawiyah Ebn Becr. to obtain of God some rain. Kail having begged of God that he would fend rain to the people of Ad, three clouds appeared, a white, a red, and a black one; and a voice from heaven ordered him to choose which he would. Kail failed not to make choice of the last, thinking it would be laden with most rain; but when this cloud came over them, it proved to be fraught with the divine vengeance, and a tempest broke forth from it which destroyed them all.

Arabs from fcended.

The prefent Arabs, according to their own histowhom de- rians, are sprung from Kahtan, the same with Joktan, the fon of Eber, and Adnan, descended in a direct line from Ishmael the son of Abraham. The former of these they called the genuine or pure Arabs, and the latter the naturalized or infititious Arabs.

loktan the fon of Eber had 13 fons, who some time after the confusion of languages settled in Arabia, extending themselves from Mesha to Sephar, a mountainous place in the fouth-eastern part of that peninfula. According to the Arabian historians, he had 31 fons, all of whom left Arabia and went into India, except two, viz. Yarab and Jorham; the former of whom, they fay, gave the name both to their country and language. Ishmael and his mother Hagar having been dismissed by Abraham, entered into the wilderness of Paran, as related in the book of Genesis. The sacred historian informs us, that during his residence in the wilderness he miried an Egyptian; and the Arabian writers fay the also took to wife the daughter of Modad king of Hejaz, lineally descended from Jorham the founder of that kingdom. By the Egyptian he was probably the father of the Scenite or wild Arabs; and having allied himself to the Jorhamites, he is considered by the Arabians as the father of the greatest part of their

Kahtan, or Joktan, is faid to have first reigned, and Arabia. worn a diadem, in Yaman; but the particulars of his reign we nowhere learn. He was fuce eded by Yarab 8 already mentioned, he by Yashab, and Yashab by Abd Joktan the Shems. He was incectaful in his expeditions against his enemies, carried off great spoils, and took many of them prisoners. He is faid to have built the city Refervoir of Saba or March, and above it a stupendous mound of Saba. or building which formed a vast refervoir, containing all the water that came down from the mountains. By means of this refervoir the kings of Yaman not only supplied the inhabitants of Saba and their lands with water, but likewife kept the territories they had fubdued in greater awe, as by cutting off their communication with it they could at any time greatly distress them.

Abd Shems was fucceeded by his fon Hamyar, from whom the tribe of Hamyar is faid to take its name; and he by a feries of 17 kings, concerning whom we have no remarkable particulars, except that from one of them called Africus, the continent of Africa took its name. The last of these was succeeded by a daughter Balkis sup named Balkis or Belkis, whom fome will have to be posed to be the queen of Sheba who paid a vint to Solomon. Af-Sheba, ter Balkis caine Malea, furnamed Nasherolneam on account of his magnificence and liberality. Having had bad fuccess in an expedition, where his army was overwhelmed by torrents of fand, he caused a brazen statue to be erected with the following infeription in the old Hamyaritic character. "There is no passage behind me, no moving farther; the son of Sharhabil." He was fucceeded by Shamar Yaraash, so called on account of his being affected with a constant tremor. To this Saniarcand prince the city of Samarcand is faid to owe its existence. by whom After Shamar Yaraash we have a lift of 15 kings, of built, whom nothing worth mentioning is recorded, except of one Abu Carb Asaad, who have corned the Caaba or temple of Mecca with tapeller, and first introduced Judaism to one the Hamyarites. He was put to death by his subjects probably on account of religion. The last of the 15 kings above mentioned was called Alrabah, who was succeeded by his son Sabban. He had that famous function called Samfannah, which afterwards came into the ands of the caliph Al Rashid. prince was fucceeded by Dhu Shanater, who had fix fingers on each hand. He was abandoned to unnatural lust, and dethroned for abusing some of the noblest youths in the kingdom. To him fucceeded Yusef, who yusef, a lived about 70 years before Mahomet. He perfecuted bloody per all those who would not turn Jews, putting them to secutor. death by various tortures, the most common of which was throwing them into a glowing pit of fire; whence he had the appellation of the lord of the pit. This perfecution is taken notice of in the Koran. The last of the Hamyaritic monarchs was Dhu Jadan, according to Abulfeda; but, according to others, the Yusef just mentioned, who was furnamed Dhu Nowas on account of his flowing curls, and was the last who reigned in an uninterrupted succession. He was a bigotted Jew, as already mentioned; and treated his subjects with such barbarity, that they were obliged to ask the assistance of Elesbaas, or Elasbaan, king of Ethiopia, against him. His subject Dhu Nowas, not being able to make head against the call in the Ethiopians, was at last driven to such extremity, that king of E. he forced his horse into the sca, and lost both his life thiopia, who and crown together.

The

Christian religion cflab! flied

driven out.

16 Terrible. inundation by the breaking down of the referou of

į,

Yaman, established there the Christian religion, and fixed upon the throne one Abryat an Ethiopian. He was fucceeded by Abraha-Ebn-Al-Sabah, furnamed the Slitnosed, from a wound he had formerly received in it. in Arabia. He was likewife flyled lord of the elephant, from a flory too ridiculous to deserve notice. He was succeeded by two other Ethiopian princes; but at last Sief Ebn Dhu Yazan, of the old royal family of Hamyar, having obtained affiftance from the king of Persia which had been denied him by the emperor Heraclius, recovered Ethiopians his throne, and drove out the Ethiopians; but was himself slain by some of them who were left behind. The fucceeding princes were appointed by the Perfians, till Yaman fell into the hands of Mahomet.

We have already taken notice of the vath mound or reservoir made by Abd Shems, from which he supplied the city of Saba with water. This building flood like a mountain above the city, and was by the Sabrans effected fo flrong, that they were under no fear of its ever failing. The water role almost to the height of 20 fathoms; and was kept in on every fide by a work fo folid, that many of the inhabitants had their houses upon it. About the time of Alexander the Great, however, a terrible inundation happened. According to the Arabian historians, God being displeased at the pride and insolence of the inhabitants of this city, refolved to humble them; and for this purpose sent a mighty flood, which broke down the mound by night whilft the inhabitants were affeep, and carried away the whole city with the neighbouring towns and people. This inundation is flyled in the Koran the inundation of Al-Haram; and occasioned so terrible a destruction, that from thence it became a proverbial faying to express a total dispersion, "that they were gone and scattered like Saba."—By this accident no less than eight tribes were forced to remove their habitations; some of which gave rife to the tingdoms of Hira and Ghassan.

The kingdom of Hire was founded by Malec, a de-Drigin, &c. f the king-scendant of Cahlan the brother of Hamyar; but after lom of H:- three descents, the throne came by marriage to the Lakhmians, who were descendants of Lakhm the son Amru, the fon of Abd Ems. There princes, whose general name was Mondar, preserved their dominion, notwithstanding some small interruption from the Perfians, till the caliphate of Abubeer, when Al Mondar Maghrur, the last of them, lost his life and crown by the arms of Khaled Ehn-Al-Walid. This kingdom continued 622 years and eight months, according to Ahmed Ebn Yuses. Its princes were under the protection of the kings of Persia, and were their lieutenants over the Arabs of Irak, as the kings of Ghassan were for the Roman emperors over those of Syria.

The kingdom of Ghaffan was founded by the tribe Of Ghaffan of Azd, who according to fome, fettling in Syria Damascena, near a water called Ghassan, from thence took their name; but others fay they went under this appellation before they left Yaman. Having driven out the Dajaamian Arabs, who before possessed the country, they made themselves masters of a considerable territory. Here they maintained themselves, according to fome 400, according to others 600, and according to Abulfeda 613 years, when the last of their kings submitted to the caliph Omar, and embraced the Mahometan religion; but receiving afterwards a difguil, focu

The king of Ethiopia, having thus become master of returned to Christianity, and took refuge in Constan. Atabit.

The kingdom of Hejaz was founded by Jorham the of Hejaz. fon of Kahtan, where princes of his line reigned till the time of Ishmael, who married the daughter of Modad one of those princes. Some authors relate that Kidar, one of Ishmael's fons, had the crown refigned to him by his uncles the Jorhamites: but, according to others, the descendants of Ishmael expelled that tribe; who, retiring to Johainah, were after various adventures destroyed by an inundation. After the expulsion of the Jorhamites, the government of Hejaz feems not to have continued long in the hands of one prince, but to have been divided among the heads of tribes, almost in the same manner as the Arabs of the desert are go-Tribe of verned at this day. The tribe of Khozaab, after the Khozaab above-mentioned inundation of Saba, fled into the king-affumes the dom of Hejaz, and fettled themselves in a valley call-governed Marri near Mecca. Here they founded an arif ment of tocracy, affuming to themselves both the government Mecca. of the city of Mecca, and the custody of the Caaba or temple there. They continued masters of this city and territory, as well as prefidents of the Caaba, for many ages, till at length one Kosa, of the tribe of Koreish, circumvented Abu Gabshan, a weak and filly man, of whom, while in a drunken humour, he bought the keys of the temple for a bottle of wine; but when Abu Gabshan grew cool, and restected on his imprudence, he sufficiently repented of what he had done; whence the Arabian proverbs, " More vexed with late repentance Folly of A. than Abu Gabshan; More foolish than Abu Gabshan," vu Gabshan. &c. The tribe of Khozaab endeavoured afterwards to give some disturbance to the Koreish in the possession of the keys of the Caaba, which furnished the latter with a pretence for depriving them of the civil government of Mecca. After the Koreish had possessed themselves of this city, they kept up the same form of government which had prevailed there before. Betides thefe kingdoms, there were many others of leffer note, of

which we find nothing remarkable. Thus we have briefly mentioned the most memorable events recorded by the Arabian historians previous to the time of Mahomet; but, before entering upon an account of that famous impostor and the kingdom founded by him, it will be proper to take notice of fiveral circumstances in different parts of the world, which at that time concurred to facilitate his scheme, and without which, in all probability, he would never have been able to accomplish it.

The first and great cause of Mahomet's success in Caust et his imposture, was the gross corruption and supersti- Mahomet's tion with which the Christian religion was at that time faccess. obscured in all parts of the world. Had the pure doctrines of Christianity been then as publicly known as the ridiculous fopperies which deformed the Eastern and Western churches, Mahometanism could never have got a hearing. But, along with the true religion, mankind feemed also to have lost the use of their rational faculties, so that they were capable of swallowing the groffest absurdities; such as it now appear; almost incredible that any of the human race could receive as truths. Another cause was, the manner of government and way of life among the Arabs. Divided into small independent tribes, they never were capable of a firm union but by superstition; and inch

Mah arac

Arabia. Mahomet attempted their conquest in any other way, it was impossible he could have succeeded. As there were also among them Jews, Pagans, and Christians of all forts, this impostor, by adopting fomething out of every religion then extant, cunningly recommended himself to the professors of every one of them. Add to all this, that by allowing of polygamy, and fetting forth his paradife as confifting in the enjoyment of women, he adapted himself to the corrupt dispositions of mankind in general.

> If the diffracted flate of religion favoured the defigns of Mahomet on the one hand, the weakness of the Grecian and Perfian monarchies affifted him no lefs powerfully on the other. Had those once formidable empires been in their vigour, either of them would have been sufficient to crush Mahometanism in its birth; but both of them were then flrangely reduced. The Roman empire had continued to decline after the time of Constantine; the western parts of it were then entirely over-run by the Goths and other barbarous nations; and the eaftern, or Greek empire, was fo much reduced by the Huns on the one hand, and the Persians on the other, as to be incapable of making any great effort. The Persian monarchy itself was in little better condition. It is true, they ravaged the dominions of the Greeks, and often oversame them in the field; but that was owing more to the weakness of the Grecian empire, than to the strength of the Persians, and fo effectually did the intelline broils, which arose chiefly on account of religion, weaken the kingdom of Persia, that the most considerable part of it was annexed by the caliph Omar to his dominions.

As the Greeks and Persians were then in a languishing fituation, fo the Arabs were strong and flourishing. Their country had been peopled at the expense of the Grecian empire; whence he violent proceedings of the different religious fectaries forced many to take refuge in Arabia. The Arabs were not only a populous nation but unacquainted with the luxuries and delicacies of the Greeks and Persians. They were inured to hardthips of all kinds, and confequently much better fitted than their effeminate neighbours to endure the fatigues of war, as the event very fully verified.

icent. &c.

Fehr head

of the Ko-

reish.

Mahomet was born in the year of Christ, 569. Ac-Mahomet's cording to the eathern hittorians, he was descended in a direct line from Ishmael. Kedar, or, as the Arabians call him Kidar, after his father Ishmael's death, communicated his name to the greatest part of Arabia Pe-He was fucceeded in his authority and possesfions by his fon Hamal; Hamal by Nabet, and Nabet by Salaman. After Salaman came Al Homeifa, then Al Yafa, whose fon Odad was succeeded by Odd the father of Adnan. Counting ten generations forward in the same line, we come at last to Fehr, who seems to have diftinguished himself by some glorious actions, as he was denominated Koreish, on account of his bravery. He is to be confidered as the root of the politch and most celebrated tribe of the Arabs. He had three sons, Gāleb, Mohāreb, and Al Hāreth. From Mohāreb the Mohāreb, denominated likewise Sheiban, took thair origin; from Al Hāreth, the Banu Al Kholoj: and from Galeb in a direct line, the impostor Mahomet. Gåleb was the father of Lowa; and he of Caab, whose fon Morrah had for his immediate descendant Kelab the father of Kofa. It was this Kofa who aggrandized

the tribe of the Koreish, by purchasing the keys of the Arabia. Caaba from Abu Gabshan, as we have already related. By this he not only aggrandized his tribe, but became the prince of it himself. He was succeeded by his second fon Abd Menaf, to whom the prophetic light, which is faid to have manifested itself in his face, gave the right of primogeniture. Abd Menāf was fucceed-Hafhem's ed by his fon Amn, furnamed Halbem, or "one that generouty. broke bread," on account of his fingular generofity during a famine at Mecca. Having amaffed great fums of money, he took a journey into Syria, where he purchased a valt quantity of meal, which he made into cakes, and divided with his own hands among ft the pcople of Mecca. He likewife killed a prodigious number of camels, with which he fed them, and relieved them in the time of their diffress: and finding that the foil about Mecca was so barren as to produce no fiuits but what are common in the deferts, and confequently no corn or grain, which the Meccans are obliged to bring from other places, he appointed two caravana to fet out yearly for that purpose, the one in summer, and the other in winter; by means of which the city was amply supplied with provisions of all kinds. The provisious brought by them, were distributed twice a year; and Hashem, by his prudent conduct, raised the glory of his people to the highest pitch; infomuch, that all the neighbouring great men and heads of tribes made their court to him. Nay, fo great veneration is the memory of Hashem held in by the Arabs, that from him the family of Mahomet among them are called Hashemites; and he who presides over Mecca and Medina, who must always be of the race of Mahomet, has to this day the title of the Chief or Prince of the Hashemites.

Hashem died at Gaza above, and was succeeded by his son Abdal Motalebook. He is faid to have been extremely affable and may of access, as well as just and generous to a great degree; so that, in the beginning of the month Ramadan, he entertained the poor upon the flat roof of his house, and afterwards supplied the fowls of the air and wild beasts of the field with provisions of various kinds, which he ordered his fervants to lead upon the fummits of the neighbouring mountains. The well which God showed to Hagar Well Zem in the wilderness is said to have been miraculously dis-zem discocovered to Abdal Motalleb, about 500 years after it vered by had been filled up by Amru prince of the Jorhamites. taleb. This well is by the Arabs called Zemzem; which some derive from her calling to Ishmael, when she spied it, in the Egyptian tongue, Zem, Zem i. e. Stay, Stay; though others ascribe it to a different origin. The water of this well, which is on the cast side of the Caaba, and covered with a small building and cupola, is highly reverenced; being not only drank with particular devotion by the pilgrims, but also fent in bottles as a great rarity to most parts of the Mahometan do-

Abdalla the father of Mahomet, was a younger fon of Abdal Motalleb, and remarkable for his beauty. In his 24th or 25th year, he married Amina, the daughter of Waheb, the fon of Abdal Menaf. She is represented as the most beautiful, prudent, and virtuous lady of her tribe; and consequently the most worthy

of such an extraordinary person as Abdalla. He died young, and, in his father's life-time, left his widow

27 Mahomet

t firft a

Arabia. and infant fon in very mean circumstances; his whole fubitance confitting only of five camels and one female Ethiopian flave. Abdal Motalleb was, therefore, obliged to take care of his grandfon Mahomet; which he not only did during his life, but at his death enjoined his eldeft fon Abu Taleb to provide for him for the future. Abu Taleb was extremely kind to his nephew, and instructed him in the business of merchandife; for which purpose he took him into Syria when he was but 13 years of age, recommending him to Khadijah, a noble and rich widow, for her factor; in whose service he behaved so well, that she married him, and thus raifed him to an equality with the richest in Mecca.

28 legins to proach his lostrine.

Though Mahomet had probably formed a defign of introducing his new religion pretty early, he did not think proper to avow it till the 40th year of his age. The grand article of his faith was, the unity of the divine nature, which he pretended was violated by the Jews and Christians no less than by the Pagans; for which reason, he resolved to make an attempt to rescue the world from the ignorance and fuperflition which prevailed at that time. This reformation he intended should begin in his own family; and therefore, having retired with his household to a cave in Mount Hara, near Mecca, he there opened the fecret of his million to Khadijah; acquainting her that the angel Gabriel had just appeared to him, and told him that he was appointed the Apostle of God. He also repeated to her a passage which he said had been revealed to him by the ministry of the angel, with an account of many prodigies which happened at his birth (See Mano-Khadijah with the grace joy; and in a kind of ecsta-fy she immediately communicated the good news to her cousin Warakis the Nawfal, who, being a Christian could write in the Hebrew character, and was pretty well versed in the Scriptures both of the Old and New Testament. He very readily came into her opiis wife and nion, fwore by God that what she faid was true, and oufin, &c. that " Mahomet was the great prophet foretold in the law by Mofes the fon of Amram."

Mahomet finding his first step seduccessful, as Waraka was a very confiderable person, began to entertain great hopes of accomplishing his design. He next converted his servant Zeid, to whom he gave his liberty on the occasion, which afterwards became a rule to his followers: and then Ali the son of Abu Talch, though at that time only nine or ten years of age. This laft, however, making no account of the other two, he used to call the first of believers. The next person he applied to was Abu Beer, a man of very confiderable authority among the Koreish. He was easily gained over, and by his influence feveral others; so that Mahomet now made his mission no longer a secret. Abu Beer he gave the name of Al Sadaik, or the faithful witness; because he not only vouched for every thing he faid, but also greatly increased the number of his followers. Mahomet likewife complimented him with the title of Aik, or preferved; intimating thereby that he was certainly faved from hell fire.

Having given out that he was commar ded from heaven to admonish his near relations, Mahomet directed Ali to prepare an entertainment, and invite to it the sons and descendants of Abdal Motalleb. He intended

Vol. II. Part I.

R to open his mind to them; but Abu Laheb, one of Arabia. Mahomet's uncles, making the company break up before the prophet had an opportunity of speaking to them, he was obliged to invite them again the next day. Having now proposed the matter, he asked which of them would become his wazir, prime minister, or vicegerent. This was accepted by Ali; upon which Mahomet faid to him, "This is my brother, my deputy, and my (caliph) successor, or vicar; therefore show yourselves submissive and obedient to him." At Rejected by this fpeech all the company fell a-laughing, telling Abu the Koreish. Taleb that he must now pay obedience and submission to his own fon. Notwithstanding this repulse, however, Mahomet was fo far from being discouraged, that he began to preach to the people in public. They heard him with some patience till he began to upbraid them with the idolatry, obstinacy, and perverleness of themselves and their fathers; which so highly provoked them, that they openly declared themselves his enemies, except some few who were converted. The prophet was now protected by the authority of his uncle Abu Taleb; who, however, was earnestly solicited to persuade his nephew to defift, and at last threatened with an open rupture in case he could not prevail on him so to do. This had such an effect upon Abu Taleb, that he

advised his nephew not to push the matter any farther; representing the great danger he and his followers would otherwise run: but our prophet was not to be fo intimidated; and told his uncle plainly, that " if His resoluthey fet against him the fun on his right hand, and the tion. moon on his left, he would not abandon his enterprife." Abu Taleb, therefore, finding him fo firmly refolved, used no further arguments, but promised to stand by him to the utmost of his power: so that notwithstanding the people of his tribe came to a determination to expel both Mahomet and his followers, he

found a powerful support in his uncle against all their machinations.

Mahomet now entered upon his apostolic function with uncommon diligence and application; and foon gained over his uncle Hamza, and Omar Ebn Al Khattah, a person very much esteemed, and who before had been his violent opposer. Notwithilanding this fuccess, however, the Koreish continued their op-His followpolition, and came to a refolution to proferibe all who emperfecuthad embraced Mahomet's doctrine. In confequence of ed. this refolution, the Moslems, as his followers were called, were now treated with fuch feverity, that they found it no longer safe to continue in Mecca; nay, several of them in the fifth year of his mission found themselves obliged to fly into Ethiopia, where they were kindly received by the Najashi or king of that country, who refused to deliver them up to those whom the Koreish fent to demand them. At this refusal they were so exasperated, that they came to a resolution to suppress effectually the new religion which had now made a confiderable progress. In order to this, they entered into a folema league or covenant against the Hathem-The Koreites, and the family of Abdal Motalleb in particu-ish enter inlar, engaging themselves to contract no marriages with to a league them, nor to have any manner of communication with against him. them otherwise; and, to give this the greater weight, they reduced it into writing, and laid it up in the Caaba. Upon this the tribe became divided into two factions; and all the family of Hashem, both Mos-

Arabia. Iems and unbelievers, repaired to Abu Taleb as their head; except only Abdal Uzza, surnamed Abu Laheb, the son of Abdal Motalleb, who, out of hatred to his nephew and his doctrine, went over to the opposite party. After this the authority of Abu Taleb was scarce sufficient to protect Mahomet from the fury of the Koreish; who, according to Al Jannabi, made frequent attempts upon him; fometimes endeavouring to destroy him by force, at other times by secret wiles and machination: nay, to compass their end, he tells us that they had recourse to magic, enchantments, and diabolical illusions. In short, they gave him at last so much trouble, that he was obliged to change his habitation, and feek a new afylum for himself and his companions. This he found in the house of one Orkam, which was advantageously situated on a hill called Safa. Here he converted Orkam's family, and the house was afterwards held in high estimation by the Moslems.

Koreish.

The two factions into which the tribe of Koreish was divided subfifted for five years, when they were Their wri - put an end to by a very strange accident. Mahomet ig destroy told his uncle Abu Taleb, that God had manifestly showed his disapprobation of the covenant entered into against them, by fending a worm to eat out every word of the instrument except the name of God. With this particular Abu Taleb immediately acquainted the Korcish; offering, in case it proved falle, to deliver up his nephew to them; but if it should prove true, he infifted that they ought to lay afide their animofity, and annul the league they had made against the Hashemites. To this they acquiesced; and going to inspect the writing, found it to be as Abu Taleb had told them; the words "In thy name, O God," being the only ones which remained. On fo remarkable a proof of the divine displeasure, the league was immediately annulled, and all acts of hostility between the

two parties ceafed.

After this memorable event Mahomet remained with his uncle Abu Taleb, who furvived the reconciliation only about eight months. The fame year also died Khadijah, Mahomet's wife. Her death, as well as that of his uncle, proved a great detriment to his affairs; for the Koreish, notwithstanding the former reconciliation, began now to profecute him with more violence ill perfe- than ever. He was therefore obliged to fly for shelter to ated by the Al Tayef; which he chose on account of its being the refidence of his uncle Al Abbas, whose protection he imagined he would be able to fecure. In this, however, he found himself mistaken; and though he staid a month in the city, during which time he gained over a few, yet at last the lower fort of people rose against him and obliged him to return to Mecca. This refufal, though it greatly discouraged the new converts, did not in the least abate the zeal of Mahomet: on the contrary, he continued to preach boldly to the public affemblies at the pilgrimage to Mecca, exclaiming against idolatry, and particularly against the worship of two idols Allat and Al Uzza, to which the tribes, especially the women of that of Thakif, were very much addicted. By this the prophet was often exposed to great danger: however, he gained fome converts, and amongst them fix of the inhabitants of Yathreb, of the Jewish tribe of Khazraj; who, on their return home. failed not to speak much in commendation of their new religion, and exhorted their fellow citizens immediately to embrace it. These converts of the tribe of Arabia. Khazraj are by the Arab writers called Al Anfar, Al Ansarii, or Ansars; that is, assistants, favourers, supporters, &c. because they affished and supported the Ansars, prophet when he was pursued to the very brink of destruction. They first met Mahomet on a little hill called Al Akabah, where a temple stood, and where they first took an oath to exert themselves in support of their new apostle and his religion. An uninterrupted friendthip and harmony reigned for a long time amongst the members of the Jewish tribes of Khazraj, Koreidha, and Nadir, whose great progenitor, say the Arabs, was Aaron the fun of Amran. Mahomet therefore infinuating himfelf into the good graces of the Anfars, they readily embraced his religion, and proved of very

confiderable fervice.

The next remarkable thing recorded of Mahomet is Mahomet's the invention of his night journey to heaven. This he journey to probably intended to supply the place of miracles. heaven The absurdities contained in that relation, however, are so great, that when he related it to his uncle Al Abbas, and Omm Hana the 'daughter of Abu Taleb, they endeavoured to diffuade him from making it publice. This advice he was fo far from following, that he related the whole to Abu Jahl, one of his most inveterate enemies, who ridiculed him for it, and placed the Rory in such a ridiculous light to the Koreish, that they were on the point of infulting him; feveral of his followers also left him; and the whole design had pro-almost bably been ruined, had not Abu Beer vouched for his proves the veracity, and declared, that, if Mahomet affirmed it to run of his be true, he firmly believed the whole. This declarabe true, he firmly believed the whole. This declaration not only retrieved the propher's credit, but increased it to such a degree, was sure of making his disciples swallow whatever the cased; and on this occasion it is said by some the sare Abu Beer the name of the faithful witself, as we have already related.

men and two women of Medina, who had professed

Mahometanism, besides several others who were yet un-

believers. On their arrival they fent immediately to

Mahomet, and offered him their affiftance, of which

he now stood in the greatest need; for his adversaries

were by this time grown so powerful in Mecca, that

he could not flay there much longer without imminent

danger. He therefore accepted their proposal, and

met them one night by appointment at the hill Al A-

kabah. At this interview he was attended by his uncle

In the twelfth year of Mahomet's mission, twelve men of Yathreb, or Medina, of whom ten were of the tribe of Kharai, and two of that of Aws, came to Mecca, and took an oath of fidelity to the prophet at the hill Alakabah. When they had folemnly engaged to do all required of them, Mahomet sent one of his disciples, named Masab Ebn Omair, home with them, to instruct them more fully in the grounds of their new religion. Masab being arrived at Medina, with the affiftance of the new profelytes, gained feveral others; and acquainting Mahomet with the success

of his mission, defired leave to form a congregation of Moslems at Medina. This the prophet readily grant-Congregaed; in consequence of which, the new Moslems regu-tion of Mc.larly affembled, to the number of forty persons, in the ed at Mahouse of Saad Ebn Khaithama. The next year Ma-dina. fab returned to Mecca, accompanied by feventy-three

Arabia. Al Abbas; who, though then an unbeliever, wished his hephew well, and made a speech to the people of Medina; wherein he told them, that as Mahomet was obliged to quit his native city and feek an afylum elfewhere, and as they had offered him their protection, they would do well not to deceive him; and if they were not firmly refolved to defend, and not to betray him, they had better declare their minds, and let him feek for protection somewhere else. Upon their protelling their fincerity, Mahomet swore to be faithful to them, a part of the Koran being read to all prefent, on condition they should protect him against all insults, as heartily as they would do their own wives and families. They then asked him what recompense they were to expect if they should happen to be killed in his quarrel: he answered, Paradise; upon which they pledged their faith to him, after Mahomet had chosen twelve out of their number, who were to have the fame authority under him that the twelve aposles had under Christ.

> Finding now a confederacy formed in his favour, our prophet began to pull off the mask as to his true sentiments concerning the means of reformation. Hitherto he had propagated his religion by fair means only; and in several passages of the Koran, which he pretended were revealed before this time, he declared, that his business was only to preach and admonish; that he had no authority to ce pel any person; and that whether they believed or not, was none of his concern, but belonged folely to God. But no fooner did he find himself enabled, by the alliance above mentioned, to refift his enemies, than he gave out that God had allowed him and his followers to defend themselves; and at length, as his far the increased, he pretended not only to have leave the inside defensive, but to attack the insidels, destroy ideatry, and set up the true religion by the power of the fword. To this he was excited by an apprehension that pacific measures would greatly retard, if not entirely overthrow, his defigns; and therefore he determined to use the most violent methods to convert the Pagan Arabs, or rather to extend his own authority.

he Koreput Maomet to cath.

The Koreish, in the mean time, finding that Mahoh resolve met had considerably extended his influence, and hearing of the league concluded with the Anfars, began to think it absolutely necessary that he should be prevented from escaping to Medina; and, in order to do this the more effectually, they refolved in a council, wherein it is faid the devil affisted in person, to put an end to his life. To accomplish this with the greater safety, they agreed that a man should be chosen out of every tribe, and that each should have a blow at him; that fo the guilt of his death might fall equally on all the tribes; and thus the Hashemites would be prevented from attempting to revenge the death of their kinfman, as they were much inferior in power to the rest of the tribes put together. Mahomet now directed his companions to repair to Medina, where, in consequence of the late treaty, they might be affured of protection. This they accordingly did: but he him elf, with Abu Beer and Ali, remained behind; not having received, as he pretended, the divine permission to retire. Here he narrowly watched the motions of the Koreish, and was foon apprized of their machinations: for the abovementioned conspiracy was scarce formed, when by some

means or other it came to Mahomet's knowledge; and Arabia. he gave out that it was revealed to him by the angel Gabriel, who also commanded him to retire from Mec-The conspirators were already assembled at the prophet's door; but he, to amuse them, ordered Ali to lie down in his place, and wrap himself in his green cloak: this Ali complied with, and Mahomet miracu-He outwits lously, according to the Arabs, escaped to the house them, and of Abu Becr. The conspirators, in the mean time, escapes. perceiving through a crevice Ali wrapped up in the green cloak, took him for Mahomet himself, and watched there till morning, when Ali arose, and they found themselves deceived. The prophet next retired in company with Abu Becr to a cave in Mount Thur, In great a hill a little fouth of Mecca. Here he had a still more darger at narrow escape; concerning which we have the follow-Mount ing account from an Arabic tradition. "The Koreish having detached a party from Mecca to reconnoitre the mouth of the cave, when they came there, found it covered by a spider's web, and a nest built at the entrance by two pigeons, which they faw, and which had laid two eggs therein. On fight of this they reasoned with themselves in the following manner: " If any person had lately entered dis cavern, " the eggs now before us would infallibly have been " broke, and the spider's web demolished; there can "therefore be nobody in it:" after which, they immediately retired. As the prophet, therefore, and his friend, were now faved to miraculously by means of the pigeon's eggs and the interpolition of the fpider's web, he afterwards enjoined his followers, in memory of fo remarkable an event, to look upon pigeons as a kind of facred animals, and never to kill a ipider."

The prophet and Abu Beer having staid in this cave He is purthree days in order to recover a little from their con-jued and sternation, fet out for Medina; but the Koreish, being but fill informed of the route they had taken, fent a party af-enapes. ter them, under the command of Soraka Ebn Malec. These overtook them; and, as the Arab historians tell us, Soraka's horse fell down when he attempted to feize Mahomet. Upon this he recommended himfelf to the prophet's prayers, and remounted his horse without hurt: but, as he still continued the pursuit, his horse fell down with him a fecond time; upon which he returned to Mecca, without offering any farther violence: and Mahomet, thus happily delivered from the greatest dangers, arrived without farther moleftation at Medina. where he was received with the greatest demonstrations of joy .- This flight of the prophet from Mecca to Medina was reckoned to remarkable by the Moslems, that they made it the era from whence all their remarkable transactions were dated, calling it the Era of the He-Era of the gira, o. flight. The beginning of the Hegira corre-Hegira.

fponded with the 16th of July, A. D. 622.

On Mahomet's arrival at Mecca, his first care was to build a mosque for his religious worship, and a house for himself. The city of Medina at that time was inhabited partly by Jews and partly by heretical Christians, that formed two factions which perfecuted one another with great violence. This gave the impostor such an opportunity of propagating his new religion, that in a fhort time the city was entirely at his devotion. Here he strengthened himself by marrying Ayesha the daughter of Abu Beer, though then only feven years of age, and gave his own daughter Fatima in marriage to Ali,

U a

Union of terin.

Arabia. the fon of Abu Taleb. The next point he had in view was the union of the Mohajerin, or those who fled from Mecca on account of their religion, with the Anfars the Anfars above mentioned. To facilitate this, after his mosque and Moha- and house were finished, he established among the Moslems a fraternity, the principal statute of which was, that they should not only treat one another like brethren, but likewife mod cordially love and mutually cherish one another to the utmost of their power. But, left, even this should prove insufficient, he coupled the individuals of the two bodies of Anfars and Mohajerin ; and this was the last transaction of the first year of the

> The next year was ushered in, according to Abulfeda, with a change of the Kebla, or place whither the Mahometans were to turn their faces in prayer. At first it had been declared to be perfectly indifferent where they turned their faces. Afterwards he directed them to pray with their faces towards the temple of Jerufalem, probably with a view to ingratiate himfelf with the Jews; and now, in order to gain the Pagan Arabs, he ordered his followers to pray with their faces towards the east. This inconstancy gave great offence, and occasioned the apostaly of many of his disciples. About this time Mahomet receiving advice that a rich caravan of the Koreish was on the road from Syria to Mecca, he detached his uncle Hamza, at the head of 30 horfe, to feize upon it; who accordingly lay in wait for it in one of the woods of Yamama, through which it was to pass: here, however, he was informed that the caravan was guarded by 300 men, so that he returned without making any attempt; but the prophet made the proper dispositions for acting hereafter against the Koreish with success. This year also Mahomet fent out a party of 60 or 80 horse, all Mohajerin, except one who was an Anfar, to make reprifals on the Korcish. They were met by a party of their enemies, and both fides immediately prepared for an engagement: however, they parted without bloodshed, except one of the Koreith, who was killed by an arrow

46 Mahomet takes a caravan, and gains the pattle of Bedr.

fhot by one of the Moslems. Mahomet, having now put himself into an offensive poslure, began in earnest to make reprisals on the Koreish. His first exploit was the taking of a caravan attended by a small guard; and this being accomplished by a party confilling only of nine men, contributed greatly to encourage the Moslems. But what most established the impostor's affairs, and was indeed the true foundation of all his future greatness, was his gaining the battle of Bedr; of which we have the following account.—The prophet being informed that Abu Sosian Ebn Harb escorted a cavavan of the Koreish with only 30 or 40 men, resolved to advance at the head of a small detachment of his troops to intercept it. To this he was excited by the riches of the caravan, which confifted of a large quantity of merchandife, confishing of the riches of Syria, carried on the backs of a thousand camels. He therefore fent out a arty to reconnoitre it, with orders to wait in some bovenient place, where they might remain undifcoered. But Abu Sofian having notice of Mahomet's thotions, despatched a courier to Mecca, requesting incours from his countrymen, that he might be able to efend the caravan. Upon this Mahomet drew together all his forces, which amounted to no more than

313, while his enemies confifted of very near 1000, Arabia. Abu Sofian having been reinforced by the Meccans with 050 men. The two armies did not long remain in a state of inaction: but before the battle three champions from each party engaged each other in fingle combat. In this the Moslem champions were victorious, and the event greatly discouraged the Koreish. Mahomet, in the mean time, taking advantage of this lucky event, offered up his prayers to God with great fervency and vehemence; after which, feigning himself in a trance, he pretended that God had assured him of victory. Then throwing an handful of dust or gravel towards the enemy, he cried out, "May the faces of them be confounded;" and attacked the Koreish with fuch bravery, that they were foon put to flight, leaving 70 dead on the spot, and having as many taken prisoners. The loss on Mahomet's side was only 14 men, and among the prisoners was Al Abbas the prophet's uncle.

Though this action may feem of little consequence in itself, it was of very great advantage to Mahomet's affairs at that time. He was immediately treated with the highest respect by the Najashi, or king of Ethiopia who received a particular account of the victory foon after it was gained; while the superstitious Moslems did not fail to look upon it as an evident declaration of heaven in their favour. Nay, notwithstanding the fmall number of enemies to be overcome, and who were only mortal men, these ignorant bigots did not hesitate to own the assistance of no less than 4000 angels, who, according to them, rode on black and white horses, having on their heads white and yellow fathes,

Notwithstanding this disaster their shoulders!

Notwithstanding this disaster their shoulders! Moslems, though they found great spoil on the field of battle; the division of which had likely to have proved fattle to their cause, by the quarrels that it occasioned among them. So hot, indeed, were the difputes on this occasion, that the impostor was obliged to pretend an immediate revelation from heaven, em-His law powering him to retain a fifth part for religious pur-concerning poses, and to distribute the rest equally. This became the division a law for his successors; but, with regard to himself, the of spoils. prophet often took the liberty of infringing it; for which, no doubt, a new revelation was always a ready and convenient falvo. As for those who were slain on Mahomet's part in this battle, they were all looked

mies, immediately caused their heads to be struck off. The Koreish, in order to be revenged on Mahomet for their late defeat at Bedr, fent Amru Ebn Al As, who afterwards conquered Egypt, with some other of their principal people, on an embaffy to the king of Ethiopia, in order to interest him in their quarrel. To do this the more effectually, they accused Mahomet and his followers of speaking disrespectfully of Jesus and his mother MARY; which accusation they hoped would likewise induce him to deliver up the Moslem refugees that were then at his court. But the bad fuccess that had attended the arms of the Koreish hitherto, joined to the excuses made by the refugees, not only hindered the Najashi from delivering them up.

Arabia. but also prompted him to dismiss the ambassadors, and return the presents they had brought him. In the mean time, Abu Sofian, who had fworn never to use perfumes or enjoy women till he had another battle with Mahomet, fet out from Mecca with a body of 200 horse. He advanced to a post within three miles of Medina; from whence he fent a detachment, who burnt a barn, together with a man in it that was winnowing wheat. Mahomet, being informed of this outrage, moved immediately towards him with a detachment of cavalry; but Abu Sofian was fo intimidated by his approach, that he fled with precipitation, leaving behind him all the facks of flour or meal that had been brought for the subsistence of his troops. Inflead therefore of coming to an engagement with the impostor, as he had sworn, he contented himself with alarming the country, and pillaging such as he suspected of favouring Mahometanism. - This year also Mahomet conquered the tribes called Banu Nolaim, Ghatfan, and the Banu Kainoka; plundering likewise a rich caravan belonging to the Koreish, and acquiring from thence 25,000 dirhems for his own share of the plunder.

In the year of Christ 625, being the third of the Thegira, the Koreish assembled an army of 3000 men, among whom were 200 horse and 700 armed with coats of mail. The command of this army was given to Abu Sofian, who was attended by his wife Henda Bint Otha, and fat down at a village about fix miles distant from Medina. Mahomet, being much inferior to the enemy, refolved at first to keep himself within the town, and receive them there; but afterwards, by the advice of his companions, marched out against them at the head of the according to some, 1050 according to others, or, to some say, only 900 men. Of these 200 were currenters; but he had only one horse besides his own in the whole army. He distributed three standards among his troops; of which one was given to the tribe of Aws, another to that of Khazraj, and the third to the Mohajerin. The grand standard was carried before the prophet by Mosaab Ebn Omair. With these forces Mationet formed a camp in a village near Ohod, a mountain about four miles north of Medina, which he contrived to have on his back; and the better to fecure his men from being furrounded, he placed 50 archers, the flower of his troops, in the rear, with strict orders not to quit their post. On the other hand, the army of the Koreish was drawn up in the form of a crescent, and made a very good appearance. The right wing was commanded by Khaled Ehn Al Walid, afterwards fo terrible to the Greeks; the left by Acrema Ebn Abu Jahl; and the centre by Abu Sofian. The corps de reserve was headed by Abu Sofian's wife, accompanied by 15 other matrons, who performed the office of drummers, lamenting the fate of their countrymen flain at Bedr, in order to animate the troops who attended them. The attack was begun by the Moslems, who fell upon the enemy with fuch fury, that their certre immediately began to give way. Ali, or, according to Abulfeda, Hamza, slew Arta the enemy's great standardbearer; which struck them with such terror, that they foon betook themselves to flight, falling foul upon their own corps de reserve. Victory had now been no longer doubtful, notwithstanding the vast inferiori-

ty of Mahomet's troops, had not the 50 archers, contrary to the prophet's express command, quitted their' post to pillage the enemy. Upon this Khaled, perceiving the Moslem army to be greatly exposed, attacked them in the rear with fuch bravery, that he turned the fortune of the day. Not content with putting the troops there in disorder, he cried out with all his might, "Mahomet is flain; and this had fuch an effect upon the Moslems, that they immediately took to their heels, nor could the utmost endeavours of the prophet himself afterwards rally them. He therefore Mahomet found himself obliged to quit the field of battle; in defeated. doing which he was very near losing his life, being struck down by a shower of stones and wounded in the face by two arrows, which occasioned the loss of two of his fore-teeth. He likewise received a contufion on his upper lip; and had even been killed on the spot, had not one of his companions, named Telba, Abu Beer's nephew, received a blow that was levelled at him. On this occasion Telha received a wound in his hand, which deprived him ever after of the use of some of his fingers. Of the Moslems 70 were slain; among whom were Hamza the prophet's uncle, and Mosaab the standard-bearer. Amongst the wounded were Abu Becr, Omar, and Othman; but as foon as they understood that the prophet was safe, they returned to the charge with a confiderable body, and, after an obstinate dispute, carried him off. The good retreat made by these champions so discouraged the troops of Abu Sofian, that they did not purfue the flying enemy, but contented themselves with remaining masters of the field of battle; nor did that general, though he exulted not a little in his victory, make any further use of it than to give Mahomet a challenge to meet him the next year at Bedr, which was accepted; and after his return to Mccca, he defired a truce with the Moslem; which was readily granted.

This defeat had like to have proved the total ruin of He apologi the impoltor's affairs, and must inevitably have done so zes for his had the conquerors made the least use of their victory, defeat Some of his followers now afferted, that had he been really a prophet fent from God, he could not have been thus defeated: and others were exasperated on account of the lofs of their friends and relations who had been sain in the late engagement. To still the murmurs of the former, he laid the blame on the fins of those who had accompanied him; and, to pacify the latter, he pretended a revelation from heaven, wherein the period of all men's lives was faid to be unalterably fixed without regard to their own actions, or to any external objects; fo that those who were killed in battle behoved to have died, though they had remained at home in their own houses. By the affistance of this last doctrine he encouraged his followers to fight, without fear, for the propagation of their faith, as all their caution would not be fufficient to avert their defliny, or prolong their lives even for a fingle moment.

The next year, (A. D. 626), Mahomet, besides several other less considerable successes, reduced a fortress belonging to the Jewish tribe of Al Nadir, who had revolted on account of the defeat at Ohod: on this occasion, by an express revelation, as he pretended, he kept the whole booty to himfelf: and, about the fame time, forbade his followers the use of wine, or to play at games of chance, on account of the disturbances and quarrela

Battle of Phod.

Siege of

Medina,

Arabia. quarrels which were likely to be excited by that means among them. This year also he marched with a body of infantry to Bedr, to meet Abu Sofian, as he had promifed the year before: but that general's heart failing him, he returned home without facing the prophet; and this piece of cowardice the Moslems did not fail to impute to a terror fent immediately from God. The year following, however, the Koreish, in conjunction with the tribe of Ghatfan, and the Jews of Al Nadir and Koreidha, affembled an army of 12,000 men, with which they formed the fiege of Medina; thus threatening the impostor and all his followers with utter deftruction at once. On the enemy's approach, Mahomet, by the advice of a Persian named Salman, ordered a deep ditch to be dug round the city, and went out to defend it with 3000 men. The Arabs having invested the town, both sides remained in a state of inactivity for fome time; which was so well employed by the impostor, that he found means to corrupt some of the leading men in the enemy's camp. The good effects of this foon appeared; for a champion having advanced to the Moslem intrenchments, and challenged the best man in their army to fight him in fingle combat, the challenge was immediately accepted by Ali, who flew him and another that came to his affiltance; after which, those who had been corrupted by Mahomet's agents fo foured a confiderable part of the forces, that they deferted their camp; upon which all the rest were

obliged to raife the fiege and return home.

The fiege raifed.

hites maffa-

The prophet, being now happily delivered from the most powerful combination that had ever been formed against him, was visited by the angel Gabriel; who asked him, whether he had suffered his men to lay down their arms, when the angels had not laid down theirs? ordering him at the same time to go immediately against the tribe of Koreidha, and affuring him that he himfelf would lead the way. Upon this Mahomet immediately fet out for the fortress of the Koreidhites, and pushed on the fiege with fo much vigour, that, though it was deemed impregnable, he obliged the garrison to capitulate in twenty-five days. The Koreidhites, not daring to trust themselves to the impostor's mercy, surrendered at discretion to Saad Ebn Moadh, prince of the tribe of Aws, hoping that he, being one of their old friends and confederates, would have fome regard for them. Here, however, they found themselves disappointed; for Saad, being highly provoked at them for affishing the Koreish while in league with Mahomet, ordered the men to be put to the fword, the women and children made flaves, and their goods divided a-This fentence was no fooner mong the Moslems. heard by Mahomet, than he cried out that Saad had pronounced the fentence of God; and, in confequence of this decision, ordered the men, to the number of 600 or 700, to be immediately massacred. The women and children were also carried into captivity. Their immoveable possessions were given to the Mohajerin, and the goods divided equally.

Mahomet now continued to be successful, gradually reducing the Arab tribes one after another. In 628, he sent an agent to Constantinople, desiring leave of the Greek emperor to trade with his subjects; which was immediately granted. The same year also he concluda peace for ten years with the inhabitants of Mecca, and obtained liberty the next year to perform his devotions at the Caaba. What tended confiderably to bring Arabia. about this pacification was an account brought to the Koreish by one whom they had fent with an actual de-france to Mahomet, of the prodigious veneration which veneration his followers had for him. This messenger acquainted for Mahothem that he had been at the courts both of the Ro- met. man emperors and of the kings of Persia, but never faw any prince fo highly respected as Mahomet was by his companions. Whenever he made the ablution, in order to fay his prayers, they ran and caught the water which he had used; whenever he spit, they licked it up, and gathered up every hair that fell from him, with great veneration. This inturated how desperately they would fight in his defence, and probably inclined his enemies to avoid hostilities. In 629, the He invites impostor began to think of propagating his religion be-foreign yond the bounds of Arabia, and fent meffengers to fe princes to veral neighbouring princes to invite them to embrace religion. Mahometanism; but, before fending the letters, he caused a filver seal to be made, on which were engraved in three lines the following words, " MAHOMET THE APOSTLE OF GOD." This feal, he believed, would procure the letters to which it was affixed a more favourable reception at the courts of those princes whither they were directed. The first to whom he applied was Khofiu Parvis the king of Persia; but he, finding that Mahomet had put his own name before his, tore the letter in pieces, and fent away the messenger very abruptly. He also sent a letter to the same purpose to Constantinople; but though the emperor Heraclius dismisfed his messengers honourably, he resuled to abandon the Christian faith. Besides these, he wrote five other letters, which hedistributed among those who he thought would be most likely to acknowledge him for an apostle. However, we do not hear that by means of letters he ever introduced his religion into a foreign country.-But while our impostor was thus going on in the full ca-Is poiloned, reer of fuccels, and industriously propagating his infa-but recomous falschoods by all the means he could think of, he vers was poisoned by a maid, who wanted, as she said, to make an experiment whether he was a prophet or not. This was done by communicating fome poifon to a shoulder of mutton, of which one of his companions, named Bashar Ebn Al Bara, eating heartily, died upon the spot; and Mahomet himself, though he recovered a little, and lived three years after, yet never enjoyed perfect health. Notwithstanding this misfortune, however, he still continued his enterprises. The year 630 proved remarkably fortunate. It was ushered in by the conversion of Khaled Ebn Al Walid, Amru Ebn Al As, and Othman Ebn Telha, three of the most confiderable persons among the Koreish; and this soon enabled him to become master of the whole peninsula of Arabia. This year also the inhabitants of Mecca Meccans took it into their heads to violate the treaty concluded violate the with Mahomet: for the tribe of Becr, who were the treaty with confederates of the Koreish, attacking those of Kho-Mahomet. zaab, who were in alliance with Mahomet, massacred 20 of them, and afterwards retired; being supported in this action by a party of the Koreish themselves .-The confequence of this violation was foon apprehended; and Abu Sofian himself made a journey to Medina, in order to heal the breach and renew the truce: but in vain; for Mahomet, glad of this opportunity, refused to see him. Upon this he applied to Abu Beer, Ali,

Arabia. Omar, and Fatima, to intercede for their countrymen with the prophet; but some of these giving him rough answers, and others none at all, he was obliged to return to Mecca as he came. Mahomet immediately gave orders for the necessary preparations, that he might furprise the Meccans, who were by no means in a condition to receive him; but Hateb Ebn Abu Baltaa, hitherto a faithful Moslem, attempted to give them notice of their danger by a letter; though without effect. His letter was intercepted: and he alleged in his excuse, that the only reason he had for his conduct was to induce the Koreish to treat his family with kindness. This excuse the prophet accepted, as he had greatly distinguished himself at the battle of Bedr, but strictly forbade any fuch practices for the future; which having done, he immediately made the necessary dispositions for fetting forward.

Mahomet's army, on this occasion, was composed of Mohajerin, Ansars, and other Arabs, who had lately become profelytes. As they drew near to Mecca, he fet up his standards, and advanced in order of battle to Mar Al Dharan, a place about four parasangs from Mecca, where the whole army encamped. Here he ordered 10,000 fires to be lighted, and committed the defence of the camp to Omar, who cut off all communication with the town, so that the Meccans could receive no certain advice of their approach. Among others that came from Mecca to reconnoitre the Moflem camp, Abu Sofian Ebn Harb, Hakim Ebn Hezam, and Bodail Ebn Warka, fell into Omar's hands; and being conducted to Mahomet, were obliged to embrace Mahometanism in order to save their lives.

The first rumour of this expedition had not a little terrified the Koreish, though they were not apprized that the prophet had refolved upon a war; but perceiving now, upon the report of Abu Sofian, who had been fent back to them, that the enemy was at their gates, they were thrown into the utmost consternation. Of this Mahomet being informed, he refolved to take advantage of the confusion that then reigned among them. He therefore first despatched Hakem and Bodail to the Meccans, inviting them to take an oath of allegiance to him, and become converts to his new religion; after which, he made the following disposition of his forces. Al Zobier was ordered to advance with a detachment towards the town on the fide of Mount Cada. Saad Ebn Obad, prince of the tribe Khazraj, marched by his order with another detachment towards the height of Coda, which commands the plain of Mecca. Ali commanded the left wing of the army, confilling of Aufars and Mohajerin. The prophet put into his hands the great standard of Mahometanism, with orders to post himself upon Mount Al Hajun, and to plant the flandard there; strictly enjoining him, however, iot to thir from thence till he himself arrived, and till a proper fignal should be given him from Saad for that purpose. Khaled led the right wing, confishing of the Arabs lately converted, with which he was to possels himself of the plain of Mecca. Abu Obeidah commanded in the centre, which confifted entirely of infantry; the prophet himself remained in the rear, from whence he could most easily despatch his orders to all the generals as occasion should require. He expressly prohibited Khaled and all his other officers from acting offenfively unless they were first attacked. Things being

in this fituation, the army upon a fignal given put it- Arabia. felf immediately in motion. The prophet mounted his camel with great alacrity, and was that day clothed in red. Al Zobeir purfued the route affigned him without opposition; nor did Saad discover the faintest traces of an enemy: Ali took possession of his post without the loss of a man; and in like manner Abu Obeidah feized on the fuburbs. Khaled, however, in his march to the plain, was met by a large body of the Koreish and their confederates, whom he immediately attacked and defeated, putting 28 of them to the fword. Not content with this, he pursued them into the town, and Mecca tamassacred a great number of the inhabitants; which soken. terrified the reft, that some shut themselves up in their houses, while others fled different ways in order to avoid the fury of the merciless and impious tyrant, who was now become master of the city. Thus was Mecca reduced, with the lofs only of two men on the fide of the impostor.

Mahomet being now master of the city, made his public entry into it exactly at fun rifing. When the first tumult was over, he went in procession round the Caaba feven times, touching the corner of the black flone with the staff in his hand, as often as he passed it, with great devotion. Then he entered the Caaba; where observing several idols in the form of angels, and the statues of Abraham and Ishmael with the arrows of divination in their hands, he caused them all to be destroyed. He also broke in pieces with his own hands a wooden pigeon, that had long been effected a deity by the idolatrous Koreish. Afterwards entering into the interior part of the Caaba, he repeated with a loud voice the form used at this day by the Mahometans, "Allah Akbar, God is great," &c. turning towards every part of the temple. Then he prayed between the two pillars there, with two inclinations, as well as without the Caaba; faying to those that attended him, "This is your Kebla, or the place towards which you are to turn your faces in prayer."

Having thus effectually subdued the Korcish, put an end to all commotions, and purged the Caaba of 360 idols, the prophet's next care was to ingratiate himself with the people. Sending therefore for some of the principal of them, he asked them what kind of treatment they expected from him, now he had conquered them? To this they replied, " None but what is favourable, O generous brother:" upon which he difinisfed them, telling them they were from that moment a free people. After this, pretending a new 1cvelation, he restored the keys of the Caaba, to Othman Ebn Telha, who was in possession of them before; and who was now so much affected by this piece of justice, that he immediately became a profelyte. Next day the prophet declared Mecca an afylum, and publicly gave out that he would maintain to the utmost of his power the inviolable fecurity of the place. He then was folemnly inaugurated; after which he proferibed, according to fome, fix men and four women according to others, eleven men and one woman : but of these only three men and one woman were put to death; the rest being pardoned on their embracing Mahometanism, and one woman making her escape. The remainder of this year was spent in various expeditions against different tribes of the Arabs, which were in general attended with fuccefs.

Arabia.

The ninth year of the Hegira, being that of Christ 631, is called by the Mahomentans the year of Embaffies; for the Arabs, who had hitherto been expecting the issue of the war between Mahomet and the Koreish, no fooner faw that which was the most considerable of the whole fubmit to him, than they began to come in to him in great numbers, and to fend embassies to make their fubmissions to him, both while at Mecca and after his return to Medina, whither he had returned foon after the taking of Mecca: and thus good fortune continued without interruption to the year 632, when this famous impostor breathed his last, having just reduced under his subjection the whole peninsula of Arabia, and being ready to break into the neighbouring kingdoms in order to fatisfy his ambition.

dics.

.6ı Great condeath.

The death of Mahomet occasioned such a consternafusion on his tion in Mecca, that the governor hid himself, fearing to be called to an account for his former conduct; and the inhabitants, upon the first arrival of this melancholy news, confidered themselves as destitute of all manner of protection. After the first impressions of their fear. however, were over, they began to meditate a revolt : but were prevented by one Sohail Ebn Amru, a principal man of the Koreith. The tumults at Medina, however, were not so easily appealed. The news of this fad event was no fooner published there, than a number of people affembled before his door, crying out, " How can our apostle be dead ? Our intercessor, our mediator, has not entirely left us! He is taken up into heaven, as was Ifa (Jefus); therefore he shall not beburied." This was confirmed by Omar; who drew his fword, and fwore, that if any person assirmed Mahomet to be dead, he would cut off his hands and his feet. "The apofile of God (fays he) is not dead : he is only gone for a feafon, as Moses the fon of Amram was gone from the people of Israel for forty days, and then returned to them again." The populace therefore kept the body above ground, even after the belly began to swell; nor could the prophet's uncle Al Abbas, notwithstanding this, convince them to the contrary. Upon hearing of these transactions, Abu Beer immediately posted from Al Sonah, another quarter of the city, and expostulated with them in the following manner: "Do you worship Mahomet, or the god of Mahomet? If the latter, he is immortal, and liveth for ever; but if the former, you are in a manifest error, for he is certainly dead." The truth of this affertion he immediately evinced from feveral passages of the Koran, in so clear and conclusive a manner, that he not only satisfied Omar, but calmed the minds of all the people.

The prophet having left no directions concerning a fuccesfor, very warm disputes arose between the Mahojerin and the Anfars about the right of electing a caliph. The former infifted on having that right, because they had attended Mahomet in his flight to Medina; and the others, because they had supported him when expelled from his native city, &c. In short, the difputes became so hot, that an open rupture must have commenced, had not they been terminated by a propofal that each party should choose a caliph. This amused them a little for the prefent; but not proving perfectly agreeable to the Mohajerin, Abu Becr proposed two persons, Omar and Abu Obeidah, offering to swear allegiance to him on whom the fuffrages of both parties should fall. But this producing no decision, Omar fwore fealty to Abu Beer, and his example was follow- Arabia. ed by all the Moslems on the spot; upon which he was acknowledged both by the Mohajerin and Anfars as 62
Abu Becr the rightful successor of Mahomet. facceeds

These transactions, however, were not at all agree-him. able to Ali, who, as fon-in-law to the prophet, had undoubtedly the best title to the succession. He expo- Ali distrib. stulated with Abu Beer about the manner of his elec-fied. tion, which had been effected without his knowledge: and received for answer, that the exigence of affairs would not admit of deliberation; and that, had not the election been so sudden, the opposite party would have wrested the power entirely out of their hands. Ali was in Fatima's apartment when Abu Beer had the good luck to be elected caliph; and, upon the arrival of the news, expressed great distatisfaction. He found himfelf, however, foon obliged to change his note, when the new caliph fent Omar with orders to burn the house where he and his friends were affembled, in case he did not concur in supporting the election. But notwithstanding his forced compliance on this occasion, it is not to be doubted that he reckoned himself injured; and his pretentions were thought to be just by a great number of Moslems: which notion is entertained by a very confiderable party of Mahometans even at this day;

and these are called Shiites or fettarics.

Soon after Abu Becr's accession, many of the Arabs refused to pay the tribute imposed upon them by Mahomet, and even attempted to shake off his yoke altogether. This fo alarmed the caliph and his subjects at Medina, that, fearing a general revolt, they fent all not able to bear arms into the cavities of the rocks and mountains, and put themselves in as good a posture of defence as the short time would permit. In the mean time Khaled was despatched with an army of 4500 men Rebellions to reduce the rebels; and he foon coming up with them, extinguishgave them a total defeat, brought off a vaft quantity of ed by Khaplunder, and made many of their children slaves. Nor led. was he content with this; for being fent by Abu Becr to Malec Ebn Noweirah, an eminent person among the Arabs, and famous for his skill in poetry as well as his horsemanship and bravery, to bring him over by fair means, he immediately ordered his head to be cut off. By this means, indeed, he extinguished all the remains of rebellion; but rendered himself exceedingly obnoxious to Abu Beer, who would have put him to death, had not Omar strongly interceded for him: for Khaled had greatly exceeded his commission, as Malek had returned to Mahometanism, and had offered to pay the money. This was not, however, the only piece of fervice Khaled performed at this time; he also defeated and killed Moseilama, who had set up for a prophet in the time of Mahomet, and even wanted to take the grand impostor himself into company with him. The same general likewise deseated and dispersed the troops of another prophet, called Toleiah Ebn Khowailed, obliging himself to remain concealed till after the death of Abu Becr. About the same time another body of rebels committed great disorders in the province of Bahrein. Against these Abu Beer despatched Al Ola at the head of a confiderable army, who foon obliged them to return to Mahometanism; having put great numbers of them to the fword, and plundered their country in a

dreadful manner. Abu Beer having now no enemy to contend with in War with Arabia, the Greeks.

Arabia. Arabia, and being free from all apprehensions of a competitor, refolved next to turn his armsagainst the Greek emperor. Some skirmishes had happened, in the time of Malromet, between the Moslems and Greeks; in one of which Zeid, a Moslem commander, had been killed. To revenge his death, his fon Ofama was on the point of making an irruption into Syria at the time of Mahomet's deceafe. This enterprise the caliph ordered him to go on with; and it was executed by Ofama with great success. He entered Syria, and laid waste the country, doing the Greeks a good deal of damage; after which he returned to Arabia without any confiderable lofs.

66 Kingdom of thra deftroyed.

Soon after the caliph fent Khaled at the head of a powerful army to invade Irak, and put an end to the kingdom of Hira. In this undertaking he was attended with his usual success. The king Al Mondar Al Maghrur loft his life in defence of his dominions; and the kingdom was totally destroyed, after it had continucd 622 years and eight months, as we have already hinted. The inhabitants became tributaries; and, according to Eutychius, the tribute collected on this occasion amounted to 70,000 pieces of money. This, according to Al Makin, was the first tribute money

ever brought to Medina.

The exigence of the caliph's affairs in Syria, however, did not fuffer Khaled long to remain in Irak. Before the departure of the army under his command, Abu Beer had come to a refolution to invade Syria; and finding his defign approved by the principal officers of his court, he fent circular letters to the petty princes of Yaman, the chief men of Mecca, &c. informing them of his intention to take Syria out of the hands of the infidels.) mounting them, at the same time, that a war for the propagation of the true religion was an act of obedience to God. To these letters they paid a proper regard; and in a very short time appeared at Medina at the head of their respective troops, and pitched their tents round the city. Here they staid till the Moslem army destined to act against the emperor was completely formed, and in a capacity to begin its march. The caliph having viewed the troops from the top of an hill, and prayed to God for fuccess, attended the generals a little way on foot. As the generals were on horseback, they could not forbear expressing their uneafiness at the caliph's thus demeaning himfelf; but he told them, that it fignified little whether they walked on foot or rode, as they had all Abu Beer's the same views, viz. the service of God, and the propagation of religion. At parting, he addressed Yezid Ebn Abu Sofian, whom he had invested with the fupreme command, in the following manner: "Take care, Yezid Ebn Abu Sofian, to treat your men with tenderness and lenity. Consult with your officers on all pressing occasions, and encourage them to face the enemy with bravery and resolution. If you shall happen to be victorious, destroy neither old people, women, nor children. Cut down no palm trees, nor burn any fields of corn. Spare all fruit trees, and flay no cattle but fuch as you shall take for your own use. Adhere always inviolably to your engagements, and put none of the religious persons you shall meet with in monasteries to the sword. Offer no violence to the places they ferve God in. As for those members of the fynagogues of Satan who shave their crowns, cleave Vol. II. Part I.

their skulls, and give them no quarter, except they em- Arabia. brace Islamism (Mahometanism), or pay tribute."

The Greek emperor was greatly alarmed at the approach of the Moslem army; however, he made all neceffary preparations for his defence, and fent out a detachment to reconnoitre the enemy. These having fallen in with the Arabs, a battle enfued, in which the Greeks were defeated with the loss of 1200, while the Arabs loft only 120 men. This was succeeded by a great many skirmishes, in which the Moslems were generally victorious. The rich spoil taken on these occasions was fent as a prefent to the caliph; who having acquainted the inhabitants of Mecca with his good fuccess, they were thereby so elated, that they furnished him with a ftrong reinforcement, which was immediately ordered into Syria. The Greek emperor, in the mean time, having ordered another body of his troops to advance towards the frontiers, they found an opportunity of engaging the Moslem army under Abu Obeidah, a person of great piety, but little experience in The Moswar. Him they totally defeated; and Abu Beer was lems deso much provoked at his defeat, that he deprived him feated. of the command, which was given to Khaled, who was for this purpole recalled from Irak. That general's first exploit was the reduction of Bostra, a very rich and populous city of Syria Damascena; which, however, he accomplished by treachery rather than by force of arms. Having left a garrifon of 400 men in Bostra, and being joined by Abu Obeidah's forces, he laid fiege to Damascus with an army of 45,000 men. This so a-Damascus larmed the emperor, that he defpatched an army of befieged 100,000 men, commanded by one Werdan to the relief of that city. Khaled, on hearing of the approach of this formidable army, was for marching immediately with all his forces, and giving them battle; but this was opposed by Abu Obeidah, as it would enable the inhabitants of Damaseus to procure fresh supplies both of arms and provisions, and confequently render the reduction of the place more difficult. It was, therefore, at last agreed, that a body of troops should be detached under Derar Ebn Al Wazar, an excellent officer, and an implacable enemy to the Christians (as indeed were all the Moslem generals except Abu Oheidah), to fight the enemy, whilst the siege was carried on by the two generals.

Khaled, fearing left Derar's furious zeal and hatred The Greek to the Christians should prove fatal to his troops, told defeated him before his departure, that though they were com- with great manded to fight for the propagation of their religion, yet they were not allowed to throw away the lives of their men; and therefore ordered him to retire to the main body of the army, in case he found himself pressed . by a superior force. But Derar, deaf to this falutary admonition, with his small body of troops rushed upon the whole Christian army, notwithstanding the vast disproportion of numbers. He charged them, however, with fuch bravery, that he penetrated to the spot where the general gave his orders, killed the standard-bearer, and carried off the standard itself, in which was a cross richly adorned with precious flones. Nay, he would in all probability have put Werdan's army to flight, had not that general's fon, the commandant of Hems. arrived in the heat of the engagement with a body of 10,000 men; with which he attacked the Moslems fo briskly in the rear, that he forced them to retire, and

taken.

Arabia, took Derar himfelf prifoner. This fo discouraged them, that they would have taken to their heels, had not Rafi Ehn Omeirali animated them with the following words. "What! do not you know, that whoever turns his back upon his enemies offends God and his prophet? and that the prophet declared the gates of paradife should be open to none but such as fought for religion? Come on! I will go before you. If your captain be dead, or taken prisoner, yet your God is alive, and fees what you do." This exhortation had fuch an effect upon his troops, that returning to the charge, they maintained their ground with unparalleled bravery, till Khaled arrived with a confiderable body of infantry and 1000 horse. The arrival of this general foon turned the fortune of the day. A party of the imperial army went over to the Moslems, and the rest took to their heels. Derar also was retaken, and carried off in triumph. However, Werdan, having collected the shattered remains of his forces, and received a reinforcement from the emperor, found his army still to amount to 70,000 men, with which he resolved to make another attempt for the relief of Damascus. They were attended with full worse success in this second attempt than they had been before; being utterly defeated, with the loss of 50,000 men, so that they were no more in a condition to attempt any thing; and, in consequence of this, the city was soon taken, notwithstanding the utmost efforts of the belieged.

This disastrous event happened in the year 634; and dies, and is the very day that Damascus was taken, Abu Beer died of a confumption in the 63d year of his age. He was facceeded by Omar, who was proclaimed caliph that very day; and the first title affigned him was, The caliph of the caliph of the apollle of God. But the Arabs confidering, that by the additions to be continually made at the accession of every new caliph, the title would become too long, they with one voice faluted him, Emperor of the lelievers; which illustrious title defeended aftewards to his fuccessors by a kind of in-

contestable right.

The new caliph was no fooner fettled than he replaced Abu Obeidah in the command of the army in Syrin, being greatly displeased with the cruel and bloodthirfly disposition of Khaled. He also commanded Abu Obeidah to have an eye upon Paleftine, and to invade it as foon as an opportunity offered. Khaled bore his diffrace with great magnanimity; and fwore, that though he had always had the greatest regard for Abu Beer, and the utmost aversion to Omar, he would submit to God's will, and obey the new caliph as the lawful fuccessor of Mahomet. The Moslem forces in the ... ancan time having made all proper dispositions for improding the advantages they had gained, Abu Obeidah fent a detachment of 500 horse to a place called Dair Abel Kodos, about 30 miles from Damascus, to plunder the Christians there. In this place there lived a priest so eminent for his sanctity, that the neighbouring people of all ranks reforted to him for his bleffing and instruction, When any person of distinction martied, he took with him his new spouse, in order to remeive this holy man's benediction. The fame of this prieft's fanctity drew fuch numbers of people to that place every Easter, that a great fair was kept annually at his house to which were brought vast quantities of the richest filks, plate, jewels, &c. When the Arabs

drew near to this place, to which they were conducted Arabia. by a Christian, they were informed that the governor of Tripoli had married his daughter to a person of diflinction, who had carried his lady to the above mentioned priest. She was attended by a guard of 5000 men; besides which, the Jews, Greeks, Copts, and Armenians, at that time affembled about the monaflery, amounted to 10,000. Notwithstanding this, the Moslem commander determined to carry off the lady; Governor and having told his men, that they should either enjoy of Tripoli's the riches of the Christians, or the pleasures of para-daughter dife, he commanded them to fall on the enemy. The carried off. impetuofity of these enthusiaits at first bore all down before them; but the Christians, perceiving they were but an handful of men, furrounded them on all fides, and resolved to make them pay dear for their temerity. But Abu Obeidah, being informed of their dangerous fituation, immediately despatched Khaled with a strong detachment to the relief of his distressed countrymen. The consequence of this was, that the Christians were entirely defeated, and the unhappy lady carried off, with 40 maids that waited upon her, as well as all the wealth brought to the above mentioned fair; among which were many rich garments curioully wrought, and in particular one adorned with the effigies of our Saviour. All these were fold for ten times their weight of gold to some of the opulent Arabs of Yaman. The young lady was given to Abdallah, who kept her to the reign of Yezid. Of this advantage Abu Obeidah fent notice to the caliph by a letter, in which he also acquainted him that some of his men had drumber unishmen These delinquents, by the advice of Ali, had of some each of them for tripes bestowed upon the foles of foldiers their feet : after which, many others, who had never who had been suspected of drieking this prohibited liquot, made a voluntary confession, and received the same charges

The Moslem general next set about reducing the principal fortreffes in Syria, and foon became matter of Kinnifrin, Baalbec, Adeftan, Shaizar, and Hems; on the news of which, the Greek emperor Heraclius, refolving if possible to put a stop to the cruel and unprovoked ravages of these barbarians, sent against them an army of 240,000 men, commanded by one Manuel, 75 whom the Arabs call Mahan. But this vast multitude The Greeks was utterly defeated by Khaled; upon whom Abu O-feated at beidah conferred the supreme command, on account of Yermouk. his fuperior skill in military affairs. This battle was fought near a village called Yermouk; and, according to the Arabian historians, the Christians had 150,000 men killed and 40,000 taken prisoners, while the Moflems loft no more than 4030 men.

The defeat of Yermouk was immediately followed by the loss of the whole province of Palestine. The Omar visits reduction of Jerusalem was one of its first consequences; Jerusalem and Omar, being apprifed of the success of his arms, immediately fet out to visit that holy place, at the request, it is said, of the inhabitants. The caliph was attended in his journey by a numerous retinue, most of whom afterwards returned home. He rode upon a red camel, and carried with him two facks, one of which contained a fort of provision consisting of barley, rice, or wheat, fodden and unhusked, and the other fruits. Before him he had a leather bottle, very necessary in these defert countries to put water in; and behind him

Anccdote

f him.

Arabia a wooden platter. Before he left the place where he had refled the preceding night, he constantly faid the morning prayer; after which he addressed himself to his attendants in a devout strain, always uttering before them fome pious ejaculations. Then he communicated his provision to them; every one of his fellow travellers eating with him out of the fame platter, without the least distinction. His clothes were made of camels hair, and were in a very tattered condition; nor could any thing be more mean or fordid than the figure he made. On the road he distributed justice among his subjects; concerning which we have several anecdotes; but that most to his honour is the following: Having observed some poor tributaries exposed to the heat of the fun, a very cruel punishment in those hot countries, for not being able to pay the fum demanded of them, he ordered them to be released; telling his attendants, that he once heard the apostle of God say, "Do not afflict men in this world; for those who do so, Ged shall punish in hell fire at the day of judgement." His orders were immediately executed, to the great grief of the oppressors; and the caliph continued his route. On the confines of Syria he was met by Abu Obeidah attended by an efcort, who conducted him to the Moslem camp, where he was received with the utmost demonstrations of joy; and from thence to Jerusalem. The morning after his arrival, he said prayers and preached to the troops. In his fermon he repeated the following passage out of the Koran. "Whomsoever God shall direct, he shall be rightly directed; and whomfoever he shall cause to err, thou shalt a not find any to defend or to direct." Upon this a Christian rose up, and faid aloud twice, " God causes so one to de. Omer made no aufwer to him, but commanded the Moslems bear him tostrike off the infidel's he repeated those words again; but the priest the conclusion of his fermon, he pitched his tent, made of hair, within fight of the city: then he figned the articles of control to by which the inhabitants were

> fession of their properties, and his protection. The articles of capitulation being figned, Omar, in pursuance of his engagements, gave the inhabitants a schedule, by which they were secured in the full possession of all that had been agreed upon: after which the gates were opened to him, and he entered the town. He was waited upon by the patriarch Sophronius, with whom he converfed familiarly, and asked him many questions concerning the antiquities of the city. One of the first places they visited was the temple of the refurrection, in the midit of which Omar fat down; and when the hour of prayer was come, told the patriarch he had a mind to pray, and defired him to show him a place for that purpose. Sophronius told him he might do so where he was; but this he absolutely refused. Then the patriarch led him to St Constantine's church; but he likewise declined praying there. At last he faid his prayers upon one of the steps of the east gate of the church; telling the patriarch afterwards, that had he prayed in any of the churches, the Moflems would infallibly have taken it from them, which, he said, they might attempt as it was, and therefore gave him a paper, wherein the Moslen's were commanded not to pray on the steps of St Constantine's

> entitled to the free exercise of their religion, the pos-

church in any numbers, but only one by one. After Ardia this he defired the patriarch to show him a place where he might erect a mosque; and was conducted to the place where Jacob's stone lay, on which he slept when he faw the vition of the ladder. This stone had been hitherto flighted, and no building fuffered to be erecked upon it, in order to fulfil our Saviour's prophecy, that the habitation of the Jews should be left unto them desolate, and that not one stone should be left upon another, In consequence of this neglect it was entirely covered with dirt, which the caliph immediately began to carry away in his vest; and the Moslems foon haltening to affirt him, the flone was cleared in a very short time. We are told by Theophanes, that when Omar entered the temple of the refurrection, he was clad in such mean and dirty apparel, that the patriarch took great offence at his appearance, and with much difficulty at last prevailed upon him to put on fome clean linen and clothes till his own could be wash-The fame author relates, that when the patriaich first saw Omar in that place, he could not forbear crying out, "This is of a truth the abomination of defolation, spoken of by Daniel the prophet, standing in the holy place!" These words, as Mr Ockley imagines, being overheard by the Moslems, they trumped up a story of the patriarch's having owned that me conquest of Jerusalem by Omar was foretold by the prophet Daniel; and that an ancient prophecy was kept in Jerusalem concerning Omar, wherein his perfon was deferibed, his name and religion specified, and he declared to be the only man that could reduce that city.

Before the caliph left Syria, he divided that country into two parts; one of which, that lay between Hauran or Aûran and Aleppo, which was not perfectly conquered, he committed to the care of Abu Obeidah, giving him the strictest orders to reduce it as foon as possible. Yezid Ebu Abu Sofian was commanded to take upon him the care of the other, which comprehended Paleflive, and the fea coast, and to make hinsfelf absolute mafter of it, having a body of troops affigued him to. that purpose. He also directed Amru Ebn Al As to invade Egypt, then in a very languishing condition, with a body of Moslem forces. After having made these dispositions for extending his conquests, Omar fet out for Medina, where he arrived in perfect health, He seterna to the great joy of the inhabitants, who apprehended, to Veduce. from his long stay at Jerusalem, that he had intended to fix his residence there.

Soon after Omar's departure, Yezid advanced to Cafarea; but found the place fo strong that he was obliged to continue some time in a state of maction. Abu Obeidah, in the mean time, advanced towards Aleppo, the citadel of which was at that time the strongest in Syria. The citizens were struck with the utmost consternation at his approach. They had at that time two governors, who were brothers, and refided in the caftle, which was fituated at a little distance from the city. The names of these two governors, who were of very different dispositions, were Youkinna and John. Their father, by the emperor Heraclius's appointment, prefided over all that tract which lay betwixt Aleppo and the Euphrates; and, after his death, the chief management of affairs devolved upon Youkinna, his brother John spending his time mostly in devotion and acts of

X 2

charity.

Arabia charity. He would therefore gladly have prevailed on Youkinna to purchase a peace from the Arabs with money, rather than make his country a scene of blood and ravages; but this not fuiting the martial genius of Youkinna, he armed a confiderable number of the citizens, among whom were feveral Christian Arabs, and diffributed money among them. He then told his men that he intended to act offensively against the Arabs, and even to engage them if possible before they drew too near. To inspire them with the greater resolution, he observed, that the Moslem army was divided into feveral hodies; one of which had orders to befiege Cæfarea, another to march to Damaseus, and the third to invade Egypt. Having thus animated his troops, he put himself at the head of 12,000 of them, and marched forwards to get intelligence of the enemy's motions. A Moslem Abu Obeidah, in the mean time, had fent before him detachment Caab Ebn Damarah, with 1000 men; giving him exdefeated by prefs orders not to fight till he had received information

of the enemy. Youkinna's spies discovered Caab and his men refting themselves and watering their horses without the leaft apprehension of danger; of which the general being apprifed, he posted one part of his troops in ambuscade, and with the other attacked the Moslems. The Arabs behaved with their usual valour; and at first repulsed the Christians, notwithstanding their fuperiority in numbers; but being attacked by the troops that lay in ambush, they were at last forced to retire; having 170 killed, and almost all the rest

wounded.

80 Aleppo fub-Obcidah.

After Youkinna's departure, the inhabitants of Amits to Abu leppo, confidering the calamities that awaited them if their city should be taken by storm, submitted without delay to Abu Oheidah, and were taken under the protection of the caliph. This difagreeable news being communicated to Youkinna, he posted home with all possible expedition, left an attempt should be made on the cattle in his absence. On his arrival at Aleppo, he was fo highly incenfed against the inhabitants, that he threatened them with death if they did not difannul the treaty with the Arabs, and deliver up the authors Couchy of of it into his hands. This demand not being immedi-Youkman ately complied with, he fell upon the citizens with great fury, and killed 300 of them; among whom was his brother John, whose head he caused to be struck off, charging him with being the author and abettor of the late permicious scheme. He would have made a much a greater flaughter, had not the Moslem army at that inflant arrived before the town; upon which Youkinna retired into the callle with a confiderable body of troops: but before this could be effected, he was obliged to futtain an attack from the Arabs, in which he lost 3000 men. The action was no fooner ended than the inhabitants of Aleppo brought out forty of Youkinna's men, and as a proof of their fidelity delivered them into Abu Obeidah's hands. Of these seven embraced Mahometanism, and the rest were beheaded.

He is besiecitadel.

Immediately after Youkinna had shut himself up in god in the the cattle, a council of war was held in the Moslem camp, wherein it was deliberated what measures were to be purfued on the prefent occasion. Khaled gave it as his opinion, that the caffle ought immediately to be attacked with all the Arab forces, before the emperor had time to fend them any affiftance. This advice was followed by Abu Obeidah, who caused the citadel to be immediately invested; and foon after he had fur- Arabia. rounded it with all his forces, made a most vigorous affault. The befieged defended themselves with great bravery, and after a very warm dispute drove the enemy into their camp; and as they threw a great many stones out of their military engines, many of the Mollems were killed, and a much greater number wounded. This encouraged Youkinna to make a fally with a strong party of the garrifon the following night. The fires being then out in the Moslem camp, and the besiegers not expecting fuch an unfeafonable vifit, 60 of them were killed on the fpot, and 50 taken prisoners. Youkinna, however, being briskly attacked by Khaled, who foon drew together a body of troops to oppose him, lost about 100 men in his retreat. The next day, he caused the prisoners to be beheaded in fight of the Moslem camp; and receiving advice that a strong party of Arabian cavalry was fent out to forage, he ordered a body of his horse to drive them to their camp; which they accordingly did, killed 130 of them, feized all their camels, horses, &c. and then retired to the mountains. Here they proposed to remain concealed till the following night, and then return to the castle; but Abu Obeidah, being informed of what had happened, detached Khaled and Derar with a body of troops to purfue the Greeks, and revenge the late affront. Khaled, being informed of the route the Christians had taken, possessed himself of the only pass by which they could return to the castle; and having posted there a body of his men whose courage he could depend upon, took 300 of the Greeks prisoners as they attempted to return, and put all the rest to the sword. The next morning, to retaliate Youkinna's cruelty, the prisoners were all brought out and beheaded in fight of the garrifon.

Notwithstanding this disaster, Youkinna made se-His vigorveral fallies with good fuccess, wherein he killed a ous desence

great number of the enemy, and haraffed them to fuch a degree, that Abu Obeidah found himself obliged, for his greater security, to remove his camp to about a mile's distance from the castle; by which manœuvre he likewise hoped that Youkinna would be less upon his guard. Herein, however, he found himfelf mistaken: for the Greek commander, by the prudent measures he took, eluded all surprise; and though Abu Obeidah continued the fiege for four months after the last-mentioned blow given to the garrison by Khaled, yet he had scarce any hopes of making himself master of it at last. Having nothing material to write to the caliph, he remained a long time filent; at which Omar being very much concerned, wrote to him, defiring an account of the affairs in Syria. Abu Obeidah acquainted him that the city of Aleppo had submitted to him; and that the citadel was the only place which held out in all that country, before which he had loft a great number of men, which, he faid, had induced him to think of raising the siege, and moving with his army in that track which lay between Antioch and Aleppo. This news was by no means agreeable to the caliph, who commanded his general to continue the fiege at all events, and fent him a reinforcement of Arab troops, together with 70 camels, to affift the in-

fantry in their march. Among the troops fent by Omar on this occasion, The citade, there was an Arab of a gigantic fize, called Dames, taken by

who hratagem.

apoftafy.

Arabia. who was a man of great courage and resolution. He observing the little progress made by the Moslems, bethought himself of a stratagem by which that fortress might be reduced, which feemed fo difficult to be accomplified by force. He therefore defired that Abu Obcidah would affign him the command of a party confilling only of thirty men; which at Khaled's request was readily granted. Then he begged the general to raife the fiege, and retire to about three miles distance from the callle, which was likewife immediately coinplied with. The following night Dames, who had posted himself with his party very near the citadel, found means to seize a Greek, from whom he learned that Youkinna, after the fiege was raifed, had exacted large fums of money from the citizens, on account of the treaty they had concluded with the Arabs; and that he was one of those who had endeavoured to make their escape from the oppression of such a tyrant, by leaping down from the wall. This man Dames took under his protection; but beheaded five or fix others who fell into his hands, and could give no good account of themselves. He then covered his head and shoulders with a goat's skin, and took a dry crust in his hand, creeping on the ground till he got close to the foot of the wall. If he heard any noise, or suspected any person to be near, he made such a noise with his crust as a dog does when he is gnawing a bone; his companions fometimes walking, and fometimes creeping after him in the same manner. He had before despatched two of his men to Abu Obeidah, to defire that a detachment of horse might be sent him by break of day to support his small party, and facilitate the execution of the plan he had formed. At last Dames found an opportunity of railing feven men upon his shoulders, who flood upon one another's shoulders in such a manner that the highest reached the top of the wall. Here he foon placed himself, seized a watchman whom he found affeep, and threw him over the Two others, whom he found in the same condition, he stabbed with his dagger, and threw them over likewise. Then he laid down his turban, and drew up the fecond of his brethren, as they two did the third, and by their help Dames himself and all the rest were enabled to mount the wall. He then privately stabled the fentry at each of the gates, and put his men in possession of every one of them. The soldiers of the garrison however, were at last alarmed, and furrounded the Arabs, who were on the point of perishing, when Khaled appeared at the head of a detachment of cavalry. On the fight of that general, who was now grown terrible to the Christians, the befieged threw down their arms, and furrendered at difcretion. Youkinna and fome of the principal officers turned Youk mna's Mahometans, in order to fave their possessions; and the castle, being taken by storm, was pillaged by the Moslems. Dames acquired great glory by this exploit; and, out of complaifance to him, the army did not decamp from Aleppo till he and his men were perfectly cured of their wounds.

After the reduction of the citadel of Aleppo, Abu Obcidah intended to march to Antioch; but was diverted by Youkinna, who was now become a violent enemy to the Christians. He told the Moslem general, that his conquest of that part of the country would not be complete without the reduction of Azaz, a place of great importance, where Theodorus, Youkin- Arabia. na's confin-german, was commandant. This fortrefs he propoled to become mafter of, by putting himfelf at the head of 100 Arab horse dressed in the Greek habit, who were to attend him to Azaz. Upon his arrival there, he was to affure Theodorus that he was still in reality a Christian, and had taken that opportunity to cscape from the Moslem camp. But, to make his story more probable, Abu Obeidah was to fend after him a detachment of 1000 horse, who were to pursue him as far as Morah, a village in the neighbourhood of Azaz, with orders to post themselves there; from whence, if fuch a measure should be found necessary, they might easily advance to Azaz, to facilitate the conquest of that place. To this scheme Abu Obeidah agreed; but Youkinna with all his men were immediately taken prifoners by Theodorus, who had been informed of the whole affair by a fpy in the Moslem camp, who had fent him a letter by a pigeon. The fortress, however, was soon reduced, and Youkinna regained his liberty; but was foon after taken prifoner a He is taken second time, and brought before his old master Hera-prisoner clius, who then resided at Antioch. He told the em-and brought before Heperor, that he had only pretended to embrace Maho-rachas metanism, in order to be able to do his Imperial Majefty the more effential fervice; and fo far gained upon him, that he was foon after appointed governor of that city; the confequence of which was, that the Araba were put in possession of it by his treachery.

The emperor being quite difficartened at his conti-Attempt to nual bad fuccefs, it was fuggefied to him by the king affaffinate of Ghassan, who had sled to him for refuge, as we Omar mishave already observed, that, however desperate his af-carries. fairs might be, they would be perfectly reftored by the affaffination of the caliph. This piece of fervice he undertook to perform for the emperor; and defpatched one Wathek Ebn Mosafer, an Arab of his tribe, and a refolute young man, to Medina for that purpole. Wathek, fome time after his arrival there, having obferved the caliph to fall afleep under a tree, on which he had placed himself so as not to be observed by any one, drew his dagger, and was upon the point of flabbing him; but, as the Arab writers tell us, he was deterred by a lion, who walked round the caliph, and licked his feet till he awoke, after which he inflantly went away. This struck Wathek with a profound reverence for Omar; he came down from his tiee where he had been confined by the hon, confessed his defign, and embraced the Mahometan religion.

Soon after the reduction of Antioch, Abu Obeidah The feat an account of his fuccefs to Omar; and receiving Greeks de-an order to invade the mountainous parts of Syria, he feated. asked his general officers which of them would command the body of troops deflined for that purpote. One Meifarah Ebn Melrouk having offered his fervice, the general gave him a black standard, with the following inferration upon it in white letters: " There is but one God; Mahoniet is the Apollle of God." The body affigued him for this purpose confished of 300 Arabs, and 1000 black flaves commanded by Dames. Meifarah, at the head of his troops, with fome difficulty afcended the mountains, and, with much more, advanced to that part where the emperor's

forces were posted. The cold was so intense on the fummits of those mountains, that the Arabs, who had

Arabia, been accustomed to a warm climate, could hardly bear "it. For fome time they could not meet with a fingle person to give them intelligence of the enemy's motions; but at last they took a Greek pusoner, who informed them, that the imperial army, which confifted of 30,000 men, lay encamped on a spot not three leagues ditlant. The perforer refuling to profels Mahometanism, they cut off his head, and then marched towards the imperial camp. The Greeks, hearing of their approach, advanced to meet them; and the Moflems being furrounded on all fides, were on the point of being all cut off, when Khaled appeared at the head of 3000 horse, and after him Ayab Ebn Ganem with 2000 more. At the approach of the horse under the command of the terrible Khaled, the Greeks retired, leaving all their tents, together with their rich furniture and effects, to the Arabs. In this engagement, one of Omar's chief favourites, named Abdalla Ebn Hodafa, was taken prisoner, and sent directly to Conflantinople. The caliph was fo much concerned at this, that he fent a letter to Herachus, desiring his releafe; which the emperor not only complied with, but made him many valuable prefents, fending at the fame 89 time a jewel of immense value as a present to the ca-Omar's dif-liph. This Omar offered to the jewellers of Medina, but they were ignorant of its value: the Moslems therefore begged him to keep it for his own use; but this he faid he could not be answerable for to the public. It was therefore fold, and the money deposited in the public treafury.

About this time also Khaled advanced with a body of troops as far as the Euphrates, and took Manbij, Beraa, Bales or Balis, exacting of the inhabitants 100,000 dinars for their prefent fecurity, and imposing on them an annual tribute for the future. He also made himself matter of Ranban, Dulouc, Korus, the Cyrus or Cyrrhus of the ancients, and feveral other fortified towns, nothing being now able to fland before him. Amru Ebn Al As now likewise prepared for the reducing fome places in Pal. fline that still held out. While he remained in this province, he had a conference with Constantine the emperor's fon, who endeavoured to perfuade him to make peace with the Christians; but this he not agreeing to, unless they would confent to pay tribute, all hopes of an accommodation vanished, and the generals on both fides prepared to enter upon action. In the mean time an officer came from the Christian camp, dressed in very rich apparel, who challenged the stoutest man among the Moslems to fight him in fingle combat. The challenge was accepted by a young Arab officer of Yaman; who being animated by a notion, derived from the prophet himfelf, that "the spirits of the martyrs rest in the crops of green birds, that eat of the fruits and drink of the rivers of paradife," discovered an uncommon eagerness to encounter his enemy. But the Christian officer not anly killed this youth, but two or three more of the Mossems who came to his assistance. He was then attacked by Serjabil Ebn Hosanah, one of the generals, but a man fo weakened by fasting, that he could scarce mand before him, and would therefore have been unbubtedly killed, had not a Greek horseman very opportunely interposed, and with one blow of his scimitar cut off the Christian's head. Serjabil, greatly furprised at this deliverance, asked the horseman who

he was, and from whence he came; to which he replied Arabia. in the following terms: " I am the unfortunate Toleiha Ebn Khowaid, who fet up for a prophet, and, lying against God, pretended to inspiration." In confequence of having faved his life, Serjabil introduced him to Amru; and writing a letter to Omar, wherein he acquainted him with the fignal proof Toleiha had given of his repentance, he obtained his pardon from

Though the two armies did not come to a general engagement, yet they had frequent skirmishes, in which the Arabs always got the better, and in some the Greeks fuffered very confiderably. This, together with the feverity of the feafon, which was then uncommonly cold, fo dejected the foldiery, that they began to defert in great numbers. Constantine, therefore, finding histroops to diminish daily, and the Arabs to grow stronger and stronger, took the advantage of a tempethous night to escape to Catarea, which Yezid had not been able to take, leaving his camp to be plundered by the enemy. This city was foon after invelted by Amru; and at the Youkinna fame time, Youkinna having made himself master of takes Tri-Tripoli by treachery, seized 50 ships from Cyprus and poli. Crete, which carried a supply of arms and provisions for the emperor's troops, and had entered the port without knowing that the Arabs were masters of the town. With these ships he undertook an expedition against Tyre; and telling the inhabitants that he brought a supply of arms and provisions for Constantine's army, he was admitted into the town, and received with great kindness. Here, however, he had not been long before he was discovered by one of his own foldiers, and put under arreft, with no of his men. The was however fet at liberty by the to whole care he was seinmitted; and then opened the gates of the town to texid, by Tyre and whom it had been invested. Constantine having got Cz area intelligence at Czesarea of the loss of Tripoli and Type, reducedwas so disheartened, that he set sail from that city with all his family and the greatest part of his wealth; and the citizens then thought proper to make the best terms they could with them. The furrender of this city was followed by that of all the other cities and fortresses in the province; and thus the Arabs drove the Greeks out of the whole country of Syria extending from the Mediterranean to the Euphrates. This conquest was completed in the 18th year of the Hegira, six years after it had been undertaken.

This year there happened such violent storms of hail Violent in the peninfula of the Arabs, that a confiderable extent florms, of territory was laid waste by them, and a great number of animals of various kinds destroyed. An epidemical distemper likewise raged at Medina, which spread itself all over the neighbouring territory, and swept away great numbers of people. Syria also was visited by a dreadful plague; fo that the Moslems lost there 25,000 men, among whom were Abu Obeidah himfelf, Yezid Ebn Abu Sofian, Serjabil, and many other persons of distinction. In short, so great was the mortality occasioned by the plague, both in Arabia and Syria, that the Arabs style the 18th year of the Hegira the year of destruction.

Amru Ebn Al As having now executed the caliph's Egypt reorders in Syria, set out on his expedition against Egypt. duced; His first attempt was on Tarma, a town situated on the ishmus of Suez. This he reduced after a month's

Acco. at the faire prophet.

fiege;

Arabia. siege; and having narrowly viewed its situation, he formed a design of cutting through the isthmus, and thus joining the Mediterranean and Red fea: but this project was not well relished by the caliph, who apprehended that it would facilitate the entrance of the Christians into the peninsula of Arabia. From Tarma he marched to Melr, the Memphis of the ancient geographers; which, after a fiege of seven months, was delivered up to him by the treachery of Al Mokawkas the governor. From Melr he continued his march towards Alexandria, and, having defeated the emperor's army, closely invested that city. While his army lay before this capital, Amru himself had the misfortune to be taken prisoner and carried into the town. Being brought before the governor, he asked him why he committed fuch ravages and depredations in the Chriflian territorics? To this Amru resolutely answered, "We are come hither to oblige you either to profess Mahometanism, or pay an annual tribute to the caliph; to one of which conditions you must submit, or be all of you put to the fword." A Greek who flood by hearing this, told the governor that Amru was certainly the Moslem general, and therefore desired him to cut off his head. Upon this Werdan, one of Amru's slaves, perceiving the extreme danger his master was in, gave him a box on the ear, exclaiming against his impudence for talking in fuch a manner. The governor being imposed upon by this shallow artifice, not only faved his life, but, to show his generolity, difmiffed him without ranfom. This was foon followed by thesloss of Alexandria, and that by the conquest of the whole kingdomes after which, Amru despatched Okba Ebn Nafe with a body of troops and energe farther into Africa, and that general into the infelf master of all the country lying between Barka and Zoweilah, renest which now forms the piratical kingdom of Tri-

together with Barca ducing under his dominion also that part of the contiand Tripopoli in Barbary. Soon after the Moslems had made themselves masters

of Alexandria, a grievous famine raged in Arabia, particularly at Medina, then the relidence of the caliph. This obliged Omar to write to Amru to fend him a fupply of corn, with which Egypt at that time abounded. In compliance with this order, Amru sent a train of camels laden with corn, in a continued line from Egypt to Medina; the first of which were entering Medina when the last were leaving Alexandria. But this method of conveying corn proving too tedious and expensive, he ordered him to clear the Amnis Trajanus of Ptolemy, now the Khalis, which runs from one end of Cairo to the other, of the fand and gravel with which it was choked. This he accordingly did, and by that means rendered the communication between Egypt and Arabia much more easy than it had formerly been.

96 The Perfians defeated.

While the Arabs thus extended their conquests in the west, they were no less successful in the east. We have already taken notice of Khaled's having been fent into Irak to reduce the kingdom of Hira, and of hisbeing recalled to affift in the conquest of Syria. Asthe kings of Hira were under the protection of the Perlian monarchs, the destruction of that kingdom neceffarily brought on a war with the Persians. After the departure of Khaled, the command of the forces was left with Abu Obeid Ebn Mafud, together with Al Mothanna-Ebn Haretha, Amru Ebn Hasem, and

Salit Ebn Kis. Abu Obeid having passed a river con- Arabia. trary to the advice of the other generals, was killed, and his troops in great danger; however, Al Mothanna made an excellent retreat, and repassed the river without any confiderable loss. After this he fortified himfelf in his camp till he received a confiderable reinforcement from the caliph; when the Moslem army marched to Dir Hind, and thence continued to make frequent excursions, ravaging that part of Irak that lay next to the Euphrates. A body of 12,000 chosen horsewas now despatched against those invaders, under the command of one Mahran. At first the Persians had the advantage, and obliged the Arabs to retire; but they were foon brought back by Al Mothanna, and the battle lasted from noon till funset. At last Al Mothanna, engaging Mahran in fingle combat, laid him dead at his feet; upon which the Perfians fled to Al Madayen, a town fituated on the Tigris, about a day's journey from Bagdad. After this a powerful army was despatched by the Persians under the command of one Rustam; but he also was killed, and his troops were entirely dispersed. At the same time, Abu Musa, another Moslem general, defeated a formidable body of troops under the command of Al Harzamam, a noble Persian, at Ahwaz.

Not content with those victories, foon after the reduction of Damascus, the caliph despatched Saad Ebn Abu Wakkas, to dislodge the Persians from some diftricts they possessed in the neighbourhood of the Euphrates. Saad having drawn together a body of 12,000 men, advanced to Kadelia, a city bordering upon the deferts of Irak; where having utterly defeated an army of 120,000 Perfians, he made himself maiter of the opulent city of Al Madayen, and possessed himself increable of Yezdejerd's treasure; which was fo rich, if we may trader from believe the Arabian writers, that Saad took out of it them, three thousand millions of dinars, amounting to two thousand and twenty-five millions of pounds iterling; an enormous and almost incredible fum. From thence Saad went to that part of the palace where the king's plate was deposited, which he carried off, as well as an immenfe quantity of camphire with which another part of the palace was entirely filled. This last the Arabs feem to have carried off merely for the fake of plundering, as they were fo much unacquainted with the nature of it, that they mixed it with their bread, which gave it a bitter and difagreeable tafte. Afterwards the Arab general carried off the crown and royal garments, adorned with gold and jewels of ineffimable value. He also plundered his armoury, which was well flored with all forts of weapons; after which he caused the roof of his porch to be opened, where he found another treasure equal in value to ten millions of crowns. He also found among the furniture of the palace a piece of filk tapeftry, 60 cubits square, which was adorned with a great variety of beautiful flowers, herbs, and plants, formed of gold, filver, and jewels, the most valuable that could be procured. This being brought to Omar, he cut it in pieces, and distributed it among the Moslems; and that part which fell to Ali's share, and which was yet none of the best, he sold for 20,000

In the twentieth or twenty-first year of the Hegira, Mes potathe Arabs, still unsated with conquest, invaded Me-ma redu-fopotamia under Aiyad Ebn Ganem, where the city of Edessa submitted on the first summons. From E-

Arabia. dessa he marched to Constantia, or Constantina, supposed to be the Nicephorium of the ancients. This he took by storm, as likewife Daras, where he massacred all the people he found in the place; and thefe repeated successes so terrified the rest of the sortified towns, that they all submitted without resistance. At the fame time Al Mogheriah Ebn Shaabah, one of the caliph's commanders, made himfelf mafter of Shiz, a place famous for the birth of Zerdusht the Persian philosopher, and overran the whole province of Aderbijan. He also possessed himself of all the country of Armenia bordering on Mount Taurus; nay, he in a manner obliged the whole region to own the authority of the caliph, and penetrated into Cappadocia. The fame year also Saad made himself master of Ahwas, the capital of Khuzestan (the ancient Susiana); in confequence of which he became mafter of the greatest part, if not the whole, of that province; at the same time that Al Nooman conquered the greatest part of Khorafan. But while Omar's troops were thus irrefistibly overrunning the finest countries in the known world, a period was put to his conquests and his life, by a Persian named Abu Lulua, who stabbed him thrice in the belly while he was performing his devotions at Medina. The reason of this was because the caliph refused to remit him some part of the tribute which according to the Mahometan custom he was obliged to pay for the free exercife of his religion. The Arabs, perceiving that he had killed their fovereign, immediately rushed upon him; but the affassin defended himself so desperately, that he killed seven of them and wounded thirteen: but at last one of the caliph's attendants threw his vest over him, and seized him; upon which he flabbed himfelf, and foon after expired.

Succeeded

Omar mur-

dered.

Omar having languished three days after the wounds. given him by the Persian, expired in the 10th, 11th, or 12th year of his reign, and after his death Othman Ebn by Othman Assan was chosen; though Ali had a better title, and feems indisputably to have been the most virtuous, if not the only virtuous person, as well as the bravest warrior among them. He was inaugurated in the 24th year of the Hegira, nearly coincident with the year of

our Lord 645.

Othman was no fooner fettled on the throne, than he commanded Al Mogheirah to complete the conquest of the territory of Hamadan; which he eafily accomplished, and at the same time reduced Bira, a strong castle in Mesopotamia, which either had never submitted, or had revolted on the departure of the Moflem troops out of that province. Another army, under Abdallah Ebn Amar, was also despatched into Persia, to deprive Yczdejerd of the poor remains of his dominions; and this was done fo effectually, that the unhappy monarch was obliged to fly to Sijestan and *bandon Perlia altogether.

In the 27th year of the Hegira, the island of Cy-prus was reduced by Moawiyah; who soon after conquered the island of Aradus, and took Ancyra; after which he reduced the island of Rhodes, broke in pieces Coloffic of the famous Coloffus, and fold the metal of it to a Jew **Rhoden dc-** of Edessa. In the mean time another of the Arab commanders entered Ifauria, where he committed dreadful depredations, plundering many towns and villages, putting a great number of people to the fword, and car-1ying off 5000 prisoners. In the 31st year of the He-

gira, one Habib having made an irruption into that Arabiapart of Armenia which was still unconquered, defeated a body of the emperor's troops, purfuing them as far as Mount Caucafus, and laying walle all the neighbouring territory. About the same time also, Abul Abar, who had been constituted admiral by Moawiyah, gave the emperor Constans a figual defeat by sca, on the coast of Lycia, in which such a number of Christians were killed, that the neighbouring fea was dyed with their blood.

But while Othman was thus carrying every thing ir-Infurrectirelifibly before him abroad, he neglected to fecure ons against the affections of his subjects at home, which soon prove the caleph.

ed his ruin. Sedition was industriously propagated through all the provinces of the empire, and articles of accufation brought against the caliph. The chief of these were, That he had recalled one who had been banished by the prophet; that he had removed Saad, an officer of diftinguished bravery, and supplied his place by one who drank wine, and was otherwise of a scandalous life; that he had fquandered away vast fums among his favourites; that he had removed Amru from the government of Egypt, to which he had preferred his own foster brother; and, lastly, that he had prefumed to fit on the top of Mahomet's pulpit, whereas Abu Beer had always fat on the highest step and Omar on the lowest. To this formidable accusation the poor caliph pleaded guilty, and promifed to make all the reparation in his power; but his condescension only served to increase the insolence of the rebels. They were however appealed by Ali; and public tranquillity had undoubtedly been restored, had it not been for Ayesha, & one of Mahomet widows, who preserved the deliruc-tion of the califia of a scheme true worthy of the wise of such a husband. That traitren, being delirous of raising one of her favourites named Telha to the dignity of caliph, prevailed on Merwan the fecretary of flate to write a letter to the prefect of Egypt, enjoining him to put to death Mahomet Ebn Abu Beer, with whom it was fent, and who was to be his facceffor. This letter Merwan took confidual be discovered: and Mahomet taking it for a graphine order of the caliph, published the supposed injury all over the neighbouring countries. He then marched with a body of rebels to Medina, where the innocent caliph was befieged in his palace; and, notwithstanding all his protestations, nothing less than his death could fatisfy the enraged multitude. In this deplorable fituation Othman fent to Ali for affiftance; who commanded his two fons Hafan and Hosein to defend the palace gates. This they did for fome time with fidelity enough, till finding the caliph reduced to great straits for want of water, they abandoned their posts; upon which the rebels easily

made themselves masters of the palace, and cruelly murdered the caliph, in the 82d year of his age, after He is murhe had reigned 12 years. His body remained three dered. days unburied; and was at last thrown into a hole made for it, without the usual ablution, or the least

funeral folemnity.

The arms of the Moslems had hitherto been so successful: and their conquests so rapid, that they may feem not only to have vied with Alexander, but to have bid fairer for univerfal monarchy than any nation either before or fince.—The ruin of mighty empires always originates from the impossibility of keeping them

irc.

Arabia. united. Divisions arise; civil wars break out; and the kingdom being weakened by these intestine seuds, the common enemies take advantage of them to ruin the whole fabric. If we confider Mahomet, as in truth he was, not as an enthusiast, but as a politician and the founder of an empire; we shall find him in that capacity superior perhaps to any that ever existed. The empire of Alexander the Great, which arose with full more rapidity than that of the Arabs, had no support but from his own ambition and perfonal quelifications. While he lived, he was without a rival, because all were afraid of him; but when he died, the bands of union, whereby his empire had been held together, were immediately disfolved. His captains were not inspired with the same veneration for his son, who was unborn at the time of his death, that they had for his father; and therefore they fought not to conquer for him, but for themselves; and the consequence was, that the kingdom fell to pieces the moment that he died. The fame thing happened to the empires of Jenghiz Khan, Tamerlane, and others, who made vaft conqueits in a thort time. They erected mighty empires indeed; but their duration, we may fay, was but momentary. The empire of the Romans was founded on a kind of enthuliallic defire of aggrandizing the city of Rome: patriotism became fashionable; and as the city never ceafed to exist, those who conquered always had the same end in view, namely to exalt the republic more and more. This empire, therefore, was not only gery extensive, but very durable; though, as it was impossible that mankind could always continue to vencfate a city, the fame divisions that ruined other empires at last brought this to an entire I he foundation of Mahomer's empire feemed to be till more firm. He was not only the King, but, we may lay, the god of his people. Whatever enthusiasm people may show in defending their country, nay even their nearest relations, experience has taught us that it is greatly inferior to what is shown by those who fight in defence of religion. This enthusiasm Mahomet had taken care not only to bring over to his tide, but to exalt to its highest pitch, by inculcating upon his followers, that their rewards in the next world should be proportionable to the fury with which they fought in this. To live at peace, except with those who submitted to his will, did not at all enter into his plan; and he who made no conquefts, or at least did not strive to make them, was no true believer. By this means, let his empire be ever so much extended, the temptation to making fresh conquests was still equally strong; and not only the commanders of armies, but every private perfon, had the most powerful motives, to urge him towards Causes of the conquest of the whole world, had that been poshe decline fible.—The only thing Mahomet feems to have failed of the Mof-in was, the appointment of the succession to the apostlethip; and why he was deficient in this is inconceivable. From this one fource proceeded the divisions which ruined his empire when it was scarcee crected, and of which we are now to give the history.

Though the prophet had been fo deficient in providing for the fafety of his kingdom as not to name a succesfor at his death; yet his fon-in-law Ali was always of opinion that the fuccession belonged of right to him; and that it ought to be, like that of other kingdoms, hereditary. This disposition to render the apostleship Vol. II. Part I.

hereditary in the family, was in all probability, what Arabia. difgusted the Moslems with Ali; against whom they could otherwife have no objection; for he was endowed with every amiable quality; a firm believer in Mahomet; Character and of fuch unparalleled itrength and courage, that he of Ali. never declined a combat to which he was challenged, nor ever failed to come off victorious; for which reason he was flyled by his countrymen, "the lion of God."

On the death of Othman, however, notwithstanding the prejudices against Ali, as none could pretend so good a right to the caliphate as he, the Arabs minean intention to break it as foon as possible, as was fully evinced by the event. The diffurbances which happened immediately on Ali's accession were owing partly to the machinations of Ayesha, who having got Othman murdered on purpose to raise Tellia to the dignity of caliph, and now finding. Ali unanimously chofen, refolved to destroy him also. She therefore pretended great concern for the death of the late callph, and accused Ah of being his murderer; but being reproved by one of the Moslems for endeavouring to blacken an innocent person, when she could not but know herfelf guilty; the replied, that Othman's infidelity had indeed made her his enemy, but that the had forgiven him upon his repentance. At the time of Ali's inauguration the was at Mecca, where the enjoyed a very confiderable flare of raffuence and authority. At her intigation, Telha Ebn Obcidall h, and Zober 107 Ebn Al Awam, began to represent to Ali, that the co-radial murderers of Othman ought to be brought to condiguate Ayes punishment; offering themselves at the lane time for that purpofe. This they did purely to low differnion, for they themselves had been deeply concerned in the murder; and Ah, fufficiently aware of their intention, told them it was impossible till the empire foodld be more fettled. Finding themselves disappointed in this attempt; they next begged the government of Cufa and Bafra, that they might with the greater facility extra guish any rebellion that should happen. Here tigen Ali was aware of their intention; and refu'ed then requeft, under pretence that he flood in need of perior of their great capacity, as counfellors, about his perfon. Then they defired leave to perform a pilgrimage to Mecca, which the caliph could not refuse; and they were no fooner got there, than they fet about raining an army against him without any provocation at all.

This, however, was not the only fource of discord and Mon at prefent. Ali had been displeased with the governors wiyah. of provinces appointed by Othman; and therefore difmissed them immediately upon his accession. This was very impolitic; but he was prompted to do it by that raffiness and want of prudence which is inseparable from, or rather is the very effence of, great courage. The consequence of this was, that Moawiyah, governor of Syria, was, immediately upon his difinifiion by Ali, proclaimed caliph by the troops under his command. Thus the Moslems were divided into two factions; the one under Moawiyah and Ayesha, who adhered to the house of Ommiyali, to which Othman and Mouwiyah belonged; and the other to Ali. The adherents of the house of Ommiyah were called Motavalites, or feparatifts.

Ali, finding how matters were fituated, and that a A' raife very strong party was formed against him, endeavoured an army

Arabia. to ingratiate himself as much as possible with the Koreith; and to raife an army against Ayesha, who had now taken the field, and even reduced the city of Bafra. He made a formal speech to the people on hearing this bad news, and defired their affiftance. But though he was very much beloved on account of his personal merit, and the best orator of the age, he could not with all his eloquence for some time prevail on them to give a decisive answer in his favour. At last Ziyad Ebn Hantelah stept to Ali of his own accord, and said, "Whofoever retreats, we will advance." Upon this two Anfars, doctors of the law, flood up, and pronounced Ali innocent of the death of Othman; which decision soon induced the Ansars and the body of the people to espouse his quarrel. He then left Medina with a body of 900 men, and advanced to Arrabah. where he was joined by feveral other parties. From this place he wrote to the people of Cufa and Medina, pressing them to fend him farther assistance, and to difpose the Motazalites to an accommodation. Medina he very foon obtained a large supply of horses, arms, and other necessaries; and from Cufa he obtained with difficulty a reinforcement of 8000 men.

Being greatly animated by this feafonable fupply, Ah advanced towards Bafra, where the troops of Ayesha were ready to receive him. Both parties seemed averie to an engagement; and Ayesha began to be very much intimidated at the fight of Ali's army, which however, was inferior to her own: but, by some means He deleats or other, a battle was at last brought about, in which Ayethi was defeated and taken prifoner. The only Aych-pir- remarkable effort that was made by the troops of Ayethat in this engagement, was in defence of her person. It is haid, that no fewer than 70 min who held her camel by the bridle, had their hands out off fuccessively; and that the pavilion in which the fat was fo full of darts and arrow, that it refembled a porcupine. Ayesha was treated very kindly by Ali, who at first fet her at liberty, but afterwards confined her to her house at Mediaa, and commanded her to interfere no more with state affairs, though he still allowed her to perform the pilgrimage to Mecca.

After this victory, Ali had no enemies to contend with either in Arabia, Irak, Egypt, Perfia, or Khoradas. A flrong party, however, still remained in Syria, headed by Moawiyah, who founded his claims to the caliphate on a pretended declaration of Othman that he should be his successor. In this defection he was joined by Amra Ebn Al As, who had obtained a promile of the government of Egypt, provided Moawiyah could be advanced to the dignity of caliph.

Ali, with his usual good nature, endeavoured to bring the rebels to a fense of their duty, and often fent propofals of accommodation to Moawiyah; but he still remained inflexible. Perceiving, therefore, that it would he necessary to invade Syria, he entered that country with an army of 70,000 men, while Moawiyah advanced to meet him with 80,000; and by repeated reinforcements Ali's army at last amounted to 90,000, and Moawiyah's to 120,000. The two armies came in light of each other towards the close of the 36th year of the Hegira, when they feemed ready to enter upon action; but only fonce skirmishes happened between them, wherein neither party fulfained any confiderable lofs. The first month of the 37th year was

spent in fruitless negotiations; but in the second month Arabia. they began to fight in different parties, without ever hazarding a general engagement. These battles continued, according to fome, for 40 days, and according to others, 110. Moawiyah's lofs amounted to 45,000 men, and Ali's to 25,000, among whom were 26 who had been intimately acquainted with Mahomet himself, and were dignified with the title of The Companions. The most famous of these was Ammar Ebn Yasar, Ali's general of horse, who was upwards of 90 years of age, and was highly esteemed by both parties. The lofs of this general fo exasperated Ali, that he charged the Syrians with a body of 12,000 men, broke them, and challenged Moawiyah to fight him Moawiyah in fingle combat. This challenge Moawiyah declined, challenged infisting that it was not a fair one, as Ali could not to a fingle but be fensible of his superiority in strength. As the Ali. challenge was given in the hearing of both armics, Amru infifted that Moawiyah could not in honour refuse it; but the coward made no other reply than that Amru aspired to the caliphate himself, and wanted to enjoy it after his death. The battle being now renewed with great fury, Moawiyah's forces were pushed to their camp; which had certainly been taken, had not Amru bethought himself of the following stratagem Amru's to retrieve Moawiyah's affairs, when he feemed on the fracagem. very brink of destruction. He ordered some of his men to fix copies of the Koran to the points of their lances, and carry them to the front of the battle, crying out at the fame time, "This is the book that ought to decide all differences between us; this is the book of God between us and you, that absolutely pro-hibits the effusion of Moslem blood. This produced the desired effect. The caliph's troops threw down their arms, and even threatened him with death if he did not found a retreat; which he therefore found himfelf obliged to do, and thus had a decifive victory wieft-

ed out of his hands. According to this new mode of decision, the two parties were each to choose their arbitrator; but even this was not allowed to Ali, though Moawiyah had liberty to choose Amru Ebn Al As. The troops of Irak, not content with offering fo grofs an affront to the calipha infilled on naming for his arbitrator Abu Musa Al Ashavi; a very weak man, and one who had already betrayed him. The consequence of this appointment was, that Ali was deposed by both the arbitrators; and Ali deposed. he accordingly dropt his title to the caliphate, but without laying down his arms, or putting himself in Moawiyah's power.

After this decision, Ali retired to Cufa; where he was no fooner arrived, than 12,000 of these troops who had themselves forced him to acept of the arbitration, pretending to be offended with the step he had taken, revolted from him. These were called Kharejites, that is, rebels or revolters: and Mobakkemites, or judiciarians, because they affirmed that Ali had referred to the judgment of men what ought to have been only referred to the judgment of God; and, therefore, that inflead of keeping the peace he had made with Moawiyah, he ought to purfue his enemics, who were likewise the enemics of God, without mercy. To this Ali replied, That as he had given his word, he ought to keep it; and, in so doing, he only followed what was preferibed by the law of God. The Kha-

Arabia. rejites replied, That God was the only judge between - him and Moawiyah, and that confequently he had committed an enormous fin, of which he ought-fincerely to repent. This irritating Ali, he with some warmth replied, That if any fin had been committed on this occasion, it was by themselves, who had forced him to take the steps of which they now complained. This answer not proving agreeable, they chose for their ge-Ic descats neral Abdallah Ebn Waheb, who appointed for their he Khare- rendezvous Naharwan, a town fituated between Waset and Bagdad, about four miles to the eastward of the Tigris. Here they affembled an army of 25,000 men; and Ali, having tried gentle methods ineffectually, at last marched against them in person. Before he attacked them, however, he planted a standard without the camp, and made proclamation by found of trumpet, that whoever should repair to it should have quarter, and whoever would retire to Cufa should find a fanctuary there. This had fuch an effect, that Abdallah's army was foon reduced to 4000 men, with whom he rushed upon the caliph's forces; but all of them were cut in pieces, except nine who escaped.

Had Ali marched against Moawiyah immediately after the defeat of the Kharejites, and while his troops were flushed with victory, he had probably reduced him entirely: but by allowing his troops to refresh themfelves, they all deferted him, and Moawiyah's party had an opportunity of gathering still more strength; and though Moawiyah's troops often made incursions into the territories of Ali, the latter feems afterwards to have acted only on the defensive. At last the Kharejites, imagining that it would be for the good of the uurder Ali, Moslem affairs that Moawiyah, Ali, and Amru, were mru, and dead, despatched affassins to murder all the three. Moawiyah was wounded, but recovered; Amru's secretary willed by mistake; but Ali was wounded with a

postoned sword, which occasioned his death. The asfassin was taken, and Ali would have pardoned him had he recovered, but ordered him to be put to death if he died, that he might, as he faid, " have an immediate opportunity of accusing him before God." Even in this order he showed his usual elemency, as he ordered the affaffin to be despatched at one blow, and without torture of any kind.

Thus fell Ali, the most virtuous of all the Mahometan caliphs, after he had reigned near five years, and lived 63. He was pressed by those about him to nominate a successor before he died; but this he declined, saying, he would follow the example of the Apostle of God, ucceeded who had not named any: and, as his fon Hafan y Hasan: inherited his father's piety, though not his courage, he was declared caliph without any scruple. Moawiyah, however, behaved in such a manner towards him, as showed his hostile intentions; and those about Hasan pressed him to declare war immediately. This Hasan, who was of an exceeding mild and peaceable disposition, could hardly be perfuaded to do; and though he at last took the field, yet he immediately perceived his incapacity to dispute the empire with Moawiyah; and therefore refigned it, in spite of all the remonstrances aliphate to of his friends, to a traitor, who caused him after some Moawiyah years to be poisoned by his wife.

Moawiyah being thus left fole master of the Moslem empire, found himself under the necessity of reducing the Kharejites, who were his enemies as well as Ali's, and had now gathered together a confiderable army. Acid a. Against these rebels the callph would have despatched Hafan, but that prince refuted; upon which he fent the Syrian troops against them, who were defeated: however the Cufans, being at last perfunded to take up arms, foon extinguished the rebellion, and fettled Moawiyah more firmly than ever on the Moslem throne. In the 48th year of the Hegira, the camph tent his fon Yezid with a powerful army to beliege Conflantinople. Conflanti-In this expedition he was attended by three or four of hor's bethe Companions, who, notwithstanding their age, wer fig d withprompted by zeal to undergo incredible fatigues. The out faccels Moslem forces too, though they suffered extremely, were animated to furmount all difficulties by a tradition, according to which the prophet in his lifetime declared, "That the fins of the first army that took the city of Cafarea should be forgiven." Concerning the particulars of this expedition we are in the dark; only, in general, that it proved unfuccessful; and in it Abu Ayub, who had been with Mahomet at the battles of Bedr and Ohod, loft his life. His tomb is held in fuch veneration by the Moslems, that the fultans of the Ottoman family gird their fwords on at it on their acceffion to the throne. In the 54th year of the Hegira, the Arabs made an irruption into Bukharia, und defeated a Turkish army that opposed them. The Turks Turks deloft a great number of men; and the queen, who com-feated. manded in person, with great difficulty made her escape. She had only time to put on one of her buskins; the other fell into the hands of the Arabs, who valued it at no less than 2000 dinars. About this time also, according to the Greek historians, a treaty was concluded between the emperor and the Mollens, whereby the latter were allowed to keep the territories they had feized; in confideration of which they were to pay 3000 pounds weight of gold, 50 flaves, and as many choice horses. To these dishonourable conditions they were obliged to fubmit, in confequence of their late unfuccefsful expedition to Conftantmople, and fonce other defeats they had received. This peace was to cortinue for 30 years. The next year, Monory th, he ing conferred the government of Khorafan upon Saac, Othman's grandfon, that general, foon after his picmotion, passed the Jihun, or Amu, the Oxus of the ancients, and advanced with a body of troops to Samarcand, which opened its gates to him on his approach; foon after which he defeated an army of Ufbeck Tartars, and marched directly to Tarmud, or Tarmid, which also furrendered without opposition. The 57th year of the Hegira was remarkable for nothing but vast swarms of locusts, which did incredible damage in Syria and Melopotamia; and great discontents on account of the caliph's having nominated for his furceffor his fon Yezid, a person of scandalous life, and no way worthy of the throne. The 58th year of the Hegira was rendered remarkable by the death of Ayesha, Mahomet's widow; and the both by that of 12t Moswiyah Moawiyah, after having reigned from Hafan's refig-dies. nation, nineteen years, three months, and five days; but concerning his age authors are not agreed. He was interred at Damascus, which was made the refidence of the caliphs as long as the house of Ommiyah continued on the throne.

Yezid was proclaimed, in confequence of his nomi-succeeded nation, the same day his father died. His inaugura-by Yezid.

tion

133

Arabia. tion was performed on the new moon of the month Rajeb, corresponding to April 7. 680. Immediately after his election, he wrote to Al Walid, governor of Medina, to seize Hosein, the remaining son of Ali, and Joseph and Abdallah Ebn Zoheir, in case they refused to acknowefuse to ac-ledge his right. He accordingly tendered the oath of mowledge allegiance to Hoscin, who returned an evalive answer, and found means to escape to his own house. As for Abdallah, he delayed waiting upon the governor, under various pretences, for 24 hours; after which he made his escape to Mecca; hither Hosein followed him; but received an invitation from the people of Cufa, who promifed to affift him in vindicating the rights of his father Ali and himfelf. In the mean time, Yezid, being informed of Al Walid's negligence in fuffering Abdallah and Holein to escape, removed him from his employment, appointing in his room Amru Ebn Saad, at that time commandant of Mecca. The new governor immediately despatched against Abdallah Amer Ebn Zobeir, Abdallah's own brother, who mortally hated him: but Abdallah, having engaged Amer in the field, defeated and took him prisoner; which greatly raised his reputation at Medina, although Holein's superior interest among them still rendered him incapable of aspiring to the caliphate by himself.

While Abdallah was thus strengthening himself at Mecca and Medina, Hofein was doing the fame at Cufa. On the first notice of their inclinations, he had feut to them Moslem Ebn Okail, to whom, as representative of the son of Ali, they had taken an oath of allegrance, and were now very pressing on Hosein to honour their city with his presence. Belides this, Hofein was supported by the forces of Irak, who retained a great veneration for the memory of his father, and had all along confidered the government of Moawiyah

as a downright usurpation.

Notwithstanding all these steps taken at Cufa in favour of Hosein, the deliberations of the conspirators were carried on with fuch fecreey, that Al Nooman, the governor, continued a stranger to them, even after the Cufans had determined immediately to enter upon action with an army of 18,000 men. At last, however, he began to be roufed from his lethargy; but Yezid being displeased with his conduct, removed him from his government, appointing for his successor O-beidallah Ebn Ziyad. This governor entered the city in the evening, and was received with all possible demonthrations of joy by the Cufans, who mistook him for Hosein, owing to a black turban which he had on his head, refembling that which Hofein usually wore. His first care was to extinguish the sedition that had been excited by Moslem. In order to this, he commanded a trufty fervant to disguise himself, and personate a stranger come out of Syria to see the inauguration of Holein; that he might get admission into Moslem's house, and penetrate all his councils. This comwiffion was faithfully executed; and Obeidallah understanding that Moslem lodged in the house of one Sharik, who was then fick, fent a messenger to Sharik, Letting him know that he intended to vifit him on a tertain day. Sharik immediately came to a refolution to receive him, and appointed Moslem a place in the corner of the room whence he might rush out up-Dbeidallah and kill him. The vifit was accordingmade; but Moslem's heart failing him, the gover-

nor escaped: Hani, however, in whose house Mossem Arabia. had first lodged, was imprisoned by Obeidallah. Upon the news of this, Moslem assembled about 4000 men, and befieged Obeidallah in the castle. The governor, however, not in the least dispirited, made a speech to Moslem's followers; which had such an effect upon them that they all deferted him except about 30. By the favour of the night, Moslem escaped to a poor woman's cottage in the neighbourhood; but being betrayed by her fon, Obeidallah fent a detachment of 80 horse to seize him. Moslem made a gallant resistance, and thrice cleared the house of them; but being at last overpowered with numbers and grievoully wounded, he was taken and brought to Cufa. While on the road, he endeavoured to fend an account of his bad fuccess to Hosein, then, as he supposed, on the road to Cufa; but without success. When arrived at the caille he begged a draught of water: but those who stood by told him he should have none till he drank the hamim, or boiling liquor, which the Mahometans pretend is drunk by the damned in hell; and foon after this, being brought before the governor, he was beheaded along with Hani, and both their heads fent as present to Yezid.

Hosein, in the mean time, was preparing to fet out Hosein's for Cufa, having received the most favourable advices obstmacy. from Moslem, of whose fate he was ignorant, and who had fent him a lift of 140,000 men that were ready to obey his orders. This the wifest of his friends reprefented as a desperate enterprise, and entreated him to drop it, or at least to defer he course will be should be better affured of success: but he would be deaf to all salutary counsels, may, he would be most earness entreaties, be prevailed upon to the wives and children along with him. The purchase of this obstinacy may easily be imagined; Charles and despatched first 1000, and then 5000 this against this. with orders, however, not to offer any violence to him provided he submitted himself. To these terms the infatuated Hosein was agree: he offered indeed to return home, if Observation would permit; but that not being granted, he desperately engaged the troops of Obeidallah, and was, after long refilance, cut in He is depieces with all his men. His head was brought to feated and Obeidallah, who firuck it over the mouth with a flick, and treated it with great contempt. He was also inclined to have put his family to death: but probably feared an infurrection, as the people of Cufa expressed great refentment on account of Hofein's death; nor was it at all agreeable to the caliph Yezid, who treated the family of the unfortunate Hosein with the greatest

kindnefs. This year, the 61st of the Hegira, Yezid appointed Salem Ebn Ziyad governor of Khorasan; who, soon after entering upon the government, made an irruption into the Turkish territories. He took his wife along with him in this expedition, who was delivered of a child in the neighbourhood of Samarcand; on which occasion she is faid to have borrowed some jewels from the prince of Sogd's lady, which the afterwards carried off with her. In the mean time Salem detached Mohalleb with a confiderable body of troops to Khowarazm, the principal city of the Turks or Tartars in those parts, from which he extorted the immense sum of 50,000,000 pieces of money; from whence advancing

Abdallah

mally de-

pofed.

ealiph.

Arabia. to Samarcand, he forced the inhabitants of that city -also to pay him an immense sum; and then retired, with little lofs, into the province he governed.

In the mean time Abdallah Ebn Zobeir, finding himself, by the death of Hosein, at the head of the partizans of the house of Hashem, who were greatly oppressed by Yezid, began in carnest to aspire to the caliphate. As he had therefore never owned the authority of Yezid, he now openly declared against him, and was proclaimed caliph at Medina foon after the arrival of Hosein's family in that place. Soon after his proclaimed inauguration, to render himself the more popular, he expatiated on the circumflances of Hosein's death, which indeed were very tragical, and represented the Cufans as the most abandoned and persidious villains upon earth. This went fo well down with the citizens of Mecca and Medina, that they flocked to him in great numbers, so that he soon found himself at the head of a confiderable force. The caliph Yezid being informed of his progress, swore he would have him in chains: and accordingly fent a filver collar for him to Merwan, then governor of Medina; but the interest of Abdallah was now fo strong, that he laughed at the menaces both of the caliph and Merwan. Nay, the governor of Mecca, though he fecretly hated him, thought it good policy, as matters then stood, to keep up a good understanding with Abdallah : but this coming to the ears of Yezid, he deposed the governor; appointing in his place Walid Ebn Othah, a man of known fidelity, and a bitter enemy of Abdallah. well and the presence of Modulan. The sacw governor, therefore, immediately on his accession, used all his accession, used all his accession to latter was always on his guard. This conduct interpret, giving his great disgust, as well accessible apprehensions, he wrote to the caliph, informing him that all the disturbances were owing to the conduct of the caliph, informing him that all the disturbances were owing to the netradable disposition of Walid; and that, if he would fend a person of a different character, peace would foon be refleved. This letter the caliph very injudicionally gave ear to, the faithful governor, appointing in his result who was totally unqualified for that post. The people of Medina, now having fresh intelligence of Yezid's dissolute manner of life, renounced their allegiance to him, and formally deposed him in a very singular manner. After they Yezid forhad affembled in the mosque, about the pulpit there, one of them faid, " I lay afide Yezid as I do this turban," and immediately threw his turban on the ground. Another faid, "I put away Yezid as I do this shoe," casting away his shoe at the same time. These examples being followed by others, there was a large heap of shoes and turbans almost instantly formed upon the spot. They then dismissed Yezid's governor, and banished from the city all the friends and dependents of the house of Ommiyali. These, to the number of about 1000, took refuge in the house of Merwan Ebn Al Hakem, where they were so closely besieged by Abdallah's party, that they found themselves obliged to fend to Yezid for immediate affiltance; acquainting him, that if they were not succoured, they must all inevitably perish. The caliph, though he wondered that fuch a number of men should fuffer

themselves to be so cooped up without making the Icast refishance, despatched Moslem Ebn Okba to Medina, with a confiderable body of troops, to quall the Ambia disturbances. He ordered him to spare Ali the son of Hosein and his family, as they had no hand at all in the diffurbances: then he was to fummon the town of Medina to furrender for three days successively; which if they refused, he was to take it by storm, and give it up to be plundered by the foldiers for three whole days.

The inhabitants of Medina being now fenfible of their danger, fuffered the friends of the house of Ommiyah to withdraw quietly out of the city; though before they departed, a promise was extorted from them not to appear in arms against the reigning faction. Moslem, in the mean time, advanced towards the city at the head of 5000 foot and 12,000 horse; and having fummoned it according to his instructions, upon its refufal made the necessary preparations for an attack. The garrifon, however, for a confiderable time, made a vigorous defence; but at last, most of the Anfara and principal officers being killed, the Arabs proposed a capitulation. Moslem, however, would hearken to Medina tano terms, and infifted on their furrendering at difere-ken and tion; which being refused, he entered the city after a plundered faint refistance. All was treated with great respect; by the cabut all the men that had carried arms were put to the liph'sforces. fword, and Moslem suffered his troops to ravish 1000 women, and to pillage the city for three days succes-Those that escaped the slaughter he forced to acknowledge themselves the flaves and vaffals of Yezid. For this extreme severity he was surnamed by the Arabs Al Mufrif, or The extravagant, and ever after confidered as an impious person, especially as the prophet had declared that the wrath of God should most certainly remain upon those who sacked or plundered the city of Mediha.

Ater the reduction of Medina, Mossem directed his course to Mecca, where Abdallah then resided; but he died by the way, and the command of the troops devolved upon Hosein Ebn Thamir Al Selwi. The general advanced to Mecca, which he belieged for 40 days, battering the town with fuch fury, that he beat down a great part of the famous temple there, and burnt the rest; nor would the city itself have escaped the same fate, had not an end been put to the war by the arrival of certain accounts of the death of Yezid, who departed this life in the 64th year of the Yezid dies. Hegira, answering to the year 684 of the Christian era, having lived 39, and reigned three years and fix or eight months. On the news of his death, Hosein offered to take the oath of allegiance to Abdallah; but the latter at that time durst not trust him, of which he

had afterwards sufficient reason to repent. Yenid was succeeded by his son Moawiyah II. who Mowiyah was proclaimed caliph at Damaseus the same day that II. pro-his father died; but being of a weakly constitution, and claimed cal ph, and unable to bear the fatigues of government, refigned the refigns. crown fix weeks after his inauguration, and died foon

after without naming a fuccellor.

This abdication having left the Moslem empire absolutely without a master, great commotions ensued. On the death of Yezid, Obcidallah Ebn Ziyad, governor of Basra, represented to the citizens that they ought to choose a protector till a new caliph should be chosen; and if the person so chosen should be disagree-

able

able to them, they might then remain in a flate of independency under the protector whom they had chosen. The inhabitants, perceiving the drift of this speech, complimented him with that honour; which he accepted with feeming difficulty: but fending a deputy to Cufa, the inhabitants of that city not only refused to acknowledge his authority, but threw dust and gravel at his messenger. This coming to the ears of the peo-Obeidallah ple of Bafra, they not only deprived Obeidallah of forced to fly the dignity they had newly conferred upon him, but into Syria. even expelled him the city. Nor could he prevail upon the Najari, a tribe of Anfars, to espouse his quarrel, nor even upon his own relations, though he distributed among them great part of the fixteen millions of pieces of money which he had found in the treasury of Basra, and kept the remainder to himfelf. Nay, fo odious had he rendered himself to all ranks, on account of his cruelties, particularly the death of Hosein the son of Ali, that his brother Abdallah was unable to protect him from the fury of the populace, though he kept him concealed in women's clothes, and diffributed among the mob 200,000 pieces of money. He was therefore at last constrained to leave the city, attended

> by a guard of 100 men. Immediately after his departure, the mob plundered his house, and pursued him,

> fo that he was obliged to exchange his camel for an als, and thus with the unnost difficulty escaped into

> Syria. In the mean time, Hosein Ebn Thamir, being returned into Syria with the forces under his command. gave a faithful account of the fituation of affairs in Arabia to Merwan Ebn Al Hakem. He also acquainted him of the offer he had made to Abdallah of the oath of allegiance, which the latter had refused, or at least would not come to Damascus in order to be invested with the supreme authority there. On this account he advised Merwan to take care of himself and the rest of the house of Ommiyah, who had fled to Damascus after their expulsion from Medina. On this discourse Merwan was inclined to submit to Abdallah; but was diverted from it by Obeidallah, who infifted that no fuperior ought to be acknowledged by Merwan, who was at the head of the Koreish. The people of Damascus had constituted Dahak Ebu Kais their protector, who inclined to Abdallah. The Basrans were at this juncture entirely in tumult and confusion, not being able to agree about a protector after the expulsion of Obeidallah; so that at last they wrote to Abdallah, offering him the government of their territory. This he accepted, but could not be prevailed upon to stir from Mecca: nor could Merwan be perfuaded to fuffer any of the Syrians to perform the pilgrimage to Mecca, left they should join Abdallah, and thereby contribute to his exclusion from the throne.

132 Merwan proclaimed caliph at Damascus.

In the midst of this confusion Abdallah might have eafily secured the caliphate to himself, had he not with the utmost imprudence as well as inhumanity given orders for the extermination of the house of Ommiyah. This ruined his affairs; for they being now obliged to provide for their own fafety, Merwan was proclaimed saliph at Damascus; and thus the whole Moslem empire was rent into two potent factions, the one under Merwan and the other under Abdallah.

We have already observed, that Dahak Ebn Kais

inclined to favour Abdallah. This he continued to do Arabisafter Merwan was proclaimed caliph, infomuch that a battle foon enfued between his followers and those of Merwan, in which Dahak was defeated and killed; and thus Merwan became mafter of all the province of Sy-Soon after this victory, Merwan advanced with a confiderable body of troops towards Egypt; but fent before him Amru Ebn Said with a detachment, in or-der to facilitate his passage. That general having defeated Abdalrahman, Abdallah's lieutenant, in several brisk actions, he at last surrendered the whole country to Merwan for a fum of money, and retired with the Arabs under his command to Hejaz. The Syrian troops, therefore, immediately took possession of that country, and obliged the inhabitants to take an oath of allegiance to Merwan; who having appointed his fon Abdalazziz to prefide over Egypt, returned with the greatest part of his forces to Damascus. Here he was informed that Abdallah had despatched against him Abdallah's his brother Musab with a considerable army. Against forces dehim Merwan despatched Amru Ebn Said; who having feated by soon come up with him, gave him a total deseat, and Merwan's. dispersed his troops in such a manner that Musab sound

it impossible to rally them again.

In the 65th year of the Hegira, the inhabitants of The Cufans Cufa, pretending to be seized with remorfe of con-revoltscience for their treachery to Hosein the son of Ali, raifed an infurrection against both the caliphs, and therefore assembled a body of 16,000 men, under the command of one Soliman, who was to revenge the death Joined by of Hosein upon Obeidallah Lander and his adhe Al Mokhrents. But while Soliman and his adhe Al Mokhrents. But while Soliman and his adhe Al Mokhrents. Al Mokhrar, who hadre and was disgusted at not having expected, arrived at Cufa, and appears to have been actually upon the first had appears to have been actually upon the first had appears to have been actually upon the first had appears to have been actually upon the first had appears to have been actually upon the first had appears to have been actually upon the first had appears to have been actually upon the first had a second appears to have been actually upon the first had a second appears to have been actually upon the first had a second and the second appears to have a second appears to have a second and the second actually upon totally unfit for fuch an enterprise of the the command upon himself. This, however, was refused; and as Al Mokhtar had no opinion of Soliman's military capacity, he found more to draw off 2000 of his troops; while 1000 more choic rather to violate the oaths they had taken, than run the risk of being cut to pieces by a superior enemy. Soliman, Soliman's however, put a good face upon the matter; and, telling folly and his troops that they were to fight for another world enthulialm and not this, fet forward to invade Syria with the 4000 who remained with him: but being advanced as far as Eksas upon the Euphrates, he found that he had lost 1000 men by defertion; nor was he joined by the Separatifts of Bafra and Al Madayen, though they had promised him a reinforcement. Firmly persuaded, however, that his cause was the cause of heaven, Soliman continued his march all night, and next day arrived at the tomb of Hosein, where his men performed their devotions with fuch enthuliasm of penitence, that one present swore he never saw such crowding about the black stone in the temple of Mecca itself .- Continuing still to advance, he received a friendly letter from Abdallah Ebn Yezid, the governor of Cusa, advising him to return, and representing to him the folly of engaging so powerful an army as would be sent against him, with an handful of men: but Soliman, imagining that he was only recalled in order to support Abdallah Ebn Zobeir in his pretensions to the caliphate, persisted

117

Merwan

dies.

Arabia in his resolution of penetrating into Syria. He told his troops, that they would never be nearer the two Hoscins (Hosein, and his brother Hasan, to whom also the Shiites give that name) than they were at prefent; and that should they at this time meet with death, they would be in a state of repentance, and consequently could never die in a more proper time; and after this speech, continuing still to advance, he was at last He is cut in met by Oberdallah at the head of 20,000 horse, who, pieces with after an obstinate engagement, cut to pieces Soliman

all his men. and all his troops. 138

Soon after this decisive action died the caliph Merwan, after he had reigned eleven months. He is faid by some authors to have been poisoned by his wife Zeinab, Moawiyah's widow. Her he had married, with a promife that her fon Khaled should succeed him; but afterwards altering the succession in favour of his own fon Abdalmalec, young Khaled reproached him with his breach of promise: upon this Merwan calling him bastard, the child complained to his mother; who, to be revenged for this affront, is faid to have poisoned him, or smothered him with a pillow.

In the beginning of the caliphate of Abdalmalec, Al Mokhtar, who had been imprisoned by the governor of Cufa, was released at the intercession of Abdallah Ebn Omar, who had married his fifter. The year fol-

lowing, having put himself at the head of the Shiite sectaries, he sent proposals of alliance to Abdallah Ebn Zobeir; but he, juilly suspecting his sincerity, by a stratagem cut off near 3000 of his men. Upon this dif-

natagem cut on near 3000 of his men. Upon this dilater, Al Mokhen fearing the house of Ali might be intimidated, the fearing the house of Ebn Hanifyah, one of that the fearing the offered his affiliance. Narrow e- with the fearing the for pacific measures; but though family of Ali.

This offer Mahomet declined, for pacific measures; but though family of Ali.

The transfer of Ali's family behaved in the most prescribe manner, Abdallah did not think himself safe till are organized. till they owned all authority. He therefore imprisoned them, together with 17 of the principal citizens of Cufa, whom he threatened the per to death, and afterwards burn their bodies, if the stid not within a limited time take an oath of allegiance to him. Al Mokhtar being informed of the diffressed situation they were in, fent a body of 750 horse to Mecca, under Abu Abdallah, to release them. That general not only executed his orders with great bravery, but took Abdallah himself prisoner, whom he would have cut to pieces on the ipot, had he not been released at the intercession of Mahomet, who for the present adjusted the differences to the mutual fatisfaction of all parties. After this reconciliation, Abu Abdallah, or rather Maliomet himfelf, diffributed among 4000 of Ali's friends a fum of money brought for that purpose, in order to indemnify them for the losses they had sustained. Thus the friends of Ali were happily delivered, when only two days of the time granted them by Ahdallah remained, and a fufficient quantity of wood and other combustibles was collected, in order to confume their bodies. Notwithstanding the reconciliation, however, that had lately taken place, Mahomet Ebn Hanifyah thought proper to post himself on a mountain near Mecca with a body

> of 4000 men. The Cufans having received advice before Merwan's death, that he had sent Obeidallah with a powerful army towards their city, and even given him permif

fion to plunder it in case it should be taken, appointed Arabia. Yezid Ebn Ares, a man of undaunted courage, to oppose him; but Merwan dying before Obeidallah could execute his commission, an end was put for the present to this expedition. The memory of it, however, still remained; and Al Mokhtar, to whom Obeidallah was personally obnoxious, assembled a body of troops to act offensively against him, and even against the Syrian caliph himself in case he should support Obeidallah. A-Impiery of mong other preparations for this enterprise, A! Mokh-Al Mokhtar caused a kind of portable throne to be made, tell-tar. ing his troops, that, " it would be of the same use to them that the ark was to the children of Ifrael." was therefore carried on a mule before the troops that were to march against Obeidallah, and the following prayer said before it: " O God! grant that we may live long in thy obedience; help us; and do not forget us, but protect us." This expedient was fo well adapted to the hot-headed enthufialts who composed Al Mokhtar's army, that they attacked Obeidallah's Obeidallah camp, defeated him, and gained a complete victory. defeated Obeidallah himself was killed in the action, his head and killed. fent to Al Mokhtar, and his body reduced to ashes .-By this victory the sectaries were rendered so formidable, that Nifibin or Nifibis, and feveral other cities, furrendered to them without opposition. They now began to entertain thoughts of depoling both the caliphs, and placing on the Moslem throne one of the family of Ali; but all their towering hopes were foon frustrated by the defeat and death of Al Mokhtar by Musab brother to Abdallah Ebn Zobeir. Al Mokhtar, Al Mokh-

after being defeated in a general engagement by Mu-tar defeatfab, fled to the callle of Cufa, where he defended him-ed and killfelf with great bravery for some time; but being at last cd by Mukilled, his men, to the number of 7000, furrendered at fab. diferetion, and were all of them put to the fword on account of the outrages they had committed.

The next year, the 68th of the Hegira, the Azarakites, fo denominated from Nafe Ebn Al Azarak, the author of their feet, having affembled a confiderable force, made an irruption into Irak. They advanced almost to the gates of Cufa, and penetrated to Al Ma-Horrid dayen. Being fworn enemies of the house of Ommi-cruelties yah, and acknowledging no government, spiritual or committed

temporal, they committed terrible ravages in every part by the Aof the Moslem territories through which they pasted. zarakites. They carried their excesses to such a height as to murder all the people they met with, to rip open women with child, and commit every species of crucky that could be invented upon the inhabitants without diffinetion. The governor of Mawfel and Mesopotamia, being informed of these unparalleled outrages, marched against them with a body of troops, and carried on a brisk war with them for eight months. During this period their leader Nafe Ebn Al Azarak died; and was fucceeded by Katri Ebn Al Fojat, under whose conduct they continued their depredations. Musab not being pleafed with his lieutenant's management of the war, recalled him, and fent in his place one Omar Ebn . Abdallah Temini, who gave the Azarakites a great overthrow at Naisabur in Khorasan, put many of them to the fword, and purfued the rest as far as Ispahan

and the province of Kerman. Here having received They are a reinforcement, they returned into the province of defeated Ahwaz, and did incredible damage to the country and dispers-

through ed.

Barbarity

of Abdal-

malec.

Arabia. through which they passed. But Omar advancing against them a second time, they retired at his approach to Al Madayen, ravaging the district belonging to the city in a dreadful manner. However, Omar purfuing them thither also, they fled into the province of Kerman, and thence gradually dispersed themselves. This year there was a grievous famine in Syria, which

fuspended all military operations. The next year, being the 69th of the Hegira, Abdalmalec left Damascus to march against Musab. In his absence he left Amru Ebn Said governor of the city; but he immediately seized upon it for himself, which obliged the caliph to return. After feveral skirmishes had happened between some detachments of the caliph's troops with those of Amru, a pacification was concluded at the intercession of the women: but Abdalmalec barbarously put Amru to death with his own hand, notwithstanding his promise; and was immediately seized with such a tremor, that he lost the use of almost all his faculties, and was obliged to be laid in bed. In the mean time the palace was attacked by Yahyah, Amru's brother, at the head of 1000 slaves. After a warm dispute, they forced open the gates, killed several of the guards, and were upon the point of entering the palace, when the people within threw Amru's head among them. This fo cooled their ardour, that they defisted from the attempt; and some money having been afterwards distributed among them, they retired. So great, however, was Abdalmalec's avarice, that after the tumult was appealed, he recalled all the money which had been distributed, and commanded it to be deposited in the public treasury.

Difgrace-In the 70th year of the Hegira, the Greeks made an irruption into Syria; and Abdalmalec having occafion for all his forces to act against Abdallah Ebn Zoheir, was obliged to pay a tribute of 1000 dinars per day, according to Theophanes, and fend every year 365 flaves and as many horses to Constantinople. In this treaty, it was also stipulated, that the revenues of Cyprus, Armenia, and Heria, should be equally divid-

Mufab defeated and killed by Abdalma-

146

ful treaty

with the

Grecks.

ed between the caliph and the Greek emperor. Abdalmalec being now at leifure to purfue his intended expedition against Musab, marched against him in person; and having arrived at Masken, a small town on the frontiers of Melopotamia, where he was waited for by Musab, the latter was defeated through the treachery of his troops, and himself killed. After the battle, Abdalmalec repaired to Cufa, where he was received with the utmost submission; and people of all ranks came in crowds to take the oath of allegiance to him. He then ordered vast sums of money to be diftributed among them, and gave a splendid entertainment to his new subjects, to which even the meanest of them were not refused admittance. During this entertainment, the unfortunate Musab's head was presented to the caliph; upon which one of the company took Succasion to say to him, " I saw Hosein's head in this fame castle presented to Obeidallah; Obeidallah's to Al Mokhtar; Al Mokhtar's to Musab; and now at last Musab's to yourself." This observation so affected the williph, that, either to avert the ill omen, or from fome , other motive, he ordered the eastle to be immediately demolished. Abdallah Ebn Zobeir, in the mean time, maving received the melancholy news of the defeat and death of his brother, assembled the people of Mecca, and from the pulpit made a speech suitable to the oc- Arabia. casion. He also did his utmost to put Mecca in a proper posture of defence, expecting a speedy visit from his formidable competitor, who now gave law to Irak, Syria, and Egypt, without controul.

Soon after Abdalmalec's return to Damascus, he appointed his brother Bashar governor of Cufa, and Khaled Ebn Abdallah governor of Bafra. The latter had no fooner entered upon his office, than he indifcreetly removed from the command of the army Al Mohalleb, one of the greatest generals of the age; appointing in his room Abdalaziz, who was greatly his inferior in military skill. Of this dismission the Azarakites being informed, they immediately attacked Abdalaziz, entirely defeated him, and took his wife prisoner. A dispute arising among the victors about the price of that lady, one of them, to end it, immediately cut off her head. Upon this disafter, Khaled was commanded to replace Al Mohalleb, which he did; and having in conjunction with him attacked the Azarakites, forced Azarakites

their camp, and entirely defeated them.

" In the 72d year of the Hegira, Abdalmalec having no enemy to contend with but Abdallah Ebn Zobeir, made great preparations for an invasion of Hejaz, giving the command of the army to be employed on this occasion to Al Hejaj, one of his most warlike and eloquent captains. Before that general had put his army in march for Mecca, he offered his protection to all the Arabs there that would accept of it. Abdallah being informed of the enemy's approach, fent out feveral parties of horse, to reconnoited and give him intelligence of their motions. Between the states and some of Al Hejaj's advanced guards several states the mappened, in which Abdallah's men had generally the work. This encouraged Al Hejaj to send to the caliple at respective to the caliple at the second states. forcement, his troops amounting to no more than 2000 men, who were infufficient for reducing Mecca. & He affured him at the same time, that Abdallah's fierceness was very much abated, and that his men deferted to him daily. The caliph, upon this, ordered a reinforcement of 5000 men under the command of Tharik Ebn Amer; but notwithstanding this additional strength, Mecca behe made but little progress in the siege for sometime. sieged by While he battered the temple of Mecca with his ma-Al Hejaj. chines, it thundered and lightened fo dreadfully, that the Syrians were struck with terror, and refused to play them any longer upon that edifice. Upon this Al Hejaj stuck the corner of his vest into his girdle, and putting into it one of the stones that was to be discharged out of the catapults, slang it into the town, and this occasioned the recommencement of the operations. The next morning the Syrians were anoyed by fresh storms, which killed 12 men, and quite dispirited them. Al Hejaj, however, animated them, by observing that he was a fon of Tehama; that this was the storm of Tehama, and that their adversaries suffered as much as they. The day following fome of Abdallah's men were killed by a very violent storm, which gave Al Hejaj a further opportunity of animating his troops. At last, Abdallah having been deferted by most of his friends, 10,000 of the inhabitants of Mecca, and even by his own fons Hamza and Khobeib, defired to know his mother's fentiments as to what course he was to take. He represented to her, that he was almost entirely abandoned by his subjects and relations; that the few

Abdallah

killed.

Arabia. who perfifted in their fidelity to him could scarce enable him to defend the city any longer; and that the Syrian caliph would grant him any terms he should think fit to demand. His mother, however, being of an inflexible refolution, and not able to bear the thoughts of feeing her fon reduced to the rank of a private perfon, being herself the daughter of Abu Becr, the first caliph, advised him by no means to survive the sovereignty, of which he was on the point of being deprived. This advice being agreeable to his own fentiments, he refolved to die in defence of the place. In purfuance of this resolution, he defended the city, to the amazement of the beliegers, for ten days, though deftitute of arms, troops, and fortifications. At last, having taken a final leave of his mother, and being animated by despair, he made a fally upon the enemy, destroyed a great number of them with his own hand, and was at length killed fighting valiantly upon the fpot. At the last interview he had with his mother, she is said to have defired him to put off a coat of mail he had on for his defence; and, in order to inspire him with the greater fortitude, she gave him a draught in which a whole pound of musk had been insused. Al Hejaj ordered his head to be cut off, and his body to be affixed to a crofs; and by reason of the musk he had drank, the body emitted a grateful odour for several days.

By the reduction of Mecca, and the death of Abdallah Ebn Zobeir, Abdalmalec remained sole master of the Moslem empire; but he sustained a great loss next year, in having an army of 100,000 men totally cut off by the Khazarians in Armenia. The governor, however, having marched in person against them at the head of any topoo men, but all chosen troops, Khazarians penetrated into the heart of Armenia, defeated and difperiod large body of the Khazarians, drove them into their temples, and reduced them to ashes. One of his generals also defeated an army of 80,000 Khazarians at the Iron or Caspian Gates, and destroyed a great number of them, obliging the rest to embrace the Ma-

hometan religion.

Vol. II. Part I.

152 Crucky of Al Hejaj.

reduced.

Al Hejaj, in consequence of his services, was made governor, first of Medina, and then of Irak, Khorasan, and life tan; in all which places he behaved with the greatest cruelty. Having entered the city of Cufa muffled up in his turban, he was furrounded by crowds of people who pressed forward to see him. He told them their cariofity would foon be gratified; which he effectually did, by ascending the pulpit, and treating them in a very coarfe manner; fwearing that he would make the wicked bear his own burden, and fit him with his own shoe; and telling them, among other things, that "he imagined he saw the heads of men ripe and ready to be gathered, and turbans and beards besprinkled with blood." At Basra he made a speech much to the same purpose; and, to give the inhabitants a tafte of his discipline, caused one of them who had been informed against as a rebel to be beheaded on the spot without any trial. So great indeed was the abhorrence in which he was held by those over whom he prefided, that having once recommended himself to the prayers of a religious Moslem, the latter instantly prayed that it would please God to kill Al Hejaj quickly; "for nothing, said he, could be more advantageous for himfelf or the people." In confequence of these cruclties, rebellions were soon raised

against him; but they were easily suppressed, and Al Arabia Hejaj continued in the full enjoyment of all his employments till he died.

In the 76th year of the Hegira, one Saleh Ebn Marj, Saleh and a hot-headed enthusiast, and Shebib Ebn Zeid, a Kha-Shebib rerejite, took up arms against the caliph. They had con-bel. spired against him the year before when on a pilgrimage to Mecca; and Al Hejaj had been ordered to seize them: but at that time they found means to make their escape; and having now affembled about 120 men, Saleh was proclaimed emperor of the faithful at Daras in Melopotamia. The governor foon received intelligence of their motions; and ordered a body of 500 men, under the command of one Adi, to march against them: but that general, being afraid to attack them notwithstanding his superiority in numbers, demanded a reinforce-He therefore was supplied with 500 more ment. troops, with which he advanced to Daras: but being still afraid of the rebels, he entered into negotiations with them; during which they attacked him, entirely defeated his army, and made themselves masters of his camp. Upon this the governor fent a detachment of The r branch 1500 horse against them; but the rebels, notwith-very. standing the smallness of their number, defended themfelves in fuch a manner, that the caliph's troops were forced to difmount and fight on foot. The engagement continued till night; when the rebels, finding themselves unable to contend with such numbers, retired to Mawfel. After this, Al Hejaj being informed that they had taken post at Dascara, sent against them an army of 5000 men. The rebels, hearing of this formidable army, abandoned their camp; but were fo closely pursued, that they found themselves obliged to stand an engagement at Modbaj, a small village on the Tigris. Saleh's forces, confifting only of three com-Saleh killed panies of 30 men each, were foon thrown into diforder, and himself killed: but Shebib made an excellent retreat to a neighbouring castle; from whence he sallied out at midnight on the caliph's forces, penetrated to the very heart of the camp, where he wounded the general himself, and dispersed the greatest part of his army.

After this victory, the rebels became terrible even Allicia to Al Hejaj himself, whom they afterwards defeated in defeated by feveral engagements; and taking advantage of his be-Shebib. ing at Bafra, made themselves masters of Cufa with little opposition. Al Hejaj was now contramed to write to the caliph for a strong detachment of the Syrian troops, with which he advanced against Shebib; whose army bearing no proportion to that of Al Hejaj the former was totally defeated, had his wife's brother killed in the action, and was obliged to fly into Kerman. Having refreshed his men in this province, he again advanced to Ahwaz, where he was met by one of Al Hejaj's generals at the head of the Syrian army. Shebib defended himself with incredible valour, and Shebib's several times repulsed the caliph's forces; but being valour and overpowered by numbers, as his army confilted of no death. more than 600 men, he was at last put to slight, and, in passing a bridge, was thrown off by his horse and drowned. His body was drawn up by a net, and the head sent to Al Hejaj, who was not a little pleased at the fight. After his death, the rebels quarrelled among themselves, so that the caliph's troops cut off the greatest part of them. The remainder, under Katri Ebn Fojat, fled to Tabrestan. Here they were kind-

158 Ingratitude of the rebels.

159 They are

Arabia. ly received by Ashid the king, who assigned them a part of his territories for their habitation. But they had not been long fettled before they infifted upon Ashid's either embracing Mahometanism, or paying them an annual tribute; which he refusing, they drove him into Irak, where he implored the caliph's protection. Ashid afterwards conducted a body of Moslem troops into Tabrestan; where they fell upon the rebels with fach fury, that they killed Katri himfelf, cut a great number of his men to pieces, and took all the rell pri-

This year also (the 76th of the Hegira) money was first coined in Arabia. Besides this time, the dinars, or gold coins, had Greek infcriptions; and the duhems, or filver ones, Perfic inferiptions. The first erection of a mint in Arabia was occasioned by the following accident. Abdalmalee added to the letters he wrote to the Greek emperor this short passage of the Koran, "Say, God is one;" or "Say, there is one God;" and then inferted the year of the Hegira, with the name of the prophet, in fuch a manner as gave the emperor great offence. Upon this he wrote to Abdalmalec, defiring him to alter that manner of writing, or he would find him fome coins in which the name Money first of Mahomet should be mentioned in such a manuer as would not prove very agreeable. Abdalmalec now refolved to coin money of his own; and accordingly fome dishems were this year stamped by Al Hejaj, with the interaction Alla Samad, "God is eternal;" which gave great offence to the fuperflitious Moslems, as they imagined that the name of God would be thereby profaned by the touch of unclean persons.

In the 77th year of the Hegira, the Arabs made an incursion into the imperial territories, and had Lazica and Bernucium betrayed to them; and the next year they made themselves masters of Africa Propria, demolishing the city of Carthage so effectually, that scarce a veftige of it was left. They were foon driven out, however, by John the Patrician, a man of great valour and experience in war; but returning with a fuperior force, they obliged John in his turn to fly to Constantinople.

The 79th year of the Hegira is remarkable for nothing but the rebellion of Abdalrahman in Persia; who drove the Khakan, or emperor of the Turks, Tartars, or Moguls, out of that country: but the following year, one of the Greek generals, named Heraclius, penetrated into Syria as far as Samofata, and destroyed 200,000 A-200,000 Arabs, ravaging the country in a terrible manner; and Abdalrahman was defeated and killed by Al Hejaj, after a great number of engagements, some say 81, and others 100. In the 83d year of the Hegira, the nobility of Armenia revolting, drove the Arabs out of that province; but Mahomet, one of the caliph's generals, entering the country with a powerful army, got the authors of the revolt into his hands, and caused them all to be burnt alive. Encouraged by this fuccess, the Moslems invaded Cilicia under one Azar; but were, to the number of 10,000, cut in pieces by Heraclius; and the next year, having again entered that country, 12,000 of them were destroyed by the same general, and the rest forced to fly irto their own country.

In the 86th year of the Hegira died the caliph Abdalmalee, after a reign of 21 years. He is faid to have had fuch a stinking breath, that the slies which Arabia. accidentally fettled on his lips were almost instantly struck dead by it. He was succeeded by Al Walid, who greatly extended the Moslem dominions. The first year of his reign, one of his generals having passed the Oxus (now the Jihun), defeated a numerous army of Turks and Tartars. He then overran and entirely reduced the countries of Sogd or Sogdiana, Bagrafs, Shafh, Targana, and the whole immense tract going under the name of Mawaralnahr, or Great Bukharia. He also conquered the khan of Khowarazm, obliging Prodigious him to pay an annual tribute of two millions of dinars, conquells About the same time another general, called Mahomet, of the Mosmade an irruption into India, and fubdued a confider-lems. able part of that country. He also entirely subdued the kingdom of Al Sind, lying between Perlia and India. In this expedition, Derar king of Al Sind was defeated and killed, and had his head cut off by Mahomet.

In the 90th year of the Hegira, the Moslems made an irruption into Cappadocia, defeated the emperor's army who opposed them, and took the city of Tyana. The next year they made another incursion into the imperial territories, whence they carried off vast numbers of flaves; and the year following one Othman penetrated into the heart of Cilicia, where he made himfelf mafter of feveral cities, but does not appear to have long

kept his conquests.

In the 93d year of the Hegira, answering to that They make of Christ 712, Tarik Ebn Zarka made a descent in a descent Spain, defeated Roderio the lan king of the Goths, reon Spain,

fully gating in a manner the whole the confiderable and overging it to pay tribute to the caliph. In the capadiarun the
tions the Molems acquired fools of immense value, whole tions the Moslems acquired spoils of immense value; whole country. and, amongst other things, an exceeding rich table, called by the Arab writers " the table of Solomon the fon of David." According to these writers, this table confilted entirely of sale and filver, and was adorned with three borders of pearle; but Roderic of Toledo, a Spanish historian, says it consisted of one entire tone, of a green colour, and of an immense fize, having no less than 365 feet. He adds, that it was found in a certain village or town, near the mountain called in his days Jibal Soliman, or "the mountain of Solomon."

After Musa and Tarik had committed dreadful depredations in Spain, they were both recalled by the caliph; but the next year, Tarik having undertaken another expedition into the fame country, landed a body of 12,000 men at Gibraltar, with which he plundered the whole province of Bætica, and overran the greatest part of Lusitania. Roderic hearing of these depredations, fent against him an army of raw undisciplined troops, who were eafily defeated, and most of them left dead on the fpot; which so animated the Arab commander, that he refolved not to lay down his arms till he had made an absolute conquest of Spain. About the fame time that Tarik made fuch progress in Spain, another Moslem general entered Pisidia with a powerful army, took the city of Antioch, and, after having ravaged the country, retired into the caliph's territories with very little loss.

167 Al Hejaj ius.

In the 95th year of the Hegira died Al Hejaj governor of Irak, &c. after he had prefided over that country 20 years. He exercised such cruelties upon those who were in subjection to him, that he is said to have killed 120,000 men, and to have suffered 50,000 men and 30,000 women to perish in prison. To excuse this cruelty, he used frequently to say, That a fevere, or even violent government, is better that one too weak and indulgent; as the first only hurts particular persons, but the latter the whole community. This year also the Arabs gained a complete victory in Spain over Roderic king of the Goths, who perished in the action. In this campaign, Tarik possessed himself of immense treasures; by which means he was enabled to reward not only his officers, but common foldiers also. In the eastern parts of the world also, the Arabs were this year very formidable; Moslema, an Arab general, having entered the imperial territories, ravaged the whole province of Galatia, carrying off with him many rich spoils, and a vast number of prisoners. The Greek emperor, hearing that Al Walid defigned to attack him both by fea and land, fent fome of his bles to treat of a peace; and, among other things, defired them to bring him a particular account of the force with which the caliph defigned to invade the Greek empire. This they represented as so terrible, that it would be next to impossible to oppose it. The emperor therefore caused a great number of light ships to be built, the walls to be repaired, and ordered such of the citizens as he walls to be repaired, and ordered such of the citizens as he walls to be repaired, and ordered such of the citizens as he walls to be repaired, and ordered such of the utmost of the utmost vigour, being the continued to the company of the Hegira died the caliph Al

dies, and is Walti's and was succeeded by his brother Soliman. This year the Moslem conquests on the east side were increased by the reduction of Tabrestan and Jurgan or Georgia. In Spain, also, the city of Toledo which had revolted was reduced, and Carlarea Augusta, now Saragossa, as well as seven sources. The next year Constantin-Moslema set out for Constantinople, which he besieged ople unfuc- without success till the 99th year of the Hegira; at which time he was obliged to return, after having loft before it 120,000 men. The foldiers were reduced to the greatest extremities of hunger, being forced to live upon hides, the roots and bark of trees, the most noifome animals, and even the dead bodies of their com- . panions. This year also (the 99th of the Hegira) is remarkable for the death of the caliph Soliman. According to some, he was poisoned by Yezid his brother, governor of Perlia, who was displeased with his having appointed his coufin-german, Omar Ebn Abdalaziz, as his fuccesfor, to the exclusion of himself. According to others, he died of an indigestion; which is not greatly to be wondered at, if, as those authors fay, he used to devour 100 pounds weight of meat every day, and dine very heartily after eating three lambs roafted for breakfast. In the latter part of his reign, the Moslems were by no meas tuccefsful in Spain: the kingdom of Navarre being founded at this time by Pelagius, or Pelayo, whom the Arabs were never able to

The new caliph Omar Ebn Abdalaziz was by no means of a martial character; but is faid to have been

very pious, and possessed of very amiable qualities. He Atabia suppressed the usual malediction, which was folcomly pronounced by the calipha of the house of Ommiyah against the house of Ali; and always showed great kindness to the latter. He was poisoned by Yezid, after a New calit short reign of two years and five months. It is relat-poiloned. ed, as an instance of this caliph's humility, that when Moslema visited him in his last sickness occasioned by the poison, he lay upon a bed of palm tree leaves, supported by a pillow formed of bealts skins, and covered with an ordinary garment. He had also on a dirty shirt; for which Moslema blamed his fister Fatima, Omar's wife; but the excused herself by telling him, that the emperor of the faithful had not another shirt to put

Concerning Yezid the fuccessor of Omar we find very little worth mentioning. He did not long enjoy the dignity he had so iniquitously purchased, dying after a reign of little more than four years. He died of grief for a favourite concubine named Hababab, who was accidentally choked by a large grape which fluck in her throat.

Yezid was succeeded by his brother Hesham, who afcended the throne in the 105th year of the Hegira. In the fecond and third year of his reign, feveral incursions were made into the imperial territories, but generally without success. In the 109th year of the Hegira, Moslema drove the Turks out of Armenia and The Tur Aderbijan, and again confined them within the Caspian deleated. gates. The next year he obliged them to take an oath that they should keep their own country; but this they foon violated, and were again driven back by Moslema. About this time also the Arabs, having passed the Pyrences, invaded France to the number of 400,000, in-France in cluding women and flaves, under the command of one vaded by Abdalrahman. Having advanced to Arles upon the the Arat Rhone, they defeated a large body of French that opposed them; and having also descated Count Eucli, they purfued him through feveral provinces, wasted the whole country with fire and fword, making themselves mafters of the city of Tours, most of which they reduced to ashes. Here, however, a stop was put to their devailations by Charles Martel; who, coming up with They ar them near the above-mentioned city, engaged them for utterly d feven days together, and at last gave them a total feated by overthrow. The French general made himfelf mafter Charles Martel. of all their baggage and riches; and Abdalrahman, with the shattered remains of his army, reached the frontiers of Spain with the utmost difficulty. The following year alfo, according to fome historians, the Arabs were overthrown at Illiberis, scarce any of them making their escape. To make amends for this bad fortune, however, the caliph's arms were successful against the Turks, who had again invaded some of the eaftern provinces.

In the 125th year of the Hegira died the caliph Hesham, after a reign of 19 years, seven months, and eleven days. He was succeeded by Al Walid II. who is represented as a man of a most dissolute life, and was affaffinated the following year on account of his profesfing Zendicism, a species of insidelity nearly resembling Sadducism. He was succeeded by Yezid the son of Al Walid I. who died of the plague, after a reign of fix months; and was succeeded by Ibrahim Ebn 🗥 Walid, an imprudent and stupid prince. He was depart-

175

Reign of

Merwan.

Arabia ed in the 127th year of the Hegira by Merwan Ebn Mahomet, the governor of Mesopotamia; who gave out as an excuse for his revolt, that he intended to revenge the murder of the caliph Al Walid II. He was no fooner feated on the throne, than the people of Hems rebelled against him. Against them the caliph marched with a powerful army; and asking them what could excite them to this rebellion, fummoned them to furrender. They affured him that they were disposed to admit him into their city; and, accordingly, one of the gates being opened, Merwan entered with about 300 of his troops. The men that entered with him were immediately put to the fword; and the caliph himself escaped with great difficulty. However, he afterwards defeated them in a pitched battle, put a great number of them to the fword, difmantled the city, and crucified 600 of the principal authors of the revolt.

> This, however, was far from quieting the commotions in different parts of the empire. The inhabitants of Damaseus soon followed the example of those of Hems, and deposed the caliph's governor; but Merwan, immediately after the extinction of the former rebellion, marched to Damaseus with great celerity, entered the city by force, and brought to condign punishment the authors of the revolt. Peace, however, was no fooner established at Damascus, than Soliman Ebn Hesham fet up for himfelf at Bafra, where he was proclaimed caliph by the inhabitants. Here he affembled an army of 10,000 men, with whom he marched to Kinnistin, where he was joined by vast numbers of Syrians who flocked to him from all parts. Merwan, receiving advice of Soliman's rapid progress, marched against him with all the forces he could affemble, and entirely defeated him. In this engagement Soliman loft 30,000 men; fo that he was obliged to fly to Hems, where 900 men took an oath to stand by him to the last. Having ventured, however, to attack the caliph's forces a fecond time, he was defeated, and again forced to fly to Hems. But being closely purfued by Merwan, he conflituted his brother Said governor of the city, leaving with him the shattered remains of his troops, and himself sled to Tadmor. Soon after his departure Merwan appeared before the town, which he befieged for feven months; during which time he battered it incessantly with 80 catapults. The citizens, being reduced to the last extremity, furrendered, and delivered Said into the caliph's hands. In confideration of this fubmiffion, Merwan pardoned the rebels, and took them all under his protection. About the fame time, another pretender to the caliphate appeared at Cufa; but Merwau took his measures so well, that he extinguished this rebellion before it could come to any height.

> Notwithstanding the success, however, that had hitherto attended Merwan, a strong party was formed against him in Khorafan by the house of Al Abbas. The first of that house that made any considerable sigure was named Mahomet, who flourished in the reign of Omar Ebn Abdalaziz. He was appointed chief of the house of Al Abbas about the hundredth year of the *Elegira; and is faid to have prophelied, that after his meath, one of his fons, named Ibrahim, should preside over them till he was killed, and that his other fon Abdellah, furnamed Abul Abbas Al Saffah, should be ca-Moh, and exterminate the house of Ommiyah. Upon

this Al Saffali was introduced as the future fovereign, Arabia. and those present kissed his hands and feet.

After the decease of Mahomet, his fon Ibrahim nominated as his representative in Khorasan one Abu Moslem, a youth of 19 years of age; who beginning to raife forces in that province, Merwan despatched against him a body of horse under the command of Nasr Ebn Sayer; but that general was entirely defeated by Merwan's Abu Moslem, and the greatest part of his men killed. forces de-The next year (the 128th of the Hegira) Merwan feated. made vast preparations to oppose Abu Moslem, who after the late victory began to grow formidable to feveral parts of the empire. According to some authors, Merwan gained two victories over some of Ibrahim's generals; but the year following, Abu Moslem brought fuch a formidable army into the field, that the caliph's troops could not make head against them; his officers in Khorasan therefore were obliged either to take an oath of allegiance to Ibrahim, or to quit the province within a limited time.

In the 130th year of the Hegira, the caliph's gencral Nafr having drawn together another army, was again defeated by Kahtaba another of Ibrahim's generals, and forced to fly to Raya, a town of Dylam, according to fome, or of Khorusan, according to others. 178 The next year Ibrahim having foolifhly taken it into to death. his head to go on a pilgrimage to Mecca, attended by a numerous retinue splendidly accoutred, was seized and put to death by Merwan; and the year following Abul Abbas was proclaimed caliph at Cufa. As foon as the ceremony was ended. He fent his uncle Abdallah with a powerful army to attack Merwan's forces that were encamped near Tubar at a fatall distance from Moful, where that caliph was then whiting for an account of the success of his troops under Yezid governor of Irak, against Khataba one of Al Saffah's gene-Khataba receiving advice of Yezid's approach, immediately advanced against him, and entirely defeated him; but in croffing the Euphrates, the waters of which were greatly fwelled, he was carried away by the current and drowned? The pursuit, however, was continued by his fon Hamid, who dispersed the fugitives in such a manner that they could never afterwards be rallied. At the news of this difaster, Merwan was at first greatly dispirited; but soon recovering himself, 179 he advanced to meet Abdallah. In the beginning of himself dethe battle, the caliph happened to difmount; and his feated, troops perceiving their fovereign's horse without his rider, concluded that he was killed, and therefore immediately fled; nor was it in the power of the caliph himself to rally them again, so that he was forced to fly to Damascus: but the inhabitants of that city, seeing his condition desperate, shut their gates against him. Upon this he fled to Egypt, where he maintained himfelf for some time; but was at last attacked and killed and killed. by Salch, Abdallah's brother, in a town of Thebais, called Bufir Kurides. The citizens of Damascus, though they had shamefully deserted Merwan, resused to open their gates to the victors; upon which Salch entered the city by force, and gave it up to be plundered for three days by his foldiers.

By the total defeat and death of Merwan, Al Saffah remained fole mafter of the Moslem throne; but we hear of no very remarkable events that happened during

braned aink him

176

Arabia. his reign: only that he massacred great numbers of the partifans of the house of Ommiyah; and that Constantine Copronymus, taking advantage of the intelline divitions among the Mollems, ravaged Syria. The

caliph died of the small pox in the 136th year of the Reign of Al Hegira, in the 33d year of his age; and was succeeded by his brother Al Manfur. In the beginning of Al Manfur's reign, hostilities continued against the house of Ommiyah, who still made resistance, but were always defeated. Abdallah, however, the caliph's uncle, caused himself to be proclaimed caliph at Damascus; and having affembled a powerful army in Arabia, Syria, and Mesopotamia, advanced with great expedition to the banks of the Masius near Nisibia, where he encamped. Al Manfur, being informed of this rebellion, despatched Abu Moslem against Abdallah. This general, having haraffed him for five months together, at last brought him to a general action; and having entirely defeated him, forced him to fly to Bafra. withstanding all his services, however, Abu Moslem was foon after ungratefully and barbaroufly murdered by Al Mansur, on some ridiculous pretences of being deficient in respect towards him.

pain-

After the death of Ahu Moslem, one Sinan a Magian, or adorer of fire, having made himself matter of that general's treasures, revolted against the caliph; but he was foon defeated by Jamhur Ebn Morad, who had been fent against him with a powerful army. In this expedition Jamhur having acquired immense riches, the covetous disposition of the caliph prompted him to send a person express to the army to seize upon all the wealth. This so provided Jamhur, that he immediately turned his arms grandt his master; but was soon defeated, and entirely reduced. The following year (the 139th of the Hegira'), one Abdalrahman, of the house of Ommiyah, after the entire ruin of that family in Afia, arrived in Spain, where he was acknowledged caliph; nor did he or his descendents ever afterwards own

the doctrine of metempsycholis or transmigration .-

he resolved to remove the capital of his empire out of Arabia. their peniafula; and accordingly founded a new city on the banks of the Tigris, which from that time to this 185 has been known by the name of Bagdad. The foun-the feat of dations of it were laid in the 145th year of the Hegira, empire to and finished four years after.

Pagdad.

On the removal of the feat of government to Bagdad, the peninfula of the Arabs feems all at once to have loft its consequence, and in a short time the inhabitants feem even to have detached themselves from the jurifdiction of the caliphs: for in the 156th year of the Hegira, while Al Mansur was yet living, they made irruptions into Syria and Mesopotamia, as if they had defigned to conquer these countries over again for themselves; and though the Arabs, properly so called, continued nominally subject to the caliphs of Bagdad till the abolition of the caliphate by Hulaku the Tartar, yet they did not become subject to him when he became master of that city. There is even the strongest reason to believe that the Arabs (i. c. the inhabitants of the peninfula properly called Arabia) have remained independent, not only of Hulaku, but of every other conqueror that the world hath yet produced.

their brethren. Yet these exceptions are temporary or local; the body of the nation has escaped the yoke of

the most powerful monarchies: the aims of Sesostris

and Cyrus, of Pompey and Trajan, could never a-

chieve the conquell of Arabia; the present sovereign

of the Turks may exercise a shadow of jurisdiction,

but his pride is reduced to solicit the friendship of a

people whom it is dangerous to provoke and fruitless to attack. The obvious causes of their freedom are

inferibed on the character and country of the Arabs.

Many ages before Mahomet, their intrepid valour had

been severely felt by their neighbours in offensive and defensive war. The patient and active virtues of a fol-

dier are infenfibly nurfed in the habits and discipline of a paftoral life. The care of the sheep and camels-

is abandoned to the women of the tribe; but the martial youth under the banner of the emir, is ever on

horseback, and in the field, to practise the exercise of

the bow, the javelin, and the feimitar. The long

memory of their independence is the firmest pledge of its perpetuity; and fucceeding generations are animated

to prove their descent and to maintain their inheri-

tance. Their domestic fends are suspended on the ap-

proach of a common enemy; and in their last hostili-

ties against the Turks, the caravan of Mecca was attacked and pillaged by fourfcore thousand of the con-

federates. When they advance to battle, the hope of

victory is in the front; and in the rear, the affurance of

a retreat. Their horses and camels, who in eight or

ten days can perform a march of four or five hundred

miles, disappear before the conqueror; the secret wa-

ters of the defert clude his fearch; and his victorious

troops are confumed with thirfy hunger, and fatigue,

The perpetual independence of the Arabs, indeed, Goldon's " has been the theme of praise among strangers and na- Hist. Vol. V tives. fubjection to the Arabian caliphs. 184 The 140th year of the Herrica is remarkable for an Attempt to attempt to affaifinate the califn. This attempt was made by the Rawandians; an impious feet, who held They first offered Al Mansur divine honours, by going in procession round his palace, as the Moslems were wont to do round the Caaba; but the caliph, highly incenfed at this impiety, ordered 100 of the principal of them to be imprisoned. These, however, were soon releafed by their companions; who then went in a body to the pulace with an intention to murder their fovereign: but he being a person of uncommon bravery, though he was surprised with very few attendants, mounted a mule, and advanced towards the mutineers, with an intention to fell his life as dear as possible. In the mean time, Maan Ebn Zaidat, one of the chiefs of the Ommiyan faction, who had concealed himfelf in order to avoid the caliph's refentment, fallied out of his retreat, and putting himfelf at the head of Al Manfur's attendants, charged the rebels with fuch fury, that he entirely defeated them. This generofity of Maan was so remarkable, that it afterwards passed into a proverb. 'On this occasion 6000 of the Rawandians were killed on the fpot, and the caliph delivered from instant death: he was, however, so much disgusted with the Arabs on account of this attempt, that

Arabia in the pursuit of an invisible foe, who scorns his efforts, and fafely repofes in the heart of the burning folitude. The arms and deferts of the Bedoweens are not only the fafeguards of their own freedom, but the barriers allo of the Happy Arabia, whose inhabitants, remote from war, are enervated by the luxury of the foil and The legions of Augustus melted away in difease and lassitude; and it is only by a naval power that the reduction of Yemen has been successfully attempted. When Mahomet erected his holy standard, that kingdom was a province of the Persian empire; yet feven princes of the Homerites still reigned in the mountains; and the vicegerent of Chofroes was tempted to forget his distant country and his unfortunate The historians of the age of Justinian reprefent the flate of the independent Arabs, who were divided by interest or affection in the long quarrel of the East: the tribe of Ghassan was allowed to encamp on the Syrian territory; the princes of Hira were permitted to form a city about forty miles to the fouthward of the ruins of Babylon. Their fervice in the field was speedy and vigorous; but their friendship was venal, their faith inconstant, their enmity capricious: it was an easier task to excite than to disarm these roving barbarians: and, in the familiar intercourse of war, they learned to fee, and to despise, the splendid weakness both of Rome and of Persia. From Mecca to the Euphrates, the Arabian tribes were confounded by the Greeks and Latins, under the general appellation of Saracens; a name which every Christian mouth has been taught to pronounce with terror and abhorrence.

187 Their domestic freedom and character.

"The flaves of domestic tyranny may vainly exult in their national independence; but the Arab is personally fice; and he enjoys, in some degree, the benefits of fociety, without forfeiting the prerogatives of nature. In every tribe, superstition, or gratitude, or fortune, has exalted a particular family above the heads of their equals. The dignities of sheich and emir invariably descend in this chosen race; but the order of fuccession is loose and precarious; and the most worthy or aged of the noble kinfmen are preferred to the fimple, though important, office of composing disputes by their advice, and guiding valour by their example. The momentary junction of feveral tribes produces an army: their more lasting union constitutes a nation; and the supreme chief, the emir of emirs, whose banner is displayed at their head, may deserve, in the eyes of strangers, the honours of the kingly name. If the Arabian princes abuse their power, they are quickly punished by the defertion of their subjects, who had been accustomed to a mild and parental jurisdiction. Their spirit is free, their steps are unconfined, the defert is open, and the tribes and families are held together by a mutual and voluntary compact. The fofter natives of Yemen supported the pomp and majesty of a monarch; but if he could not leave his palace without endangering his life, the active powers of government must have been devolved on his nobles and magistrates. The cities of Mecca and Medina present, in the heart of Asia, the form or rather the substance of a commonscalth. The grandfather of Mahomet, and his lineal ancellors, appear inforeign and domestic transactions as the rinces of their country; but they reigned like Pericles at thers, or the Medici at Florence, by the opinion of

their wildom and integrity; their influence was divided Arabia. with their patrimony; and the sceptre was transferred from the uncles of the prophettoa youngerbranch of the tribe of Koreish. On solemn occasions they convened the affembly of the people; and, fince mankind must be either compelled or perfuaded to obey, the use and reputation of oratory among the ancient Arabs is the clearoft evidence of public freedom. But their simple freedom was of a very different cast from the nice and artificial machinery of the Greek and Roman republics, in which each member possessed an undivided share of the civil and political rights of the community. In the more simple state of the Arabs, the nation is free, because each of her fons difdains a base submission to the will of a master. His breast is fortified with the austere virtues of courage, patience, and fobriety; the love of independence prompts him to exercise the habits of self-command; and the fear of dishonour guards him from the meaner apprehension of pain, of danger, and of death. The gravity and firmness of the mind is conspicuous in its outward demeanour: his speech is Mow, weighty, and concile; he is feldom provoked to laughter; his only gesture is that of stroaking his beard, the venerable fymbol of manhood; and the fenfe of his own importance teaches him to accost his equals without levity, and his superiors without awe. The liberty of the Saracens survived their conqueits: the first caliphs indulged the bold and familiar language of their fubjects: they ascended the pulpit to persuade and edify the congregation; now before the seat of empire was removed to the that the Abbassides adopted the proud and proper commonial of the Persian and Byzantine courts. 188
"In the study of nations and men, we may observe Civil ware

the causes that render them hostile of friendly to each and private other, that tend to narrow or enlarge, to mean or revenge. exasperate, the social character. The separation of the Arabs from the rest of mankind has accustomed them to confound the ideas of stranger and enemy: and the poverty of the and has introduced a maxim of jurisprudence, which they believe and practise to the present hour. They pretend, that in the division of the earth the rich and fertile climates were assigned to the other branches of the human family; and that the posterity of the outlaw Ismael might recover, by fraud or force, the portion of inheritance of which he had been unjustly deprived. According to the remark of Pliny, the Arabian tribes are equally addicted to theft and merchandife: the caravans that traverse the defert are ranfomed or pillaged; and their neighbours, fince the remote times of Job and Sefostris, have been the victims of their rapacious spirit. If a Bedoween discovers from afar a solitary traveller, he rides furioully against him, crying, with a loud voice, " Undress thyself; thy aunt, (my wife) is without a garment." A ready submission entitles him to mercy; resistance will provoke the aggressor, and his own blood must expiate the blood which he prefumes to shed in legitimate defence. A fingle robber, or a few affociates, are branded with their genuine name; but the exploits of a numerous band assume the character of lawful and honourable war. The temper of a people, thus armed against mankind, was doubly inflamed by the domestic license of rapine, murder, and revenge. In the constitution of Europe, the right of peace and war is

Arthia now confined to a small, and the actual excercise to a much smaller, list of respectable potentates; but each Arab, with impunity and renown, might point his javelin against the life of his countryman. The union of the nation conflited only in a vague refemblance of language and manners; and in each community the jurifdiction of the magistrate was mute and impotent. Of the time of ignorance which preceded Mahomet, 1700 battles are recorded by tradition; hostility was embittered with the rancour of civil faction; and the recital, in profe or verfe, of an obsolete feud was sufficient to rekindle the fame passions among the descendants of the hostile tribes. In private life, every man, at least every family, was the judge and avenger of its own cause. The nice sensibility of honour, which weighs the infult rather than the injury, sheds its deadly venom on the quarrels of the Arabs: the honour of their women, and of their beards, is most easily wounded; an indecent action, a contemptuous word, can be expiated only by the blood of the offender; and fuch is their patient inveteracy, that they expect whole months and years the opportunity of revenge. A fine or compensation for murder is familiar to the barbarians of every age: but in Arabia the kinfmen of the dead are at liberty to accept the atonement, or to exercise with their own hands the law of retaliation. The refined malice of the Arabs refuses even the head of the murderer, substitutes an innocent to the guilty person, and transfers the penalty to the best and most considerable of the race by whom they have been injured. If he falls by the hands, they are exposed in their turn to the danger the corifuls; the interest and principal of the blood debt are accumulated; the individuals of either tunity lead a life of malice and sufpicion, and 50 years may fometimes elapse before the actions of vengeance be finally fettled. This fangui-nary pirit, ignorant of pity or forgiveness, has been moderated, however, by the maxims of honour, which require in every private encounter some decent equality of age and strength, examiners and weapons. An annual festival of two haps of four months, was observed by the Arabs before the time of Mahomet; during which their swords were religiously sheathed both in foreign and domestic hostility; and this partial truce is more firongly expressive of the habits of anarchy and warfare.

190 Their focial qualifications

189

Annual

by the milder influence of trade and literature. solitary peninsula is encompassed by the most civilized and virtues nations of the ancient world: the merchant is the friend of mankind; and the annual caravans imported the first seeds of knowledge and politeness into the cities, and even the camps of the defert. The arts of grammar, of metre, and of rhetoric, were unknown to the freeborn eloquence of the Arabians; but their penetration was sharp, their fancy luxuriant, their wit throng and fententious, and their more elaborate compositions were addressed with energy and essect to the minds of their hearers. The genius and merit of a rifing poet was celebrated by the applause of his own and the kindred tribes. A folemn banquet was prepared, and a chorus of women, striking their cymbals, and displaying the pomp of their nuptials, fung in the prefence of their

fons and husbands the felicity of their native tribe;

"But the spirit of rapine and revenge was attempered

that a champion had row appeared to vindicate their Arabia. rights; that a herald had raifed his voice to immortalize their renown. The distant or hostile tribes resorted to an annual fair which was abolished by the fanaticism of the first Moslems; a national affembly that must have contributed to refine and harmonize the barbarians. Thirty days were employed in the exchange, not only of corn and wine, but of cloquence and poetry. The prize was disputed by the generous emulation of the bards; the victorious performance was deposited in the archives of princes and emirs; and we may read in our own language the feven original poems which were inscribed in letters of gold and suspended in the temple of Mecca. The Arabian poets were the historians and moralists of the age; and if they fympathized with the prejudices, they inspired and crowned the virtues of their countrymen-The indiffoluble union of generofity and valour was the darling theme of their fong; and when they pointed their keenest satire against a despicable race, they affirmed, in the bitternels of reproach, that the men knew not how to give, nor the women to deny. The same hospitality which was practifed by Abraham, and celebrated by Homer, is still renewed in the camps of the Arabs. The ferocious Bedoweens, the terror of the defert, embrace, without inquiry or helitation, the stranger who dares to conside in their honour and to enter their tent. His treatment is kind and refpectful: he shares the wealth or the poverty of his host; and, after a needful repose, he is dismissed on his way, with thanks, with bleffings, and perhaps with gifts.

"The religion of the Arabs, as well as of the Indians, Ancient confitted in the worship of the sun, the moon, and the idolatry, fixed flars; a primitive and specious mode of superstition. The bright luminaries of the sky display the visible image of a Deity: their number and distance convey to a philosophic, or even a vulgar eye, the idea of boundless space: the character of eternity is marked on these solid globes, that seem incapable of corruption or decay: the regularity of their motions may be ascribed to a principle of reason or instinct; and their real or imaginary influence encourages the vam belief that the earth and its inhabitants are the object of their peculiar care. The science of astronomy was cultivated at Babylon; but the school of the Arabs was a clear firmament and a naked plain. In their nocturnal marches, they fleered by the guidance of the flars: their names, and order, and daily flation, were familiar to the curiofity and devotion of the Bedoween; and he was taught by experience to divide in 28 parts the zodiac of the moon, and to blefs the constellations who refreshed, with salutary rained thirst of the desert. The reign of the heave could not be extended beyond the visible spin of some metaphysical powers were necessary to sustain the transmigration of fouls and the refurrection of bodies; a camel was left to perish on the grave, that he might ferve his mafter in another life; and the invocation of departed spirits implies that they were still endowed with consciousness and power. Each tribe, each family, each independent warrior, created and detect the rites and the object of his fantastic worship but the nation, in every age, has bowed to the religion as

well

191 Love of poetry.

Arabia well as to the language of Mecca. The genuine antiquity of the Caaba extends beyond the Christian era. In describing the coast of the Red sea, the Greek hi-The Caaba forian Diodorus has remarked between the Thaumaudites and the Sabzans, a famous temple, whose superior fanctity was revered by all the Arabians; the linen or filken veil, which is annually renewed by the Turkish emperor, was first offered by a pious king of the Homerites, who reigned 700 years before the time of Mahomet. A tent or a cavern might fuffice for the worship of the savages, but an edifice of stone and clay has been crected in its place; and the art and power of the monarchs of the east have been confined to the simplicity of the original model. A spacious portico encloses the quadrangle of the Caaba; a square chapel, 24 cubits long, 23 broad, and 27 high; a door and a window admit the light; the double roof is supported by three pillars of wood; a spout (now of gold) discharges the rain water, and the well Zemzem is protected by a dome from accidental pollution. The tribe of Koreith, by fraud or force, had acquired the custody of the 'Caaba: the facerdotal office devolved through four lineal descents to the grandfather of Mahomet; and the family of the Hashemites, from whence he sprung, was the most respectable and sacred in the eyes of their country. The precincts of Mecca enjoyed the rights of fanctuary; and, in the last month of each year, the city and the temple were crowded with a long train of pilgrims, who prefented their vows and offerings in the house of God. The same rites which are now accomplished by the faithful Mussulmen were invented and practifed by the superstition of the idolaters. At an awful distance they cast away their garments: feven times, with hafty fleps, they encircled the Caaba, and kissed the black stone; seven times they visited and adored the adjacent mountains; feven times they threw stones into the valley of Mina; and the pilgrimage was achieved, as at the present hour, by a facrifice of sheep and camels, and the burial of their hair and nails in the confecrated ground. Each tribe either found or introduced in the Caaba their domestic worship: the temple was adorned or defiled with 360 idols of men, eagles, lions, and antelopes; and most conspicuous was the statue of Hebal, of red agate, holding in his hand feven arrows, without heads or feathers, the instruments and symbols of profane divination. But this statue was a monument of Syrian arts; the devotion of the ruder ages was content with a pillar or a tablet; and the rocks of the defert were hewn into gods or altars, in imitation of the black stone of Mecca, which is deeply tainted with the reproach an idolatrous origin. From Japan to Peru, the fice has universally prevailed; and the vote of the his gratitude or fear by destroying or con in honour of the gods, the dearest and most precious of their gifts. The life of a man is the most precious oblation to deprecate a public calamity; the altars of Phoenicia and Egypt, of Rome and Carshage, have been polluted with human gore; the cruel ractice was long preserved among the Arabs; in the tribe de Dumatians; and a royal captive was pioully flanghtered by the prince of the Saracens, the ally and soldier of the emperor Justinian. The father

of Mahomet himself was devoted by a rash vow, and Araba. hardly ranfomed for the equivalent of 100 camels. The Arabs, like the Jews and Egyptians, abstained from the talle of swine's flesh; and they circumcifed their children at the age of puberty: the same customs, without the censure or the precept of the Koran, have been filently transmitted to their posterity and profelytes; and it has been fagaciously conjectured, that the artful legislator indulged the stubborn prejudices of his countrymen.

"Arabia was free: From the adjacent kingdoms, Introducwhich were shaken by the storms of conquest and ty-tion of the

rasmy, the perfecuted feets fied to the happy land where Sabiana they might profess what they thought, and practife what they professed; and the religions of the Sabians and Magians, of the Jews and Christians, were diffeminated from the Persian gulf to the Red sea. In a remote period of antiquity, Sabianism was diffused over Asia by the science of the Chaldeans and the arms of the Affyrians. From the observations of 2000 years, the priests and astronomers of Babylon deduced the eternal laws of nature and providence. They adored the seven gods or angels who directed the course of the feven planets, and fined their irrefistible influence on the earth. The attributes of the seven planets, with the twelve figns of the zodiac, and the twentyfour constellations of the northern and southern hemifphere, were represented by images and talismans; the feven days of the week were dedicated to their respective deities; the Sabians prayed thrice each day; and the temple of the moon at Haran was the term of their pilgrimage. But the desible essius of their faith 196 was always ready either to acach eithe learn. The al-The Magitars of Babylon were overturned by the Magians; but ans. the injuries of the Sabians were revenged by the fword of Alexander. Persia grouned about 500 years under a foreign voke; and the pureft disciples of Zorosfter escaped from the contagion of idolatry, and breathed with their adversaries the freedom of the defert. Se-The Jows. ven hundred years before the death of Mahomet the Jews were fettled in Arabia: and a far greater multitude was expelled from the holy land in the wars of Titus and Hadrian. The industrious exiles aspired to liberty and power: they erected fynagogues in the cities and castles in the wilderness; and their Gentile converts were confounded with the children of Ifrael, whom they refembled in the outward mark of circumcilion. The Christian missionaries were still more ac-The Chritive and successful: the Catholics afferted their univer-filana fal reign; the fects whom they oppressed successively retired beyond the limits of the Roman empire; the Marcionites and Manichanus dispersed their fantastic opinions and apocryphal gospels; the churches of Yemen, and the princes of Hira and Ghassan, were infiructed in a purer creed by the Jacobite and Nestorian bishops." Such was the state of religion in Arabia previous to the appearance of Mahomet. See No 22.

As the Arabs are one of the most ancient nations in the world, having inhabited the country they at present possess almost from the delage, without intermixing with other nations, or being subjugated by any foreign power, their language must have been formed foon after, if not at, the confusion of Babel. The two princi-

Sacrifices

and rites.

199

Arabia. pal dialects of it were, that spoken by the Hamyarites and other genuine Arabs, and that of the Koreish, in which Mahomet wrote the Koran. The first is styled by the Oriental writers the Arabic of Hamyor, and the other the pure or defecated. As Yarab, grandfather of Hamyar, is supposed by the Oriental writers to have been the first whose tongue deviated from the Syriac to the Arabic, the Hamyaritic dialect according to them must have approached nearer to the purity of the Syriac; and confequently have been more remote from the true genius of the Arabic than that of any other tribe. The dialect of the Koreish, termed by the Koran the perspicuous and clear Arabic, is referred to Ishmuel as its author; who, fay the above-mentioned writers, first fpoke it; and, as Dr Pococke believes, after he had contracted an alliance with the family of Jorham by marriage, formed it of their language and the original Hebrew. As, therefore, the Hamyaritic dialect partook principally of the Syriac, so that of the Koreish was supposed to consist chiefly of the Hebrew. But, according to Jallalo'ddin, the politeness and elegance of the dialect of the Koreish ought rather to be attributed to their having, from the remotest antiquity, the custody of the Caaba, and dwelling in Mecca the centre of Arabia. The Arabs are full of the commendations of their language, which is very harmonious, expressive, and, as they say, so immensely copious, that no man uninspired can be a perfect matter of it in its utmost extent. How much, in this last article, it is fuperior to the Greek and Latin tongues, in some measure appears from hence, that sometimes a bare enumeration of the Armet names one particular thing, and an emication of them, will make a confiderable volume. Notwithstanding this, the Arabs believe the greatest part of their language to be lost; which will not feem improbable, when we confider how late the art of writing became generally practifed among them. For though it was known to Job their countryman, to the Edomites, as well as the other Arabian nations bordering upon Egypt and Phænicia, and to the Hamyarites many conturies before Mahomet, as appears from some ancient monuments said to be remaining in their character; yet the other Arabs, and thole of Mecea in particular, unless such of them as were either Jews or Christians, were to the time of Moramer perfectly ignorant of it. It was the ancient Arabic language preceding the reign of Justinian, which so nearly resembled the Ethiopic; for fince that time, and especially since the age of Mahomet, all the Arabic dialects have been not a little corrupted. This is now the learned language of the Mahometans, who study it as the European Christians do the Hebrew, Greek, and

The character used by them, the most ancient of any peculiar to the Arabs, wherein the letters were not distinctly separate, went by the appellation of Al Mosnad, from the mutual dependency of its letters or parts upon one another. This was neither publicly taught, nor fuffered to be used, without permission first obtained. Could we depend upon what Al Fira 1zabadius relates from Ebn Hashens, this character must have been of a very high antiquity; fince an infeription in it, according to the last author, was found in Yaman as old as the time of Joseph. Be that as it will, Moramer Ebn Morra of Anbar, a city of Irak, who lived not Vol. II. Part I.

many years before Mahamet, was the inventor of the Arabia. present Arabic character, which Bashar the Kendian, who married the fifter of Abu Sofian, is faid to have learned from the house of Anbar, and to have introduced at Mecca but a little time before the inflitution of Mahometism. Moramer's alphabet the Oriental authors agree to have been very different from the ancient one of the Hamyarites, fince they diflinguish the Hamyaritic and Arabic pens. In Mahomet's time, the Morameric alphabet had made so small a progress, that no one in Yaman could either write or read it; nay, Mahomet himself was incapable of doing either; for which reason he was called the illiterate prophet. The letters of this alphabet were very rude; being either the same with, or very much like, the Cufic; which character is fill found in inscriptions and the titles of ancient books; nay, for many years, it was the only one used by the Arabs, the Koran itself being at first written therein. In order to perpetuate the memory of Moramer's invention, some authors call the Arabic letters al Moramer, i. e. the progeny of Moramer. The most remarkable specimens of the Cufic character (so denominated from Cufa, a city of Irak, where some of the first copies of the Koran were written) are the following: Part of that book in it on vellum, brought from Egypt by Mr Greaves; fome other fragments of the same book in it published by Sir John Chardin; certain passages of a MS. in the Bodleian library; the legends on feveral Saracenic coins dug up not many years ago on the coast of the Baltic, not far from Dautzick; and, according to Mr Professor Hunt, those noble remains of it that are, or were lately, to be feen in Mr Joseph Ames's valuable collection of antique curiofities. As to the true origin of the ancient and modern Arabic alphabets, we must own ourselves pretty much in the dark. Sec ALPHABET.

The Arabian learning may be divided into two per Learnings riods, viz. Ante-Mahometan and Mahometan.

The Arab learning, in this first period, confisted, according to Abulpharagius, in the knowledge of their language, the propriety of discourse, the compusition of verse, and the science of the slars: but their chief attention feems to have been directed to oratory and poetry.

The second period is more distinguished, at least from the time of Al-Mamon, the feventh caliph of the family of the Abassides, who slourished about the year 820, and has the honour of being the founder of the modern Arabian learning. He fent for all the best books out of Chaldea, Greece, Egypt, and Perlia, relating to phylic, altronomy, cosmography, music, chronology, &c. and pentioned a number of learned men, skilled in the several languages and sciences to translate them into Arabic. By this means, divers of the Greek authors, loft in their own country and language, have been preserved in Arabic. From that time Arabia became the chief feat of learning; and we find mention by Ahulpharagius, Pococke, D'Herbelot, and Hottinger, of learned men, and books without num-

The revival of learning in the tenth century, by Gerbert, known after his elevation to the pontificate by the title of Silvester II. and afterwards among the Europeans in general, may be ascribed to the instructions and writings of the Arabian doctors and philosophers,

Arabia and to the schools which they founded in several parts of Spain and Italy. And in the 12th century, the inquisitive of different countries frequented the schools of the Saracens in Spain, and diffeminated the knowledge which they obtained there after their return. At this time, many of the learned productions of the Arabians were translated into Latin, which facilitated the general progress of science.

The philosophy of the Arabians, before Mahomet, was Sabian, and included the fystem and ceremonies of that feet of idolaters. This it was that Mahomet fet himself to decry; and he is even said by some to have carried his opposition so far, as to prohibit, if not punish, all study of philosophy. But his followers, by degrees, got over this restraint; the love of learning increased; till, under the memorable caliphate of Al Mamon, Arittotle's philosophy was introduced and established among them; and from them propagated, with their conquells, through Egypt, Africa, Spain, and other parts. As they chose Aristotle for their mafter, they chiefly applied themselves to that part of philosophy called logic, and thus became proficients in the knowledge of words rather than things. Whence they have been fometimes denominated Masters of the wildom of words; fometimes the Talking feet. Their philosophy was involved in quaint arbitrary terms and notions, and their demonstrations drawn from thence as from certain principles, &c. Walch Hift. Log. Lib. II.

Their physic succeeded the Grecian; and their phyficians handed down the art to us, having made confidetable improvements, chiefly in the pharmaceutical

and chemical parts.

It is certain we owe to them most of our spices and aromatics, as natmegs, cloves, mace, and other matters of the produce of India. We may add, that most of the gentler purgatives were unknown to the Greeks, and first introduced by the Araba, as manna, senna, rhubarb, tamarend's, cuffia, &c. They likewife brought fugar into use in physic, where, before, only honey was used. They also found the art of preparing waters and oils, of divers simples, by distribution and sublimation. The feel not ex of the fmallpox and the meeff-s is likewife owing to them. Laftly, The restoration of physic in Europe took its rife from their writings. M. le Clerc has given a sketch, and Dr Freind an ample loftory, of the Arabian physic. We have also a Notitia of all the Arabian physicians by Fa-

Their poetry may be divided into two ages. The ancient, according to Voffius, was no other than rhyming; was a stranger to all measure and rule; the verfes loofe irregular, confined to no feet, number of fyllables, for any thing elfe, fo that they rhymed at the end: oftentimes all the verfes in the poem ended with the fame rhyme. It is in such verse that the Alcoran is faid to be written.

The modern Arabian poetry takes its date from the caliphate of Al Raschid, who lived toward the close of the eighth century. Under him poetry became an art, and laws of profody were laid down. Their comparisons, in which they abound, are taken, with little choice, from tents, camels, hunting, and the ancient

manners of the Arabs.

201

Mechanical

That some of the Arabs had a good degree of know-

ledge in feveral mechanical arts, appears from Strabo, Arabia. who informs us, that the people of Tamna and the adjacent provinces had magnificent temples, and elegant houses, built in the Egyptian taste. The same author likewise relates, that in Arabia Felix, belides the husbandmen, there were many artificers; and, amongst others, those who made palm wine, which, he intimates, was much used by the Arabs. As for the exercife of arms and horfemanship, they looked upon this as one of their principal accomplishments, being obliged to practife and encourage it by reason of the independency of their tribes, whose frequent jarring made wars almost continual amongst them, which for the most part ended in field battles. Hence it became an ufual faying amongst them, that God had bestowed four peculiar things on the Arabs, viz. turbans inflead of diadems, tents instead of walls and houses, swords instead of intrenchments, and poems instead of written laws. The principal arms used by the ancient Arabs were bows and arrows, darts or javelins, and broad swords or scimitars. The bows and arrows were the most ancient of these; being used by Ishmael himself, according to Scripture. It is probable also, that some of them were acquainted with every branch of the military art cultivated by their neighbours the Egyptians, Syrians, and Phœnicians.

Before the Portuguese interrupted the pavigation of Commerce. the Red sea, the Arabs were the factors of all the trade that passed through that channel. Aden, which is situated at the most fouthern extremity of Arabia upon the Indian ocean, was the mart in those parts. The situation of its harbour, which opened an easy communication with Egypt, Ethiopia, India, and Perfia, had rendered it, for many ages, one of the most flourithing factories in Asia. Fifteen years after it had repulsed the great Albuquerque, who attempted to demolifa it in 1513, it submitted to the Turks, who did not long remain mafters of it. The king of Yemen, who polfessed the only district in Arabia that merits the title of Happy, drove them from thence, and removed the trade to Mocha, a place in his dominions which till then was only a village.

This trade was at first inconsiderable; consisting principally in myrrh, incense, aloes, balm of Mecca, fome aromatics, and medicinal drugs. These articles, the exportation of which is continually retarded by exorbitant imposts, and does not exceed at present 30,6251. were at that time more in repute than they have been fince: but must have been always of little confequence. Soon after a great change enfued from the introduction of coffee.

Though this article is generally used in the Arabian entertainments, none but the rich citizens have the pleafure of taffing the berry itself. The generality are obliged to content themselves with the shell and the husk of this valuable production. These remains, so much despised, make a liquor of a pretty clear colour, which has a taste of coffee without its bitterness and strength. These articles may be had at a low price at Betelfagui, which is the general market for them. Here likewife is fold all the coffee which comes out of the country by land. The reft is carried to Mocha, which is 35 leagues distant, or to the nearer ports of Lochia or Hodeida, from whence it is transported in fmall vessels to Jodda. The Egyptians fetch it from

Arabia. the last mentioned place, and all other nations from the former.

> The quantity of coffee exported may be estimated at twelve millions five hundred and fifty thousand weight. The European companies take off a million and a half; the Persians three millions and a half; the fleet from Sucz fix millions and a half; Indostan, the Maldives, and the Arabian colonies on the coast of Africa, lifty thousand; and the caravans a million.

> As the coffee which is bought up by the caravans and the Europeans is the bell that can be procured, it colls about 8 d. a pound. The Persiaus, who content themselves with that of an inferior quality, pay no more than about 6;d. a pound. The Egyptians purchase it at the rate of about 8d; their cargoes being composed partly of good and partly of bad coffee. If we ellimate coffee at about 7 d. a pound, which is the mean price, the profits according to Arabia from its annual exportation will amount to 384,3431. 158. This money does not go into their coffers; but it enables them to purchase the commodities brought from the foreign markets to their ports of Jodda and Mocha.

> Mocha receives from Abyssinia, sheep, elephants teeth, musk, and slaves. It is supplied from the eastern coast of Africa with gold, slaves, amber, and ivory; from the Persian gulf, with dates, tobacco, and corn; from Surat, with a vast quantity of coarse, and a few fine linens; from Bombay and Pondicherry, with iron, lead, and copper, which are carried thither from Europe; from Malabar, with rice, ginger, pepper, Indian fastron, with coirce cardamom, and also with planks; from the Maddives, with gum, benzoin, aloes wood, and pepper, which thefe islands take in exchange; from Coromandel, with 400 or 500 bales of cottons, chiefly blue. The greatest part of these commodities, which may fetch 262,500l. are confumed in the interior part of the country. The rest, particularly the cottons, are disposed of in Abyssinia, Socotora, and the eaftern coast of Africa.

> None of the branches of bufinels which are managed at Mocha, as well as throughout all the country of Yaman, or even at Sanaa the capital, are in the hands of the natives. The extortions with which they are perpetually threatened by the government deter them from interfering in them. All the warehouses are occupied by the Banians of Surat or Guzerat, who make a point of returning to their own country as foon as they have made their fortunes. They then refign their settlements to merchants of their own nation, who retire in their turn, and are fucceeded by others.

> The European companies, who enjoy the exclusive privilege of trading beyond the Cape of Good Hope, formerly maintained agents at Mocha. Notwithstanding it was flipulated by a folemu capitulation, that the imposts demanded should be rated at two and a quarter per cent. they were subject to frequent extortions: the governor of the place infifting on their making him presents which enabled him to purchase the favour of the courtiers, or even of the prince himself. However the profits they obtained by the fale of European goods, particularly cloths, made them submit to these repeated humiliations. When these several articles were furnished by Grand Cairo, it was then impossible to withfland the competition, and the fixed fettlements were therefore given up.

The trade was carried on by thips that failed from Araba Europe with iron, lead, copper, and filver, fusficient to pay for the collec they intended to buy. The fuper- Arabici. cargoes, who had the care of these transactions, settled the accounts every time they returned. These voyages, which at first were pretty numerous and advantageous, have been fuccessively laid aside. The plantations of coffee, made by the European nations in their colonies. have equally leffened the confumption and the price of that which comes from Arabia. In process of time. these voyages did not yield a sufficient profit to answer the high charges of undertaking them on purpose. The companies of England and France then refolved, one of them to fend thips from Bombay, and the other from Pondicherry, to Mocha, with the merchandise of Europe and India. They even frequently had recourfe to a method that was lefs expensive. The English and French visit the Red sea every year. Tho' they dispose of their merchandise there to good advantage, they can never take in cargoes from thence for their return. They carry, for a moderate freight, the coffee belonging to the companies, who lade the veffels with it, which they despatch from Malabar and Coromandel to Europe. The Dutch company, who prohibit their fervants from fitting out flips, and who fend no veffels themselves to the gulf of Arabia, are deprived of the share they might take in this branch of commerce. They have also given up a much more lucrative branch, that of Jodda.

Jodda is a port fituated near the middle of the gulf of Arabia, 20 leagues from Mecca. The government there is of a mixed kind : the grand figurer and the xeriff of Meeca share the authority and the revenue of the customs between them. These imposts are levied upon the Europeans at the rate of 8 per cent. and upon other nations at 13. They are always paid in merchandife, which the managers oblige the merchants of the country to buy at a very dear rate. The Turks who have been driven from Aden, Mocha, and every part of Yaman, would long ago have been expelled from Jodda, if there had not been room to apprehend that they might revenge themfolies in fuch a manner as to put an end to their pilgrimages and commerce.

The coins which are current at Mocha, the principal port of the Red fea, are dollars of all kinds; but they abate five per cent. on the pillar dollars, because they are reckoned not to be the pureft filver, and the dollar weight with them is 17 drachms 14 grains. All their coins are taken by weight, and valued according to their pureness. The gold coins current here are ducats of Venice, Germany, Turkey, Egypt, &c. The comasses are a small coin, which are taken at such a price as the government fets on them; and they keep their accounts in an imaginary coin, called cabeers, of which 80 go to a dollar. For an account of the ancient coins called dinars and dirhems, fee these two articles.

Gum ARABIC. See Gum.

ARABICI, a fect who fprung up in Arabia about the year 207, whose distinguishing tenet was, that the foul died with the body, and also rose again with it.

Eusebius, Lib. VI. c. 38. relates, that a council was called to stop the progress of this rising sect; and that Origen affifted at it, and convinced them fo thoroughly of their error that they abjured it.

ARABIS, BASTARD TOWER MUSTARD: A genus of the filiquofa order, belonging to the tetradynamia Assean. class of plants; and in the natural method ranking under the 30th order Siliquofe. The generic mark confifts in 4 nectiferous glands which lie on the infide of each leaf of the calvx. There are eight species; but none of them remarkable for their beauty or other properties. Only one of these, the thaliana or mouse-ear, is a native of Britain. It is a low plant, feldom rifing more than four or five inches high, branching on every fide, having small white flowers growing alternately, which have each four petals in form of a cross, that are succeeded by long flender pods filled with fmall round feeds. It grows naturally on fandy ground or old walls. Sheep are not fond of it, and swine refuse it.

ARABISM, ARABIMUS, an idiom or manner of fpeaking peculiar to the Arabs or the Arabic lan-

gaage.

ARABIST, a person curious of, and skilled in, the learning and languages of the Arabians: fuch were Erpenius and Golius. The furgeons of the 13th century are called Aralifls by Severinus.

ARABLE LANDS, those which are fit for tillage,

or which have been formerly tilled.

ARACAN, the capital of a fmall kingdom to the north-cast of the bay of Bengal, situated in E. Long. 63. O. N. Lat. 20. 30. It has the conveniency of a spacious river, and a harbour large enough to hold all the Pups in Tanope. It is faid by Schouten to be as large as Amsterdam; but the houses are slight, being made with palm trees and bamboo canes, and covered with leaves of trees. They are feldom above fix feet high, but have many windows or air holes. But the people of the highest rank are much better accommodated. They have no kitchens, chimneys, or cellars, which obliges the women to drefs the victuals out of doors. Some of the flreets are on the ridges of rocks, wherein are a great many shops. Their orchards and gardens contain all the fruits common to the Indies, and their trees are green all the year. Their common drink is toddy; which is the fap of the cocoa-tree, and when new, will intoxicate like wine, but foon grows four. Elephants and buffaloes are very numerous here, and are made use of inflead of horses. They have plenty of provisions, and but little trade : for when Mr Channoch was here in 1686, with fix large ships, there was nothing to be had in the way of commerce; and yet the country produces lead, tin, flick lac, and elephants tecth. The Mogul's fubjects come here to purchase these commodities; and sometimes meet with diamonds, rubies, and other precious flones. They were formerly governed by a king of their own, called the king of the White Elephant; but this country has been conquered by the king of Pegu. They pay little or no regard to the chaftity of their women, and the common failors take great liberties among them. Their religion is Paganism; and the idols, temples, and priests are very numerous. The dress of the better fort is very flight, for it confilts chiefly of a piece of white cotton over their arms, breaft, and belly, with an apron before. The complexion of the women is tolerable; they wear thin flowered gauze over their breaft and shoulders, and a piece of cotton, which they roll three or four times round their waill, and let it hang as low as their feet. They curl their hair, and put glafs rings

in their ears, and stretch them of a monstrous length. Arachis On their aims and legs they have hoops of copper, ivory, filver, &c. The country produces great quantities of rice, and the water is good. Their flocks of sheep and herds of cattle are also numerous near Aracan; but what they fay of the towns and villages, with which the country is pretended to be overspread, may be doubted. Captain Hamilton affirms, that there are but few places inhabited, on account of the great number of wild elephants and buffaloes, which would deflroy the fruits of the ground; and that the tigers would defroy the tame animals. There are fome iflands near the fea, inhabited by a few miferable fiftermen, who can just keep themselves from starving, though they are out of the reach of oppression. The rich burn the dead bodies; but the poor, who are not

able to buy wood, throw them into the river.

ARACHIS, in botany: A genus of the diadelphia order, belonging to the decandria class of plants; and, in the natural method, ranking under the 32d or-der Papilionacea. There is only one species, the hypogaa, an annual plant, and a native of Brafil and Peru. The stalks are long, trail upon the ground, and are furnished with winged leaves, composed of four hairy lobes each. The flowers are produced fingly on long peduncles; they are yellow, of the pea kind, and each contains ten awl-shaped stamina, nine of which are tied together, and the upper one stands off. In the centre is an awl-shaped stylus, crowned with a simple stigma. The germen is oblong, and becomes an oval oblong pod, containing two or three oblong blunt feeds. -This plant is cultivated in all the American fettlements for the feeds, which make a confiderable part of the food of the flaves. The manner of perfecting them is very fingular: for as the flowers fall off, the young pods are forced into the ground by a natural motion of the stalks, and there they are entirely buried, and not to be discovered without digging for them; whence they have taken the name of ground nuts.

ARACHNE, in fabulous history, a young maid of Lydia, faid to have been the inventrels of spinning. She is fabled to have been fo skilful in this art, as to challenge Minerva at it; who tore her work, and struck her, which difgrace driving her to difpair, she hanged herfelf. Minerva from compassion brought her to life, and transformed her into a spider, which still employs

itself in spinning.

ARACHNOIDES, in anatomy, an appellation given to several membranes; as the tunic of the crystalline humour of the eye, the external lamina of the pia mater, and one of the coverings of the spinal mar-

ARACK, ARRACK, or RACK, a spirituous liquor imported from the East Indies, used by way of dram

and in punch.

The word arack, according to Mr Lockyer, is an Indian name for ftrong waters of all kinds: for they call our spirits and brandy English arack. But what we understand by the name arack, he affirms is really no other than a spirit procured by distillation from a vegetable juice called toddy, which flows by incision out of the cocoa nut tree, like the birch juice procured among us. The toddy is a pleafant drink by itfelf, when new, and purges those who are not used to it: and, when stale, it is heady, and makes good vinegar.

Arack. The English at Madrass use it as leaven to raise their bread with.

> Others are of opinion, that the arack or arrack, is a vinous spirit obtained by distillation, in the East Indies, from vice or fugar, fermented with the juice of cocoa

> The Goa arack is faid to be made from the toddy, the Batavia arack from rice and fugar; and there is likewife a kind of flirub from which arack is made.

> Goa and Batavia are the chief places for arack.—At Goa there are divers kinds; fingle, double, and treble diffilled. The double diffilled, which is that commonly fent abroad, is but a weak spirit in comparison with Batavia arack; yet, on account of its peculiar and agreeable flavour, is preferred to all the other aracks of India. This flavour is attributed to the earthen veffels which they use at Goa to draw the spirit; whereas at Batavia they use copper stills.

> The Parier arack made at Madrafs, and the Columbo and Quilone arack at other places, being fiery hot spirits, are little valued by the Europeans, and therefore rarely imported; though highly prized among the natives. In the best Goa arack, the spirits of the cocoa juice do not make above a fixth or eighth part.

> The manner of making the Goa arack is this: The juice of the trees is not procured in the way of tapping, as we do; but the operator provides himfelf with a parcel of earthen pots, with bellies and necks like our ordinary bird bottles: he makes fast a number of these to his girdle, and any way elfe that he commodiously Thus equipped, he climbs up the can about him. trunk of a cocoa tree; and when he comes to the boughs, he takes out his knife, and cutting off one of the fmall knots or buttons, he applies the mouth of the bottle to the wound, fastening it to the bough with a bandage; in the same manner he cuts off other buttons, and fastens on his pots, till the whole number is used: this is done in the evening, and descending from the tree, he leaves them till the next morning; when he takes off the bottles, which are mostly filled, and empties the juice into the proper receptacle. This is repeated every night, till a sufficient quantity is produced; and the whole being then put together, is left to ferment, which it foon docs. When the fermentation is over, and the liquor or wash is become a little tart, it is put into the still, and a fire being made, the still is fuffered to work as long as that which comes over has any confiderable tafte of spirit.

> The liquor thus procured is the low wine of arack; and this is fo poor a liquor, that it will foon corrupt and fpoil, if not diffilled again, to separate some of its phlegm; they therefore immediately after pour back this low wine into the still, and rectify it to that very weak kind of proof spirit, in which state we find it. The arack we meet with, notwithstanding its being of a proof tell, according to the way of judging by the crown of bubbles, holds but a fixth, and fometimes but an eighth part of alcohol, or pure spirit; whereas our other spirits, when they show that proof, are generally esteemed to hold one half pure spirit. Shaw's Effay on Distilling.

> There is a paper of observations on arack, in the Melanges d' Histoire Natur. Tom. V. p. 302. By fermenting, distilling, and rectifying the juice of the American maple, which has much the fame talle as that of the

cocoa, the author faye, he made arack not in the least. Arack, inferior to any that comes from the East Indies; and he thinks the juice of the fycamore and of the birch trees would equally answer the end.

Befides the common forts of Goa and Batavia arack, there are two others lefs generally known; thefe are the bitter arack and the black arack.

By stat. 11th Geo. I. c. 30. atack, on board a ship within the limits of any port of Great Britain, may be fearched for and feized, together with the package; or if found unfhipping or unfhipped, before entry, may be feized by the officers of excile, in like manner as by the officers of the customs.—Upon an excite officer's fuspicion of the concealment of arack, and oath made of the grounds of fuch fufpicion before the commissioners or a jultice of peace, they may empower him to enter fuch fulpected places, and feize the liquors, with the calks, &c. If the officers are obstructed, the penalty is 100l.

Arack is not to be fold but in warehouses, entered as directed in the 6th of Geo. I. c. 21. upon forfeiture, and the calles, &c. If permits are not returned which are granted for the removal of arack, or if the goods are not fent away within the time limited, the penalty is treble the value. If the permits are not returned, and the decrease is not found to be sufficient, the like quantity is forfeited. Permits are not to be taken out but by direction in writing of the proprietor of the flock, or his known fervant, upon forfeiture of 5cl. or three months impriforment.

By flat, 9th Geo. H. c. 35, if arack is offered to fale without a permit, or by any hawker, pedlar, &c. with a permit, the person to whom it is offered may seize and carry it to the next warehouse belonging to the cultoms or excite, and bring the perfor offering the fame before any juffice of the peace, to be committed to prifon, and profecuted for the penalties incurred by fuch offence. The perfor feizing fach goods may profecute in his own name; and on recovery is entitled to one-third part of the grofs produce of the fale; and the commissioners are, it defined, upon a certificate from the justice of the offender's being committed to prifon.

Atack (except for the use of seamen, two gallons each) found in any flip or veiled arrived from foreign parts, at anchor, or hovering within the limits of any port, or within two leagues of the feore; and not proeceding on her voyage (unlets in case of unavoidable necessity and distress of weather, notice whereof must be given to the collector or chief officer of the port upon the ship's arrival), is forfeited, with the boxes, caiks, or other package, or the value thereof.

to advance to the forzer 15% per gallon for the arack

fo feized.

Arack is also the name of a sprituous beguer made by the Tartars of Tungufia, of marcs milk, left to four, and afterwards diffilled twice or thrice between two carthen pots closely stopped, whence the liquor runs through a fmall wooden pipe. It is more intoxicating than brandy.

ARAD (anc. geog.), a city lying to the fouth of Judah and the land of Canaan, in Arabia Petrwa. The Ifraclites having advanced towards the land of Canaan (Numb. xxi. 1.), the king of Arad opposed their paffage, defeated them, and took a great booty from them; but they deltrojed his country as foon as they

Aral.

Aradus Araometer. became masters of the land of Canaan (Numb. xxxiii.) Arad was rebuilt, and Eusebius places it in the neighbourhood of Kades, at the distance of 25 miles from Hebron. The Israelites, in their passage through the wilderness, having departed from Sepher, came to Arad, and from thence to Makkelath.

ARADUS (anc. geog.), an island between the borders of Phænicia and Scleucia, at the distance of 20 stadia from a dangerous coast: all of it a rock furrounded by the fea, in compass seven stadia; and forming a very powerful city and republic. It is now called Ronad; but not a fingle wall is remaining of all that multitude of houses which, according to Strabo, were built with more flories than even those of Rome. The liberty enjoyed by the inhabitants had rendered it very populous; and it sublisted by naval commerce, manufactures, and arts. At present the island is deferted; nor has tradition even retained the memory of a fpring of fresh water in its environs, which the people of Aradus discovered at the bottom of the sea, and from which they drew water in time of war by means of a leaden bell and a leathern pipe fitted to its bottom.

ARÆ PHILÆNON, OF PHILÆNORUM (Strabo); to the fouth of the Syrtis Major; but in Peutinger more westerly, to the fouth almost of the Syrtis Minor. In Strabo's time, the altars were not extant, but a village of the same name stood on the spot. On a difpute about limits, between the Cyreneans and Carthaginians, it was agreed that two of each people fhould fet out on the fame day, and that where they should happen to meet, there the limits of both should be fixed. The Philani, two brothers, Carthaginians, undertook it for Carthage: thefe, after having advanced a great many miles into the territory of the Cyreneans, were met by their antagonists; who, enraged at their being beforehand with them so far, gave them the option of either returning back, or of being buried alive on the fpot. Like zealous patriots, they chose the latter; and there the Carthaginians raised two altars in honour of the Philani. (Sallust, Valerius

ARÆOMETER, an instrument wherewith to meafure the density or gravity of sluids.

The armometer, or waterpoife, is usually made of glass; confishing of a round hollow ball, which terminates in a long flender neck hermetically fealed at top: there being first as much running mercury put into it as will ferve to balance or keep it swimming in an erect position.

The stem is divided into degrees (as represented Plate XXXII. sig. 23.); and by the depth of its descent into any liquor, the lightness of that liquor is concluded: for that sluid in which it sinks least must be heaviest: and that in which it sinks lowest lightest.

M. Homberg has invented a new arzometer, described in Phil. Transact. No 262, thus: A is a glass bottle or matrass, with so slender a neck that a drop of water takes up in it about five or fix lines, or half of an inch. Near that neck is a small capillary tube D, about fix inches long, and parallel to the neck.—To the vessel, the liquor is poured in at the mouth B which is widened to receive a tunnel), till it run out the D, that is, till it rise in the neck to the mark C, which means you have always the same bulk or stitly of liquor; and consequently, by means of the

balance, can easily tell, when different liquors sill it, Arzonnewhich weighs most, or is most intensely heavy.

Some regard, however, is to be had in these trials to the season of the year, and degree of heat and cold in the weather; because some liquors rarefy with heat and condense with cold more than others, and accordingly take up more or less room.

By means of this inftrument, the ingenious author has made a table to show the different weights of the same bulk of the most considerable chemical liquous both in summer and winter, as follows:

		Weighed in fuminer.				In winter.		
The armometer ful	l of	oz.	dr.	gr.		0°.	dr.	gr.
Quickfilver,	-		00	06	-	1 I	00	32
Oil of tartar,	-	01	03	c8	-	01	03	31
Spirit of urine,	-	10	00	32	-	01	00	43
Oil of vitriol,	-	01	03	58	-	Ol	04	03
Spirit of nitre,	-	10	01	40	-	01	01	70
Spirit of falt,	-	01	00	39	-	01	00	47
Aquafortis,	-	10	10	38	•	10	10	55
Vinegar,	-	00	07	55	-	00	07	бо
Spirit of wine,	-	00	06	47	-	00	υ6	61
River water,	-	00	07	53	-	00	07	57
Distilled water,	-	00	07	50	-	00	07	54

The inftrument itself weighed, when empty, one drachm twenty-eight grains. See Hydrometer.

ARÆQPÁGUS. See AREOPAGUS.

ARÆOSTYLE, in architecture, a term used by Vitruvius, to fignify the greatest interval which can be made between columns.

ARÆOTICS, in medicine, remedies which rarefy the humours, and render them easysto die carried off by the pores of the skin.

ARAF, among the Mahometans. See Alaraf. ARAFAH, the ninth day of the last month of the Arabic year, named Dhoulhegiat; on which the pilgrims of Mecca perform their devotions on a neighbouring mountain called Arafat. The Mahometans have a very great veneration for this mountain, because they believe that Adam and Eve, after they were banished out of Paradise, having been separated from each other during 120 years, met afterwards on this

ARAFAT, or GIBEL EL ORPHAT, the mountain of knowledge, a mountain in Arabia, near Mecca. The Mahometans fay this was the place where Adam first met with and knew his wife Eve after their expulsion from Paradife. This mountain not being large enough to contain all the devotees that come annually in pilgrimage to Mecca, stones are fet up all round it to show how far it reaches. The pilgrims are clad in robes of humility and mortification, with their heads uncovered. They feem to be very much affected; for the tears flow down their cheeks, and they fob and figh most bitterly, begging earnestly for remission of sins, and promiting to lead a new life. They continue here about four or five hours, and at half an hour after funfet they all decamp to perform a religious duty called Askam After this, they all receive the honourable title of hadgees, which is conferred upon them by the imam or priest. This being pronounced, the trumpet founds, and they all return to Mecca.

ARAGON. See Arragon.

mountain.

ARAL, a great lake in the kingdom of Khowa-

Arshum, razm, lying a little to the eastward of the Caspian sea. Aralia. Its length from north to fouth is said to be near 150 miles, and its breadth from east to west about 70. The shore on the west side is high and rocky, and destitute of good water: yet there are abundance of wild horses, asses, antelopes, and wolves; as also a fierce creature called a jolbart, which the Tartars fay is of fuch a prodigious strength as to carry off a horse. It is furpriting that this lake should be quite unknown to geographers till within these few years. Several great rivers, which were supposed to run into the Caspian fea, are now known to fall into this lake, particularly the Silun or Sirr, and the Gilun or Amo, fo often mentioned by the Oriental historians. This lake, like the Caspian sea, has no visible outlet. Its water is also very falt; and for that reason is conveyed by the neighbouring inhabitants by fmall narrow canals into fandy pits, where the heat of the fun, by exhaling the water, leaves them a sufficient quantity of falt. The same kinds of fish are found in Aral that are found in the Caspian sea. The former is also called the Lake of Eagles.

ARAHUM, or HARAHUM, in ancient writers, denotes a place confecrated or fet apart for holy purpofes. Hence the phrase in araho jurare, or conjurare, "to make oath in the church;" because, by the Ripuarian laws, all oaths were to be taken in the church on the relicks of the faints.

ARALIA, the Angelica TREE: A genus of the pentagynia order, belonging to the pentandria class of plants; and in the natural method ranking under the 46th order, Hederacea. The effectial characters are: The involucrum is an umbella; the calyx is quinquedentated, and above the fruit; the corolla confitts of five petals; and the berry has five feeds.

Species. There are five species of Aralia, all natives of the Indies. The principal arc, 1. The nudicaulis, having a naked stalk. This grows three or four feet high; the leaves have two large trifoliate lobes, which are fawed on their edges. The flower stalks arise between thefe, immediately from the root, and are terminated by round umbels of small four-leaved flowers of a whitish colour. The roots of this species were brought over from North America, and fold here for farfaparilla, and it is still used as such by the inhabitants of Canada; though it is very different from the true fort. 2. The spinosa, with a prickly stem, is a very ornamental shrub, and a native of Virginia. The height to which this tree will grow, if the foil and fituation wholly agree with it, is about twelve feet; and the flem, which is of a dark brown colour, is defended by sharp spines, which fall off; even the leaves, which are branching, and composed of many wings, and are of a pleasant green colour, have these defenders, which are both crooked and ftrong, and ftand as guards to them till the leaves fall off in the autumn. The flowers are produced in large umbels from the ends of the branches: They are of a greenish yellow colour: and their general characters indicate their ftructure. They make their appearance in the end of July or beginning of August; but are not succeeded by ripe feeds in our gardens.

Propagation and culture of the Spinosa. This tree will what gardeners call fpann; i. e. after digging among the roots, young plants will arife, the broken roots fending forth fresh stems; nay, if the roots are

planted in a warm border, and shaded in hot wea- Aralia. ther, they will grow; but if they are planted in pots, and affifted by a moderate warmth of dung, or tanner's bark, they will be pretty fure of fuccess; so that the propagation of this tree is very easy. But the general method of propagating it, and by which the best plants may be had, is from seeds, which must be procured from America, for they do not ripen in Britain; and, after having obtained them, they must be managed in the following manner: The time that we generally receive them is in the fpring; fo that against their coming we must be furnished with a sufficient number of large pots. These, when the seeds are come, must be filled with fine mould, which, if taken from a rich border, will do very well. The feeds must be fown in these spots as soon as possible after their arrival, hardly half an inch deep, and then the pots should be plunged in a warm place their whole depth in the foil. Care must be taken to break the mould in the pots, and water them as often as it has a tendency to crust over; and if they are shaded in hot weather, the plants will frequently come up the first fummer. But as this does not often happen, if the young plants do not appear by midfummer, the pots should be taken and plunged in a finally place; nay, if they should, there will be still more occasion for this being done; for they will flourish after that better in the fhade; and the defign of plunging them in a warm place at first was only with a view of setting the powers of vegetation at work, that, having natural heat, artificial shade also may be given them, and water likewise, the three grand necessaries for the purpote. The pots, whether the plants are come up in them or nor, should be removed into thelter in October, either into a greenbouse, some room, or under a hotbed frame; and in the spring when all danger of frost is over, they should be plunged into the natural ground then own depth in a fhady place. Those that were already come up will have that strong by the autumn following; and if none of them have appeared, they will come up this fpring; and whether they are young feedlings, or finall plants of a former fummer's growth, they must be constantly kept clean of weeds, and duly watered in the time of drought; and this care must be observed until the autumu. In October they must be again removed into shelter, either into a greenhouse, &c. as before, or fixed in a warm place, and hooped, that they may be covered with mats in frolly weather. In the latter end of March following, they should be planted in the nursery way, to gain strength before they are finally planted out. The ground for this purpose, besides the natural shelter, should have a reed hedge, or something of the like nature, the more effectually to prevent the piercing winds from destroying the young plants. In this snug place the plants may be fet in rows: in each of which rows furze bushes should be stuck the whole length; and all thefe together will enfure their fafety. But here one caution is to be observed; not to stick the furze so thick, but that the plants may enjoy the free air in mild weather, and not to take them away too early in the fpring, left, being kept warm the whole winter, and being deprived of their protection, a cutting froft should happen, as it sometimes does even in April, and deftroy them. Weeding and watering in dry weather must be their summer's care. They may be stuck again with furze bushes in the winter; though it will not be necessary

Aram

necessary to do it in so close a manner; and with this care, still diminishing in proportion the number of furze bushes, they may continue for three or four years, when they may be planted out into the warmest parts of the plantation. With this management these plants will be inured to bear our winters in well-sheltered

The spines which grow on the branches and the leaves admonish us, for our own fafety, not to plant this tree too near the fides of frequented walks; and the consideration of the nature of the tree, which is rather tender at the best, directs us (if we have a mind to retain the fort) to plant it in a warm and well-sheltered fituation; where the piercing frosts, come from what point they will, will lose their edge: for without this, they will be too tender to stand the test of a severe winter; though it has often happened, that after the main stem of the plant has been destroyed, it has shot out again from the root, and the plant by that means been both increased and preserved.

ARAM, or Araman Regio (anc. geog.), the Hebrew name of Syria, so called from Aram the son of

Shem, (Moses, Josephus).

ARAM Beth-Rehob, (anc. geog.) was that part of Syria lying to the north of Palestine; because Rehob was its boundary towards that quarter, (Mofes); allotted to the tribe of Asher, (Judges); where it joins Sidon, (Joshua).

ARAM-Dammesek, or Syria Damascena, (anc. geog.) a principal part of Syria, and more powerful than the rest (2 Sam.), taking its name from Damascus, the

principal city.

ARAM-Maacha, (anc, geog.) a district of Syria, at the foot of Mount Hermon, (2 Samuel 1 Chronicles)'; on the borders of the half tribe of Manasseh, on the other fide the Jordan, called the coast of Mauchathi, (Moses, Joshua.)

ARAM-Naharaim, (anc. geog.), i. e. Aram, or Syria of the Rivers, or Mesopotamia, situated between the Euphrates and Tigris; which is the reason of the name.

ARAM-Soba, or, Zoba, (anc. geog.), which David conquered, was a country near the Euphrates, where afterwards Palmyra stood: the Euphrates bounded it on the east, as the land of Canaan and Syria Damascena did on the west, (2 Samuel.)

ARAMONT, a town of Languedoc in France, feated on the river Rhone. E. Long. 4. 52. N. Lat.

ARANEA, the Spider; a genus of infects belonging to the order of aptera, or infects without wings.

All the species of spiders have eight legs, with three Aranea joints in each, and terminating in three crooked claws; eight eyes, two before, two behind, and the reft on the fides of the head. In the fore part of the head, at the mouth, there is a pair of sharp crooked claws or forceps: these stand horizontally; and, when not exerted for use, are concealed in two cases contrived for their reception, in which they fold like a clasp-knife, and there lie between two rows of teeth. A little below the point of each claw, there is a fmall hole, through which Leeuwenhoeck supposes the spider emits a kind of poison (A). These claws are the weapons with which they kill flies, &c. for their food. The belly or hinder part is separated from the head and breast by a small thread-like tube. The skin or outer surface is a hard polished crust.

Spiders have five tubercles or nipples at the extremity of the belly, whose apertures they can enlarge or contract at pleasure. It is through these apertures that they spin a glucy substance with which their bellies are full. They fix the end of their threads by applying these nipples to any substance, and the thread lengthens in proportion as the animal re-They can stop the issuing of the cedes from it. threads by contracting the nipples, and re-ascend by means of the claws on their feet, much in the fame manner as some men warp up a rope. When the common house spider begins her web, she generally chooses a place where there is a cavity, fuch as the corner of a room, that she may have a free passage on each side, to make her escape in case of danger. Then she sixes one end of her thread to the wall, and palles on to the other side, dragging the thread along with her (or rather the thread follows her as the proceeds), till the arrives at the other fide, and there fixes the other end of it. Thus the passes and repasses, till the has made as many parallel threads as the thinks necessary for her purpose. After this, she begins again and crosses these by other parallel threads, which may be named the woof. These are the toils or fnares which the prepares for entangling flies, and other small insects, which happen to light upon it. But, besides this large web she generally weaves a small cell for herself, where she lies concealed watching for her prey, Betwixt this cell and the large web she has a bridge of threads, which by communicating with the threads of the large one, both give her early intelligence when any thing touches the web, and enable her to pass quickly in order to lay hold of it. There are many other methods of weaving peculiar to different species of spiders; but as they are all intend-

(A) Dr Mead, in his Essay on Poisons, diffents wholly from this opinion, having never been able, on repeated examinations, to discover any such opening, not even in the claws of the largest foreign spider; which being above fifty times bigger than any of the European spiders, would more easily have afforded a view of this opening, if nature had allotted any to this part of the animal. Besides, repeated observations also convinced him that nothing dropped out of the claws, which were always dry while the spider bit any thing, but that a short white proboscis was at the same instant thrust out of the mouth, which instilled a liquor into the wound. And the fame author observes, that the quantity of liquor emitted by our common spiders when they kill their prey, is vilibly fo great, and the wounding weapons fo minute, that they could contain but a very inconfiderable portion thereof, if it were to be discharged that way. Baker's Microscope, p. 196. Spiders frequently call their skins, which may be found in the webs perfectly dry and transparent; and from such skins the forceps, or claws, for they are always shed with the skins, may easier be separated, and examined with much greater exactness, than in the common spider while living.

men ed for the same purpose, it is needless to give particu-- lar descriptions of them.

> That darting out of long threads, however, which has been observed by naturalitis, and by means of which fome species can convey themselves to great distances, deferves particular notice.

> Dr Lifter tells us, that attending closely to a spider weaving a net, he observed it suddenly to defift in the mid-work; and turning its tail to the wind, it darted out a thread with the violence and Ilream we fee water fpout out of a jet; this thread, taken up by the wind, was immediately carried to fome fathoms long; fill iffuing out of the belly of the animal. By-and-by the spider leaped into the air, and the thread mounted her up fwiftly. After this discovery, he made the like observation in near thirty different forts of spiders; and found the air filled with young and old, failing on their threads, and doubtlefs feizing gnats and other infects in their passage, there being often manifest signs of flaughter, legs and wings of flies, &c. on thefe threads, as well as in their webs below. Dr Hulfe discovered the same thing about the same time.

Dr Lifter thinks there is a fair hint of the darting of spiders in Aristotle, Hill. An. Lib. IX. cap. 39. and in Pliny, Lib. X. cap. 74. But with regard to their failing the ancients are filent, and he thinks it was first feen by him. He also observes of those failing fpiders, that they will often dart, not a fingle thread only, but "a whole sheaf at once, consisting of many filaments; yet all of one length, all divided each from the other, and diffinct until some chance either snap them off or entangle them. But for the most part you may observe, that the longer they grow, the more they spread, and appear to a diligent observer like the numerous rays in the tail of a blazing flar. As for that which carries them away in the air, fo fwift off-hand, it is (as I have already hinted) partly their fudden leap; partly the length and number of the threads projected, the stream of the air and wind beating more forcibly upon them; and partly the posture and management of their feet, which, at least by some fort of them, I have observed to have been used very like wings or oars, the feveral legs (like our fingers) being fometimes close joined, at other times opened, again bent, extended, &c. according to the feveral necessities and will of the failor. To fly they cannot be strictly faid, they being carried into the air by external force; but they can, in case the wind suffer them, sleer their courfe, and perhaps mount and descend at pleasure: and to the purpose of rowing themselves along the air, it is observable that they ever take their flight backwards; that is, their head looking a contrary way, like a fculler upon the Thames. It is fcarce credible to what height they will mount; which yet is precifely true, and a thing eafily to be observed by one that shall fix his eye some time on any part of the heavens, the white webs, at a vall distance, very ciffinelly appearing from the azure fley; but this is in autumn only, and that in very fair and calm weather." In a letter to Mr Ray, dated January 1670, speaking of the height spiders are able to fly to, he says, " Last October, &c. I took notice, that the air was very full of webs; I forthwith mounted to the top of the highest steeple on the Minster (in York), and could there differn them yet exceeding high above me."

Vol. II. Part I.

He further observes, that they not only thus shoot Aranea. their threads upward, and mount with them in a line almost perpendicular; they also project them in a line parallel to the horizon, as may be feen by their threads running from one wall to another in a house, or from one tree to another in the field, and even from wall to wall across gardens of considerable extent.

The matter of which the spider's threads are formed, we have observed, is a viscid juice, elaborated in the body of the animal, and emitted from papillæ fituated at the extremity of the belly; which papille are furnished with numerous apertures that do the business of wire drawers, as it were, in forming the threads. Of these apertures M. Reaumur observes, there are enough in the compass of the smallest pin's head to yield a prodigious quantity of diffinct threads. The holes are perceived by their effects; take a large gardenfpider ready to lay its eggs, and applying the finger on a part of its papiliæ, as you withdraw that finger it will take with it an amazing number of different threads. M. Renumur has often counted 70 or 80 with a microfcope, but has perceived that there were infinitely more than he could tell. In effect, if he should fay that each tip of a papillæ furnishe? a thoufand, he is perfuaded he would fay much too little. The part is divided into an infinity of little protainences, like the eyes of a butterfly, &c. Each prominence no doubt makes its feveral threads; or rather between the feveral protuberances there are holes that give vent to thread; the ufe of the protuberance, in all probability, being to keep the threads at their first exit, Lefore they are yet hardened by the air, afunder. In tome spiders those protuberances are not so sensille; but in lieu thereof there are tofts of had which may terve the same office, viz. to keep the threads apart. Be this as it will, there may threads come out at above a thousand different places in every papilla; confequently the fpider, having five piquila, has holes for above five thousand threads.

. Such is the tennity of the threads in the larger fort of fpiders. But if we examine the young produced by those, we shall find that they no fooner quit their ..., than they begin to fpin. Indeed their threads can fearer be perceived, but the webs may; they are ficquently as thick and close as those of house spiders; and no wonder, there being often four or five hundred little spiders concurring to the fare work. How minute must their holes be? the imagination can scarce conceive that of their papillæ! The whole spider is perhaps lefs than a papilla of the parent which produced it. But there are even fome kinds of fpiders for fmall at their birth, that they are not visible without a microscope. There are usually found an infinity of thefe in a cluster, and they only appear like a number of red points: And yet there are webs found under them, though well nigh imperceptible. What must be the tenuity of one of these threads? Mr Lecuwenhock has computed that 100 of the fingle threads of a full grown spider are not equal to the diameter of a hair of his beard; and confequently, if the threads and hair be both round, ten thousand such threads are not big. ger than such a hair. He calculates further, that when young spiders first begin to spin, four hundred of them are not larger than one which is of a full growth; allowing which, four millions of a young fpi-ВЬ

der's threads are not so big as the single hair of a man's beard.

Garden spiders, particularly the short legged species, yield a kind of filk, which has by some been judged scarce inferior to that of the filk worm. Mr Bon of Languedoc, about 70 years ago, contrived to manufacture from it a pair of filk stockings and mittens, of a beautiful natural gray colour, which were almost as handsome and strong as those made with common filk: and he published a differtation concerning the disco-But M. Reaumur, being appointed by the Royal Academy to make a farther inquiry into this new filk work, raifed feveral objections and difficulties against it, which are found in the Memoirs of the Academy for the year 1710. The fum of what he has urged amounts to this. The natural fierceness of the spiders renders them unfit to be bred and kept together. Four or five thousand being distributed into cells, fifty in fome, one or two hundred in others, the big ones foon killed and ate the lefs, fo that in a short time, there were fearce left one or two in each cell; and to this inclination of mutually eating one another M. Reaumur afcribes the fearcity of spiders, considering the vast number of eggs they lay.

But this is not all: he even affirms, that the fpider's bag is inferior to that of the filk worm both in luftre and strength, and that it produces less matter to be manufretured. The thread of the spider's web, he says, only bears a weight of two grains without breaking; and that of the bag bears thirty-fix. The latter, therefore, in all probability, is eighteen times thicker than the former; yet it is weaker than that of the filk werm, which bears a weight of two drachms and a half. So that five threads of the spider's bag must be put together to equal one thread of the filk worm's bag. Now it is impossible these should be applied so justly over one another as not to leave little vacant spaces between them, whence the light will not be reflected; and, of confequence, a thread thus compounded must fall short of the lustre of a solid thread. Add to this, that the fpider's thread cannot be wound off as that of the filk worm may, but must of necessity be carded; by which means, being torn in pieces, its evenness, which contributes much to its luftre, is deflroyed. In effect, this want of luftre was taken notice of by M. de la Hirc, when the flockings were prefented to the Academy. Again, Spiders furnish much less filk than the worms: the largest bags of these latter weigh four grains, the smaller three grains; so that 2304 worms produce a pound of silk. The spider bags do not weigh above one grain; yet when cleared of their dust and filth, they lose two-thirds of their weight. The work of twelve spiders, therefore, only equals that of one filk worm; and a pound of filk will require at least 27,648 spiders. But as the bags are wholly the work of the females, who spin them to deposite their eggs in, there must be kept 55,296 spiders to yield a pound of filk. Yet will this only hold of the best spiders; those large ones ordinarily seen in gardens, &c. searce yielding a twelfth part of the filk of the others. Two hundred and eighty of these, he shows, would not yield more than one filk worm; 663,552 of them would scarce yield a pound.

The act of generation among spiders varies in different species. As these insects prey upon each other

except during the time of their amours, they dare not Aranes. come within reach of one another but with the utmost > caution. They may fometimes be feen stretching out their legs, shaking the web, and tampering with each other by a flight touch with the extremity of their feet; then, in a fright, dropping hastily down their thread, and returning in a few moments to make fresh trial by feeling. When once both parties are well affured of the fex they have to deal with, the approaches of their feet, in order to feel, become more frequent, confidence takes place, and the inflant of amorous dalliance enfues. "We cannot," fays Lyonnet, "but admire how careful they are not to give themselves up blindly to a passion, or venture on an imprudent slep, which might become fatal to them." A caveat this to the human kind. Lifter and Lyonnet, two accurate observers, fay, that the extremity of those arms, or claws, which the spider uses to grasp his prey with, fuddenly opens, as it were by a fpring, and lets out a white body, which the male applies beneath the abdomen of the female to fulfil the wish of nature. In the water spider, the sexual organs are situated at the hinder parts of the male, are curved, and act as it were by a spring; those of the females are distinct. Nature by a thousand varied methods accomplishes her purpose.

Spiders frequently change their colour, which varies much, in respect to scason, sex, age, &c. but they are in general more beautifully variegated in autumn; a scafon not only the most opportune and plentiful respecting their prey, but the time when they arrive at their greatest magnitude, and are in their height of vigour-

The species of aranca enumerated by naturalists amount to upwards of 50; of which it may here suffice to mention a few of the most remarkable.

- 1. The calycina, with a round pale yellow belly, and two hollow points. It lives in the cups of flowers, after the flower leaves have fallen off; and catches bees, and other flies, when they are in fearch of honey.
- 2. The avicularia, has a convex round breatl, hollowed transversely in the middle. It is a native of America, and feeds upon small birds, insects, &c. The bite of this spider is as venomous as that of the scrpent.
- 3. The ocellata, has three pair of eyes on its thighs. It is about the same fize with the tarantula, of a pale colour, with a black ring round the belly, and two large black spots on the sides of the breast. It is a native of China.
- 4. The faccata, has an oval belly, of a dusky iron colour. It lives in the ground, and carries a fack with its eggs wherever it goes. This fack it glues to its belly, and will rather die than leave it behind.
- 5. Diadema is the largest spider which this country produces. The abdomen is of an oval form, downy, and of a ruddy yellow colour, which is very variable in different seasons; being sometimes paler, at others very dark coloured. The upper part is beautifully adorned with black and white circles and dots, having a longitudinal band in the middle, composed of oblong and oval-shaped pearl-coloured spots, so arranged as to resemble a fillet, similar to those worn by the eastern kings. The ground upon which this fillet and the white dots are laid, when viewed with a glass, and the sun shining thereon, is beautiful and rich beyond all description. There are varieties in colour of this spi-

Aranea der when young: some have their abdomen purple, ornamented with white dots, the legs yellow and annulated with a deeper colour; others have their abdomen of a fine red likewise ornamented with white, but the legs of a fine pale green colour; annulated with dark purple or black. It inhabits the birch tree.

6. The cucurbitina, has a globular yellow belly, with a few black spots. It lives in the leaves of trees, and

encloses its eggs in a foft net.

7. The labyrinthica, with a dusky oval belly, a whitish indented line, and a forked anus. The web of this species is horizontal, with a cylindrical well or tube in the middle.

8. The fimbriata, has a black oblong belly, with a white line on each fide, and dusky coloured legs. It lives in water, upon the furface of which it runs with great swiftness.

9. The holosericea, has an ovalish belly covered with a down like velvet; at the base, or under part, it has two yellow spots. It is found in the folded leaves of

- 10. The viatica, or wanderer, is generally of a yellow colour more or less deep. Sometimes it is whitish and even rather green. The abdomen is large, broad, almost square, with two bands of dark orange, which arifing from the thorax descend obliquely on the sides towards the middle. Between the bands are a few small black dots forming a kind of triangle upon the middle of the abdomen. On the thorax are feen two longitudinal bands fomewhat green, one on each fide. The two foremost pair of legs are very long, and the hinder short; which makes it walk like a crab. It is found upon plants; and is a lively, active, indefatigable hunter. Without any motion of the head, which is furnished with immoveable eyes, it perceives all the flies that hover round about, does not scare them, but firetches over them its arms furnished with feathers, which prove nets in which their wings entangle. It is faid to fit on its eggs; which however it often carries about with it, wrapt up in a ball of white filk.
- 11. The aquatica, is of a livid colour, with an oval belly, and a transverse line, and two hollowed points. It frequents the fresh waters of Europe. But it is in fome fort amphibious: for it can live on land as well as in the water, and comes often on shore for its food; yet it swims well in water, both on its belly and back: it is distinguishable by its brightness. In the water its belly appears covered with a filver varnish, which is only a bubble of air attached to the abdomen by means of the oily humours which transpire from its body, and prevent the immediate contact of the water. This bubble of air is made the substance of its dwelling, which it constructs under water: for it fixes several threads of filk, or fuch fine matter, to the stalks of plants in the water; and then ascending to the surface, thrusts the hinder part of its body above water, drawing it back again with fuch rapidity, that it attaches underneath a bubble of air, which it has the art of detaining under water, by placing it underneath the threads above mentioned, and which it binds like a covering almost all around the air-bubble. Then it ascends again for another air-bubble; and thus proceeds until it has constructed a large aërial apartment under water, which it enters into or quits at pleasure. The male constructs for himself one near to the semale; and when

love invites, he breaks through the thread walls of the Aranea. female's dwelling, and the two bubbles attached to the bellies of both unite into one, forming one large nuptial chamber. The female is fometimes laid for a whole day together stretched on her back, waiting for the arrival of the male, without motion, and feemingly as if dead. As foon as he enters and glides over her, the feems to be brought to life again, gets on her legs and runs after the male, who makes his escape with all posfible speed. The female takes care of the young, and constructs similar apartments on purpose for them. The figure of this spider has nothing remarkable; and would be overlooked among a crowd of curiofities, if the spectator be unacquainted with its fingular art of confiructing an acrial habitation under water, and thus uniting together the properties of both elements. It lodges during the winter in empty shells, which it dexterously shuts up with a web.

12. The fasciata, with yellow bands round the belly, and dusky rings on the legs, is a native of Barbary, and is as large as the thumb. It inhabits hedges and thickets: its webs have large methes, and it relides in the centre. The fnares are spread for large flies, wasps, drones, and even locuste: the lesser infects can escape through the methes. The animal which it entangles is foon bound with firong threads; killed by the finder's jaws; and partly eat, if the folder is hungry: the red is concealed under fome neighbouring dry leaves, covered with a kind of web and a blackish glue in great abundance. Its larder is faid to be often plentifully stored: -Its neit is of the fize of a pigeon's egg, divided horizontally, and suspended by the threads of the infect, which are of a filvery white, and stronger than filk. The young ones live in amity; but when grown up, are They never meet but they fight mortal enemies. with violence, and their battle only ends with the death of the weakest. The dead body is carefully stored in the larder. Twelve of these spiders, by way of experiment, were thut up together; and, after a battle of eight days, the strongest only remained alive. 13. The tarantula, has the breast and belly of an ash-

colour; the legs are likewife ash-coloured, with black-Plate XV. ish rings on the under part; the fangs or nippers are (in Vol. I) red on the inner fide, the rest being blackssh: Two of its eyes are larger than the other, red, and placed in the front; four other eyes are placed in a transverse direction towards the mouth; the other two are nearer the back: It has two antennæ or feelers. It is a native of Italy, Cyprus, Barbary, and the East Indics. It lives in bare fields, where the lands are fallow, but not very hard; and from its antipathy to damp and shade, chooses for its residence the rising part of the ground facing the east. Its dwelling is about four inches deep, and half an inch wide; at the bottom it is curved, and there the infect fits in wet weather, and cuts its way out if water gains upon it. It weaves a net at the mouth of the hole. These spiders do not live quite a year. In July they shed their skin, and proceed to propagation; which, from a mutual distrust, as they frequently devour one another, is a work undertaken with great circumspection. They lay about feven hundred and thirty eggs, which are hatched in the fpring; but the parent does not live to fee her progeny, having expired early in the winter. The ichneumon fly is their most formidable enemy.

The bite of the tarantula is faid to occasion an inflammation in the part, which in a few hours brings on fickness, difficulty of breathing, and universal faintness. The person afterwards is affected with a delirium, and sometimes is seized with a deep melancholy. The fame symptoms return annually, in some cases, for several years; and at last terminate in death. Music, it has been pretended, is the only cure. A musician is brought, who tries a variety of airs, till at last he hits upon one that urges him to dance; the violence of which exercise produces a proportionable agitation of the vital spirits, attended with a consequent degree of perspiration, the certain consequence of which is a cure. Such are the circumstances that have been generally related, and long credited, concerning the bite of this animal. Kircherus, in his Musurgia, gives a very particular account of the fymptoms and cure, illustrated by histories of cases. Among these, he mentions a girl, who, being bitten by this infect, could be cured only by the music of a drum. He then proceeds to relate, that a certain Spaniard, trusting to the efficacy of music in the cure of the frenzy occasioned by the bite of the tarantula, submitted to be bitten on the hand by two of these creatures, of different colours, and possessed of disterent qualities. The venom was no fooner diffused about his body, than the symptoms of the disorder began to appear; upon which harpers, pipers, and other mulicians, were fent for, who by various kinds of music endcavoured to rouse him from that stupor into which he was failen: but here it was observed that the bites of the two infects had produced contrary effects; for by one he was incited to dance, and by the other he was reftrained therefrom; and in this conflict of nature the patient expired. The same account is given in his Phonurgia Nova, with the addition of a cut representing the infect in two positions, the pa-

the cure was effected. In his Musurgia, this author, attempting mechanically to account for the cure of the bite of the tarantula by mulic, lays of the poison, That it is sharp, gnawing, and bilious; and that it is received and incorporated into the medullary substance of the fibres. With respect to the music, he says, That the founds of chords have a power to rarefy the air to a certain harmonical pitch; and that the air thus rarefied, penetrating the pores of the patient's body, affects the mufcles, arteries, and minute fibres, and incites him to dance; which exercise begets a perspiration, in which the poison evaporates.

tient in the action of dancing, together with the musical notes of the tune or air by which in one instance

Unfatisfactory as this theory appears, the belief of this strange phenomenon has prevailed among the ablest of modern phyticians. Sir Thomas Brown, so far from disputing it, says, That since many attest the fact from experience, and that the learned Kircherus hath pofitively averred it, and fet down the fongs and tunes folemnly used for the cure of the disease, and fince some also assirm that the tarantula itself will dance at the found of mutic, he shall not at all question it *.

Farther, That eminent Italian physician of the last . III. c. 28. century, Baglivi, a native of Apulia, the country where the tarantula is produced, has written a differtation De Anatomia, Morfu, et E Jectibus Tarantule. In this he describes the region of Apulia where the tarantula is

produced, with the anatomy and figure of the infect Aranea. and its eggs, illustrated by an engraving; he mentions particularly the fymptoms that follow from the bite, and the cure of the disease by music, with a variety of histories of cures thus wrought, many of them communicated by persons who were eye witnesses of the

Ludovicus Valetta, a Celestine monk of Apulia, published at Naples, in the year 1706, a treatise upon this spider, in which he not only answers the objections of those who deny the whole thing, but gives, from his own knowledge, feveral inflances of persons who had fuffered this way, some of whom were of great families, and so far from being dissemblers, that they would at any rate, to avoid shame, have concealed the misfortune which had befallen them.

The honourable Mr Robert Boyle, in his treatife of Languid and Unheeded Motions, speaking of the bite of the tarantula, and the cure of the discase which follows it by means of music, says, That, having himself had some doubts about the matter, he was, after strict inquiry, convinced that the relations in the main were

Lastly, Dr Mead, in his Mechanical Account of Poisons, has given an essay on the tarantula, containing the fubiliance of the above relations, which he endcavours to confirm by his own reasoning thereon.

Notwithstanding the number and weight of these authorities, and the general acquiefcence of learned and ingenious men in the opinion that the bite of the tarantula is poisonous, and that the cure of the disorder occasioned by it is effected by music, we have reason

to apprehend that the whole is a mistake.

In the Philosophical Transactions for the year 1672, p. 406, is an extract of a letter from Dr Thomas Cornelio, a Neapolitan physician, to John Doddington, Esq; his majesty's resident at Venice, communicated by the latter, in which, speaking of his intention to send to Mr Doddington fome tarantulas, he fays, " Meanwhile I shall not omit to impart to you what was related to me a few days fince by a judicious and unprejudicate person; which is, that being in the country of Otranto, where those insects are in great numbers, there was a man who, thinking himself stung by a tarantula, showed in his neck a small speck, about which in a very fhort time there arose some pimples full of a ferous humour; and that, in a few hours after, the poor man was forely afflicted with very violent fymptoms, as syncopes, very great agitations, giddiness of the head, and vomiting; but that, without any inclination at all to dance, and without a defire of having any musical instruments, he miserably died within two days. The same person affirmed to me, that all those that think themselves bitten by tarantulas, except such as for evil ends feign themselves to be so, are for the most part young wanton girls, whom the Italian writers call Dolei di Sale; who, by fome particular indifposition falling into this melancholy madness, persuade themselves, according to the vulgar prejudice, they have been flung by a tarantula."

Dr Serao, an Italian physician, has written an ingenious book, in which he has effectually exploded this opinion as a popular error; and in the Philofophical Transactions, No LX. for the year 1770, p. 236. is a letter from Dominico Cirillo, M. D. pro-

feffor

Inquiries to Yulgar

Aranes fessor of natural history in the university of Naples, wherein, taking notice of Serao's book, he says, That having had an opportunity of examining the effects of this animal in the province of Taranto, where it is found in great abundance, he finds that the furprising cure of the bite of the tarantula by music has not the least truth in it; and that it is only an invention of the people, who want to get a little money by dancing when they fay the tarantism begins. He adds, " I make no doubt but fometimes the heat of the climate contributes very much to warm their imaginations, and throw them into a delirium, which may be in some meafure cured by music; but several experiments have been tried with the tarantula; and neither men nor animals after the bite have had any other complaint than a very trifling inflammation upon the part, like that produced by the bite of a scorpion, which goes off by itfelf without any danger at all. In Sicily, where the fummer is still warmer than in any part of the kingdom of Naples, the tarantula is never dangerous; and music is never employed for the cure of the pretended tarantifm."

> Mr Swinburne, when in the country of the tarantula, was defirous of investigating minutely every particular relative to that infect; but the season was not far enough advanced, and no tarantati (persons bitten, or pretending to be bitten, by the tarantula) had begun to ttir. He prevailed, however, upon a woman who had formerly been bitten, to act the part, and dance the tarantata before him. A great many mulicians were fummoned, and she performed the dance, as all present affured him, to perfection. At first she lolled stupidly on a chair, while the inftruments were playing some dull music. They touched, at length, the chord supposed to vibrate to her heart; and up she sprang with a most hideous yell, staggered about the room like a drunken person, holding a handkerchief in both hands, raifing them alternately, and moving in very true time. As the music grew brisker, her motions quickened, and the skipped about with great vigour and variety of steps, every now and then shricking very loud. The scene was far from pleasant; and, at his desire, an end was put to it before the woman was tired. Wherever the tarantati are to dance, he informs us, a place is prepared for them, hung round with bunches of grapes and ribbons. The patients are dreffed in white, with red, green, or yellow ribbons, for those are their favourite colours; on their shoulders they cast a white scarf, let their hair fall loofe about their ears, and throw their heads as far back as they can bear it. They are exact copies of the ancient priestesses of Bacchus. The orgies of that god, whose worship, under various symbols, was more widely spread over the globe than that of any other divinity, were no doubt performed with energy and cuthufiasm by the lively inhabitants of this warm climate. The introduction of Christianity abolished all public exhibitions of these heatherish rites, and the women durst no longer act a frantic part in the character of Bacchantes. Unwilling to give up fo darling an amusement, they devised other pretences; and possession by evil spirits may have furnished them with one. Accident may also have led them to a difcovery of the tarantula; and, upon the fireigth of its poison, the Puglian dames still enjoy their old dance, though time has effaced the memory of its ancient

name and inftitution; and this Mr Swinburne takes to be Aronea, the origin of fo strange a practice. If at any time these Aranjues dancers are really and involuntarily affected, he suppofes it can be nothing more than an attack upon their nerves, a species of St Vitus's dance; and he inclines the more to the idea, as there are numberless churches and places throughout these provinces dedicated to that saint.

Many fenfible people of the country, however, differ in opinion from Dr Serao and other authors, who have ridiculed the pretended diforder, and affirmed that the venom of this species of spider can produce no effects but fuch as are common to all others. The Brinditians fay, that the tarantulas fent to Naples for the experiment were not of the true fort, but a much larger and more innocent one; and that the length of the journey, and want of food, had weakened their power fo much, as to fuffer the Doctor or others to put their arm into the bag where they were kept with impunity. They quote many examples of persons bitten as they flept out in the fields during the hot months, who grew languid, stupid, deprived of all courage and elasticity, till the found of some favourite tune roused them to dance, and throw off the poison. These arguments of theirs, however, Mr Swinburne thinks of little weight : for they acknowledged that elderly perfons were more frequently infected than young ones; and that most of them were women, and those unmarried. No person above the lowest rank in life was ever seized with this malady, nor is there an inftance of its caufing death. The length of the dance, and the patient's powers of bearing fuch excessive fatigue in the canicular season, prove nothing: because every day, at that time of the year, peafants may be feen dancing with equal spirit and perseverance, though they do not pretend to be seized with the tarantism. The illness may therefore be attributed to hysterics, excessive heat, stoppage of perspiration, and other effects of fleeping out of doors in a hot fummer air, which is always extremely dangerous, if not mortal, in most parts of Italy. Violent exercise may have been found to be a certain cure for this diforder, and continued by tradition, though the date and circumstances of this discovery have been long buried in oblivion; a natural passion for dancing, imitation, custom of the country, and a defire of raising contributions upon the spectators, are probably the real motives that inspire the tarantati. Before Scrao's experiments, the tarantula had been proved to be harmless from trials made in 1693 by Clarizio, and in 1740 at Lucera by other naturalits.

ARANJUEZ, a town in the province of New Castile, where the king of Spain has a palace and gardens which are reckoned the most delightful in the world.

This place is 20 miles from Madrid, by a noble road, planted on each fide with trees, lately made at the expence of 120,000l. sterling. It is delightfully fituated at the conflux of the rivers Tagus and Jarama: which run through the gardens, and add new beauty to this charming spot, where art and nature feem to go hand and hand with the most pleasing and rural famplicity. On one fide, fine avenues of stately oaks and lofty elms convey the truest ideas of magnificence, while they afford the most reviving shade; on the other, the fudden transitions to lawns and wildernels, the calcades of water breaking through the thickets, the tuneful fongs of numberless birds sheltered in these cool recesses, the occasional appearance and pasfage of the monarch attended by the grandces of his kingdom; all these objects united, and concentred in one point, fill the imagination with pleasing ideas, and imprefs the mind of a traveller with a thousand agreeable sensations.

The general fituation is in a very large plain furrounded with large hills, of a most disagreeable aspect indeed, but feldom appearing, being well hidden by the noble rows of trees that extend across the flat in every direction. The main body of the palace is an old building, to which have been lately added two new wings. The first part of the building was erected by Philip II. who purchased the estate, planted many of the avenues, and, in order to extend his chase, or to indulge his splenetic disposition, had all the vines that grew on the hills rooted up. By that means he drove away the inhabitants, and rendered the environs of his villa a perfect desert .- The apartments are good; but contain nothing very particular to take off from the enjoyment of so many fine objects abroad. In one of the new wings is a playhouse, and in the other a chapel. Part of the cicling of the former was painted by Mengs, who was also fent to Rome to paint a holy family for the principal altar in the chapel. There are feven fine pictures of Luca Jordano in the apartment called El Cabinete Antiguo, and fix others in that De los Mayordomos. The portraits of the grand duke and duchels of Tulcany, by Mengs, are in a new apartment called the king's dreffing room. In the chapel, over the great altar, there is a fine picture of the Annunciation, by Titian, presented by him to Charles V. and brought from the convent of Juste, after the death of that emperor. The porcelain cabinet, where there are several large pieces of the king's own manufactory, is also an object of curiofity to a traveller.

As to the gardens, the whole of them may be thrown into three grand divisions, distinguished by the names of La Huerta Valenciana, Los Deleites, and El Cortijo. In the Huerta Valenciana, agriculture and gardening are carried on in the fame manner as in that fruitful province, and they plough with horses. In the Cortijo they use oxen, as in Andalusia; and in other places they feratch up the ground with mules, as is still practifed in some parts of Spain. Whichever way one looks round, a constant variety pleases the eye, and enraptures the mind. At one moment the flurdy buffalo moves before you, drawing his heavy burden; foon after, the flow camel, with his ponderous load; while the swift zebra with his striped garment frisks over the plains. If you approach the farm, every object of convenience is consulted, and in the dairy every degree of neatness. The Dutch cow enjoys a luxuriant pasture, the brood mares greatly enliven the landscape, and the stables are filled with the most excellent horses; and an immense nursery furnishes all manner of trees and plants. The fine avenue, which ferves also for a public walk, called Calle de Reyna, has nothing equal to it at Verfailles. It is three miles long, quite ftraight from the palace gate, croffing the Tagus twice before it loses itself in the thickets, where some noble fpreading elms and weeping poplars hang beautifully over the deep still pool. Near this road is a flower

garden for the spring, laid out with great taste by Mr Aranjues, Wall during his ministry. The gay variety of flowers Arar. at this time of year is particularly pleasing to the eye; but its beauty foon fades on the approach of fummer. As the weather grows hot, the company that choose to walk retire to a garden in an island of the Tagus. on the north fide of the palace. This is a heavenly place, cut into various walks and circular lawns, which in their primitive state may have been very stiff and formal: but in the course of a century, Nature has obliterated the regular forms of art; the trees have fwelled out beyond the line traced for them, and destroyed the enfilade by advancing into the walks or retiring from them. The sweet flowering shrubs, instead of being clipped and kept down, have been allowed to shoot up into trees, and hang over the statues and fountains they were originally meant to ferve as humble fences to. The jets-d'eau dash up among the trees, and add fresh verdure to the leaves. The terraces and balustrades built along the river, are now overgrown with roles, and other luxuriant bushes, hanging down into the stream, which is darkened by the large trees growing on the opposite banks. Many of the statues, groupes, and fountains, are handsome, some masterly, the works of Algardi: all are placed in charming points of view, either in open circular spots, at a distance from the trees, or else in gloomy arbours, and retired angles of the wood. The banks of this wood, called the Ila, are also enlivened by elegant yachts for the amusement of the royal family.

The town or village formerly confifted of the palace, its offices, and a few miferable huts, where the ambassadors, and the attendants of the court, endeavoured to lodge themselves as well as they could, but always very uncomfortably; many of the habitations were vaults half under ground. What determined the king to build a new town, and to embellish the environs, was an accident that happened at the nuncio's; a coach broke through the cieling of his dining-room, and fell in upon the table. The court then began to apply very confiderable fums to the purpole of erecting proper dwellings for the great number of persons that flock to the place where the fovereign refides; near 10,000 are supposed to live here two or three months in spring; the king keeps 115 sets of mules, which require a legion of men to take care of them. Above a million sterling has been laid out at Aranjuez since the year 1763; and it must be acknowledged, that wonders have been performed: several fine streets drawn in straight lines with broad pavements, a double row of trees before the houses, and a very noble road in the middle; commodious hotels for the ministers and ambassadors; great squares, markets, churches, a theatre, and an amphitheatre for bull feafts, have been raifed from the ground; besides the accession of two new wings to the palace. Neatness and convenience have been more studied and fought for than show in the architecture, but altogether the place has fomething truly magnificent in the coup d'æil.

ARAR, (Czsfar, Strabo); Araris, (Dio Cassius); Saucona, (Ammian): A river of Celtic Gaul, now the Saone; which rifes out of Mount Vogefus on the confines of Lorrain, runs through the Franche Comte and Burgundy, and below Lyons falls into the Rhone. It is so incredibly slow, that the eye cannot distinguish Ararat which way it moves, (Czesar); and therefore Pliny calls it the Slaggifb river. Its course is from north to fouth. It is famous for a bridge of Czefar, which was built by the foldiers in one day. It is navigable equally with the Rhone.

ARARAT, the name of the mountain on which Noah's ark rested, after the abatement of the waters of the universal deluge. Concerning this mountain there are various conjectures; though it is almost univerfally allowed to be in Armenia Major. Some are of opinion that it is one of the mountains which divide Armenia on the fouth from Mesopotamia and that part of Assyria inhabited by the Curds; from whom these mountains took the name of Curdu or Cardu, by the Greeks turned into Gordyei, &c. Others, that it lies towards the middle of Armenia, near the river Araxes, above 280 miles distant from the above-mentioned mountains, making it belong to Mount Taurus; but the Armenians are positive that Noah's Ararat is no other than a mountain to which they now give the name of Mass, which lies about 12 leagues to the east of Erivan, and four leagues from the Aras. It is encompaffed by feveral petty hills: on the tops of them are found many ruins, thought to have been the buildings of the first men, who were, for some time, afraid to descend into the plains. It stands by itself, in form of a sugarloaf, in the midit of a very large plain, detached, as it were, from the other mountains of Armenia, which make a long chain. It consists, properly speaking, of two hills; the leffer of which is the more fharp and pointed: the higher, on which it is faid the ark rested, lies to the north-west of it, and rises far above the neighbouring mountains. It feems fo high and big, that, when the air is clear, it may be feen four or five days journey off; yet travellers think the height is not extraordinary. Chardin is of opinion that he paffed a part of Mount Caucasus which is higher; and Poullet thinks the height of Mount Masis, or Ararat, not above twice as great as that of Mount Valerian near Paris. They therefore think that its being visible at such a great distance is owing to its lonely situation in a vast plain and upon the most elevated part of the country, without any mountains before it to obstruct the view. Nor is the fnow with which it is always covered from the middle upwards any argument of its height; for in this country, ice hath often been observed in the mornings of the middle of July. (See ARMENIA). Certain it is, however, that this mountain hath never yet been ascended; which the Armenians pretend was owing to the interposition of angels, in order to disappoint the curiofity of those who wanted to advance to fuch a facred place as that whereon the ark rested : but the excess of cold may very reasonably be supposed able to frustrate all fuch attempts, without any supernatural interpolition. The most distinct account we have of this mountain is that given by M. Tournefort: which, however, being much swelled with immaterial circumstances, it is needless to trouble our readers with He tells us, that this mountain is one at length. of the most disagreeable fights upon earth, without either houses, convents, trees, or shrubs; and seems as if continually wasting and mouldering away. He divides it into three regions: The lowermost, he says, is the only one which contains any human creatures, and is occupied by a few miserable shepherds that tend scab-

by flocks; and here are also found some partridges; Ararat, the second is inhabited by crows and tigers; and all Arstus. the rest is covered with snow, which half the year is involved in thick clouds. On the fide of the mountain that looks toward Erivan is a prodigious precipice, from whence rocks of an immense fize are continually tumbling down with a hideous noise. This precipice feems quite perpendicular; and the extremities are rough and blackish, as if smutted with smoke. The foil of the mountain is loofe, and on the fandy parts it is impossible to take a firm step; so that our traveller encountered great difficulties in his afcent and descent of this mountain; being often obliged, in order to avoid the fand, to betake himself to places where great rocks were heaped on one another, under which he passed as through caverns, or to places full of stones, where he was forced to leap from one stone to another. If we may believe Struys, a Dutch writer, however, all these difficulties may be surmounted. He assures us, he went five days journey up Mount A. rarat, to see a Romish hermit: that he passed through three regions of clouds; the first dark and thick, the next cold and full of fnow, and the third colder still: that he advanced five miles every day; and when he came to the place where the hermit had his cell, he breathed a very ferene and temperate air; that the hermit told him, he had perceived neither wind nor rain all the 25 years he had dwelt there; and that on the top of the mountain there still reigned a greater tranquillity, whereby the ark was preferved uncorrupt-He farther pretends, that the hermit gave him a cross made out of the wood of the ark, together with a certificate; a formal copy of which the author has given in his sham relation.

ARASSI, a maritime, populous, and trading town of Italy, in the territory of Genoa. E. Long. 7. 20.

N. Lat. 44. 3. ARATEIA, in antiquity, a yearly festival celebrated at Sicyon, on the birth day of Aratus, wherein divers honours were paid by a priest confecrated to this service, who for distinction's sake wore a ribband bespangled with white and purple spots. The Arateia were folemnized with much pomp of music, the choristers of Bacchus attending.

ARATUS, general of the Achazans, conquered Niocles tyrant of Sicyon. Two years after he furprifed the castle called Acrocorinthus, and drove out the king of Macedonia: he delivered Argos from its tyrants, and was poisoned by Philip II. king of Macedonia, whom he had newly restored. He was about 62 when he died, the second year of the 141st Olympiad. He was interred at Sicyon, and received the greatest honours from his countrymen. His fon, who had also been przetor, was poisoned by King Philip. Polybius gives us so great a character of Aratus the father's Commentaries or History, that the loss of so valuable a work is highly to be regretted.

ARATUS, a Greek poet, born at Soli, or Solæ, a town in Cilicia, which afterwards changed its name, and was called Pompeioplis, in honour of Pompey the Great. He flourished about the 124th, or according to some, the 126th Olympiad, in the reign of Ptolemy Philadelphus king of Egyp'. He discovered in his youth a remarkable poignancy of wit, and capacity for improvement; and having received his education under Dionyhus Heracleotes, a Store philosopher, he espoused the principles of that sect. Aratus was phyfician to Antigonus Gonatus, the fon of Demetrius Poliorcetes, king of Maccdon: this prince, being a great encourager of learned men, fent for him to court, admitted him to his intimacy, and encouraged him in his studies. The Phenomena of Aratus, which is still extant, gives him a title to the character of an aftronomer as well as a poet; in this piece he describes the nature and motion of the stars, and shows the particular influences of the heavenly bodies, with their various difpositions and relations. He wrote this poem in Greck verse: it was translated into Latin by Cicero; who tells us, in his first book De Orature, that the verses of Aratus are very noble. This piece was translated by others as well as Cicero; there being a translation by Germanicus Cælar, and another into elegant verse by Festus Avienus. An edition of the Phenomena was published by Grotius, at Leyden, in quarto, 1600, in Greek and Latin, with the fragments of Cicero's version, and the translations of Germanicus and Avienus; all which the editor has illustrated with curious notes. He was certainly much esteemed by the ancients, since we find fo great a number of scholials and commenta-tors upon him. There are several other works also afcribed to Aratus. Suidas mentions the following: Hymns to Pan; Astrology and Astrothesy; a compofition of Antidotes, an Emilorizer on Theopropus; an Heroux on Antigonus; an Epigram on Phila, the daughter of Antipater, and wife of Antigonus; an Epice-

line of the Phanomena of Aratus. ARAVA, a fortress of Upper Hungary, in a county and on a river of the same name. E. Long. 20. 0. N. Lat. 49. 20.

dium of Cleombrotus; a Correction of the Odyssey;

and some Epistles in profe. Virgil, in his Georgies,

has imitated or translated many passages from this au-

thor; and St Paul has quoted a passage of Aratus.

It is in his speech to the Athenians (Acts xvii. 28.)

wherein he tells them, that some of their own poets

have faid, Tou yas xas yeres somes: " For we are also his

offspring." These words are the beginning of the fifth

ARAUCO, a fortress and town of Chili, in South America; fituated in a fine valley, on a river of the fame name. The natives are fo brave, that they drove the Spaniards out of their country though they had no fire arms. W. Long. 51. 20. S. Lat. 42. 30.

ARAUSIO, or Civitas Araufienfis, or Arauficorum (Notitiæ); Colonia Secundanorum (Mela, Pliny, Coins); fo called, because the veterans of the second legion were there fettled: The capital of the Cavares, in Gallia Narbonenfis. Now Orange, in the west of Provence, on an arm of the rivulet Egue, which foon after falls into the Rhone, from which it is distant a league to the call, at the foot of a mountain. Here is an ancient amphitheatre to be fill feen. E. Long. 4. 46. Lat. 44. 10.

ARAW, a town of Swifferland, in Argow, seated on the river Aar. It is handfome, large, and remarks able for its church, its fountain, and the fertility of the foil. E. Long. 18. o. N. Lat. 47. 25.

ARAXES, now the Aras, a river of Armenia Major, which takes its rife in a mountain called Albos, where the Euphrates also hath its origin. From this mountain it runs cultward with a serpentine course, dif- Arba. charging itself into the Caspian sea, after a run of upwards of 500 miles, during which it receives some coufiderable rivers. Some have imagined that it buth its rife in Mount Ararat; but Tournefort affures us that it comes no nearer that mountain than 12 miles. The Araxes is a very rapid river, and is supposed to be the Gihon mentioned by Moses. Besides this extreme rapidity, it is very apt to overflow after rains; fo that they have in vain endeavoured to build bridgesoverit; though fome of them appear, from the few arches remaining, to have been built of the best materials, and in the strongelt manner. Such is the vehemence of its current after the thawing of the adjacent snows, or some fierce rains, that neither banks nor dykes can refift it; fo that nothing can be more terrible than the noise and violence of its waves at fuch times: but in winter, when its waters are low, it is fordable in some places on camels.

ARBA (anc. geog.), an island and city of Illyria, now Arbe, in the gulf of Quarnaro. Of this island, which has been but flightly noticed by geographers, we have the following description by the Abbé Fortis.

In the Roman times, it is probable that there were no other cities in Arbe but that which bears the name of the island, in the neighbourhood of which ancient monuments are frequently dug up.

This city of Arbe, though the capital of a small island, not above thirty miles round, wholly uncultivated, and unhabitable in the highest part that faces the channel of Morlacca, has always maintained itself with decorum. That it was inhabited by civilized people in the Roman times, is evident, by the inferiptions that have been frequently discovered there, and others fill remaining at Arbe. In the lower times it fuffered all the calamities to which the neighbouring countries were subjected, but it always recovered itself with honour even after diffolution.

The archives of the community of Arbe contain fome ancient papers that are truly valuable, and they are kept with great jealoufy; by them it appears, that, in the eleventh century, gold and filk were not rare among the inhabitants. Arbe was subject to the kings of Hungary; afterwards it became dependent on Venetian feudatories; and at last was taken under the immediate dominion of the most ferenc republic, by which a governor is appointed who has the title of count and captain. The number of people on the island does not much exceed three thousand souls, distributed in a few parishes, which might be officiated by a small number of priests: Yet, through a monstrous inconfiftency that falls very heavy on the poor inhabitants, they have to maintan no less than three convents of friars, and as many of nuns, belides the confiderable charge of near fixty priefts, who have a very scanty provision.

The climate of Arbe is none of the happiest; the winter feafon is horrid, especially when agitated by the violent northerly winds, which fometimes transform the intermediate feafons into winter, and cause the summer itself to disappear. These furious winds do great damage to the island, particularly in the winter and fpring. Two years ago, about twelve thousand sheep perished in one night, of cold, in the common pastures of the mountain; where, according to the cuArba. tom over all Dalmatia, they are left in the open air the whole year round. The falt fog raifed by the dreadful commotion of the waves, which often roar, between the mountains of Arbe and the opposite Alps, in the narrow channel of Morlacca, confumes all the buds of the plants and corn, if it happens to be driven upon the island by the wind; and it is followed by a cruel fearcity of every kind of product. This calamity communicates its baneful influence even to the fich of the animals left on the pastures, that becomes ill tasted, in consequence of the bitterness and bad nourithment of the food. Abstracting from these irregularities, the air of Arbe is healthful; nor ought the constant summer severs among the inhabitants to be attributed to its influence, as they are, more probably, derived from unwholesome food, and a way of life differing little from that of the Hottentots.

The appearance of the island is exceedingly pleasant. On the east it has a very high mountain, of the same fubflance as the Morlacca, of which it was once a part. At the foot of this mountain, the rest of the island is extended to the wellward, and divided into beautiful and fruitful plains interspersed with little hills fit to bear the richest products. At the extremity that looks to the north, a delightful promontory, called Loparo, stretches into the sea; it is crowned with little hills, which almost quite enclose a fine cultivated plain. Near this promontory are the two small islands of S. Gregorio and Goli, very useful to shepherds and fishers. The coast of Arbe, that faces the Morlacca mountains, is quite steep and inaccessible; and the channel between them is extremely dangerous, being exposed to furious winds, and without a fingle port on either fide. The long and narrow island of Dolin, lying parallel to the island of Arbe, along the coast of Barbado, forms a channel less dangerous, though by no means fo fecure as it is beautiful to look at. There are feveral harbours in the neighbourhood of the city of Arbe, by which the trade of the best part of the

The city stands on a rising ground between two harbours, which form a peninfula; it contains about a thousand inhabitants, among whom are many noble families, but few of them are rich. Among the most remarkable curiofities of the island, the Arbegiani are proud of many egregious relicks, and particularly of the head of S. Cristofano their protector; but the lovers of facred antiquity will find fomething much more fingular in the three heads of Shadrach, Meshech, and Abednego, which are venerated there with great devotion. Four of the principal gentlemen are keepers of the fauctuary, and to their care the precious records of the city are also committed. Among these records there is a transaction of MXVIII, by which the city of Arbe promises to the doge of Venice, Ottone Orseolo, a tribute of some pounds de feta serica, "of wrought filk," and in case of contravention, pounds de auro obrizo, " of pure gold."

island is facilitated.

In the last age there was a learned bishop of Arbe, named Ottavio Spaderi, who would not permit the relicks of S. Cristofano to be exposed to the public veneration, on the folemnity of the faint's day, because he doubted of their authenticity. The mob role, and was going to throw him down from the top of the hill on which the cathedral stands; nor did the tumult

Vol. II. Part I.

cease after the day was past. The government sent Arbaces. an armed vessel to deliver the prelate from the danger he was in; and the Pope thought proper to give him a more tractable spouse in Italy.

The nature of the foil of Arbe is not the same in every fituation; nay it would be difficult to find a country where there is fo great a variety in fo little space. There is a very great difference between the ground of the extremity of the mountain above the channel of Barbado, and the fides of it on the one part towards the island, and on the other facing the ridge of Morlacca. Nor is the top of the mountain itself always of the same structure: for in some parts it is extended in a sine level plain, partly woody and partly cultivable; in other places it is quite rocky, and composed of bare marble. The ground at the foot of the mountain, where it stretches towards the shore, opposite to Jablanaz, is nothing but marble; and, in the diffrict of Barbado it is gravelly, and a good foil for vines. The wine of Barbado is of excellent quality, and in great estimation; hardly any other product is cultivated along that coast, as the vines succeed so well, notwithstanding the negligent culture. Below the pretended ruins of Colento the land bears vines, olives, mulberry, and other fruit trees, and also corn in the lowest parts. All the lower part of the island is composed alternately of little hills and valleys, and of a substance for the most part very different from that of the mountain and its adjacencies. As the organization of the mountain is wholly of marble, fo that of the hills is generally arcnaccous. The whetstone forms a large part, and frequently contains oftracites and lenticulares; the exterior fratum is commonly friable. The valleys, which according to appearances should be full of fand, are provided with an excellent foil, with fuch a mixture of very minute fand as is requifie to keep it light. Springs of freth water are by nature well distributed over the island, and maintain a proper humidity when the fummer is not excessively dry; so that the dark verdure of the hills covered with wood, the luxuriance of the vines, and freshness of the corn ground, form a fpectacle extremely cheerful and agrecable.

The island of Arbe would have every thing requifite for the subfiftence of its small population, if the land was cultivated by a people less stupid and lazy. It produces, however, firewood, of which many cargoes are annually fent to Venice; corn, oil, excellent wine, brandy, and filk, fince very ancient times; it also exports hides, wool, sheep, hogs, and horses of a good breed. There is also abundance of good falt made on the island; and the fishing of tunny and mackerel, notwithstanding it is managed in a slovenly and awkward manner, makes no inconfiderable article of trade to the Arbegiani, who, like all their neighbours, find their account in felling this commodity to strangers rather than to the Venetians. Yet, with all these natural products, the island is very far from being rich, or even in a tolerably flourishing state; because there is much land left

uncultivated, and the peafants are lazy

ARBACES governed Media under Sardanapalus. Seeing him spinning among a company of his women, he stirred up his people to revolt, and dethroned Sardanapalus; who thereupon burnt himself in his palace. Arbaces being crowned, began the monarchy of the Medes, which lasted 317 years under nine kings, till Aftyages

Allyages was expelled by Cyrus. Arbaces reigned 22 years, and died A. M. 3206. See MEDIA.

ARBALEST, or Cross Bow. See Cross Bow. ARBELA, now IRBIL, a city of Affyria, lying in E. Long. 44. 5. N. Lat. 35. 15. It is famous for the last and decisive battle fought in its neighbourhood between Alexander the Great and Darius Codomannus. This battle was fought 331 years before Christ, and the event of it determined the fate of the Persian empire. Arrian relates, that Darius's army confifted of a million of foot and 40,000 horse; according to Diodorus, there were 200,000 horse and 800,000 foot; Plutarch relates, that the horse and foot together made up a million; and Justin gives us exactly half Diodorus's number. The Macedonian army, according to Arrian, confisted of 40,000 foot and 7000 horse.

Upon receiving notice of the vast strength of the e-

Gillies's

Hift. of

Greate.

nemy, Alexander expressed neither surprise nor apprehension; but having "commanded a halt, he encamped four days, to give his men rest and refreshment. His camp being fortified by a good intrenchment, he left in it the fick and infirm, together with all the baggage; and, on the evening of the fourth day, prepared to march against the enemy with the effective part of his army, which was faid to confift of 40,000 infantry and 7000 horse, unencumbered with any thing but their provisions and armour. The march was undertaken at the fecond watch of the night, that the Macedonians, by joining battle in the morning, might enjoy the important advantage of having an entire day before them, to reap the full fruits of their expected victory. About half way between the hoftile camps, fome eminences intercepted the view of either army. Having ascended the riling ground, Alexander first beheld the barbarians, drawn up in battle array, and perhaps more skilfully marshalled than he had reason to apprehend. Their appearance, at least, immediately determined him to change his first resolution. He again commanded a halt, summoned a council of war; and different meafures being proposed, acceded to the single opinion of Parmenio, who advifed that the foot should remain stationary until a detachment of horse had explored the field of battle and carefully examined the disposition of the enemy. Alexander, whose conduct was equalled by his courage, and both surpassed by his activity, performed those important duties in person at the head of his light horse and royal cohort. Having returned with unexampled celerity, he again affembled his captains, and encouraged them by a fhort speech. Their

refreshment. " Meanwhile Darius, perceiving the enemy's approach, kept his men prepared for action. Notwithstanding the great length of the plain, he was obliged to contract his front, and form in two lines, each of which was extremely deep. According to the Persian custom, the king occupied the centre of the first line, furrounded by the princes of the blood and the great officers of his court, and defended by his horse and foot guards, amounting to 15,000 chosen men. These splendid troops, who seemed fitter for parade than battle, were flanked on either fide by the Greek mercenaries and other warlike battalions, carefully selected from the whole army. The right wing confilled of the

ardour corresponded with his own; and the foldiers,

confident of victory, were commanded to take rest and

Medes, Parthians, Hyrcanians and Sacæ: the left was Arbela. chiefly occupied by the Bactrians, Persians, and Cardusians. The various nations composing this immense host were differently armed, with swords, spears, clubs, and hatchets: while the horse and foot of each division were promiseuously blended, rather from the refult of accident than by the direction of defign. The armed chariots fronted the first line, whose centre was farther defended by the elephants. Chosen squadrons of Scythian, Bactrian, and Cappadocian cavalry advanced before either wing, prepared to bring on the action, or after it began to attack the enemy in flank The unexpected approach of Alexander and rear. within fight of his tents prevented Darius from fortifying the wide extent of his camp; and, as he dreaded a nocturnal assault from enemies who often veiled their defigns in darkness, he commanded his men to remain all night under arms. This unufual measure, the gloomy filence, the long and anxious expectation, together with the fatigue of a reftless night, discouraged the whole army, but inspired double terror into those who had witnessed the miserable disasters on the banks of the Granicus and the Issus.

44 At daybreak Alexander disposed his troops in a manner suggested by the superior numbers and deep order of the enemy. His main body confifted in two heavy-armed phalanxes, each amounting to above 16,000 men. Of these the greater part formed into one line; behind which he placed the heavy-armed men, reinforced by his targeteers, with orders, that when the out-spreading wings of the enemy prepared to attack the flanks and rear of his first line, the fecond should immediately wheel to receive them. The cavalry and light infantry were so disposed on the wings, that while one part relisted the shock of the Persians in front, another, by only facing to the right or left, might take them in flank. Skilful archers and darters were posted at proper intervals, as affording the best defence against the armed chariots, which (as Alexander well knew) must immediately become useless whenever their conductors or horses were wounded.

" Having thus arranged the several parts, Alexander with equal judgment led the whole in an oblique direction towards the enemy's left; a manœuvre which. enabled the Macedonians to avoid contending at once with fuperior numbers. When his advanced battalions, notwithstanding their nearness to the enemy, still stretched towards the right, Darius also extended his left, till, fearing that by continuing this movement, his men should be drawn gradually off the plain, he commanded the Scythian squadrons to advance, and prevent the farther extension of the hostile line. Alexander immediately detached a body of horse to oppose them. An equestrian combat ensued, in which both parties were reinforced, and the barbarians finally repelled. The armed chariots then issued forth with impetuous violence; but their appearance only was formidable; for the precautions taken by Alexander rendered their affault harmless. Darius next moved his main body, but with so little order, that the horse, mixed with the infantry, advanced, and left a vacuity in the line, which his generals wanted time or vigilance to supply. Alexander seized the decisive moment, and penetrated into the void with a wedge of squadrons. He was followed by the nearest sections of the phalanx, who

Arbela rushed forward with loud shouts, as if they had already purfued the enemy. In this part of the field, the vic-Arbitrary, tory was not long doubtful; after a feeble refistance, the barbarians gave way; and the pulllanimous Darius

was foremost in the flight.

"The battle, however, was not yet decided. The more remote divisions of the phalanx, upon receiving intelligence that the left wing, commanded by Parmenio, was in danger, had not immediately followed Alexander. A vacant space was thus left in the Macedonian line, through which fome fquadrons of Perfian and Indian horfe penetrated with celerity, and advanced to the hostile camp. It was then that Alexander derived fignal and well earned advantages from his judicious order of battle. The heavy-armed troops and targeteers, which he had skilfully posted behind the phalanx, speedily faced about, advanced with a rapid flep, and attacked the barbarian cavalry, already entangled among the baggage. The enemy, thus furprised, were destroyed or put to flight. Meanwhile, the danger of his left wing recalled Alexander from the pursuit of Darius. In advancing against the enemy's right, he was met by the Parthian, Indian, and Persian horse, who maintained a sharp conslict. Sixty of the Companions fell; Hephæstion, Conus, and Menides, were wounded. Having at length diffipated this cloud of cavalry, Alexander prepared to attack the foot in that wing. But the business was already effected, chiefly by the Thessalian horse; and nothing remained to be done, but to pursue the fugitives, and to render the victory as decilive as possible.

"According to the least extravagant accounts, with the lose of 500 men he destroyed 40,000 of the barbarians, who never thenceforth assembled in sufficient numbers to dispute his dominion in the east. The invaluable provinces of Babylonia, Sufiana, and Perfis, with their respective capitals of Babylon, Susa, and Persepolis, formed the prize of his skill and valour. The gold and filver found in those cities amounted to thirty millions sterling; the jewels and other precious spoil, belonging to Darius, sufficed, according to Plutarch, to load 20,000 mules, and 5000 camels." The confequences of this victory the reader will find nar-

rated under the article Persia.

ARBERG, a town of Swifferland, in the canton of Bern, with a handsome castle, where the bailisf resides. It is seated on the river Aar, in a kind of island. E. Long. 17. 15. N. Lat. 47. 0.

ARBITER, in the civil law, implies a judge nominated by the magistrate, or chosen voluntarily by the two contending parties, in order to decide their

differences.

The civilians make a difference between arbiter and arbitrator, though both found their power on the compromife of the parties; the former being obliged to judge according to the customs of the law, whereas the latter is at liberty to use his own discretion, and accommodate the difference in the manner that appears to him most just and equitable.

ARBITRARY, that which is left to the choice or arbitration of men, or not fixed by any positive law or

ARBITRARY Punishment, in law, denotes, fuch punishments are by statute left to the discretion of the judge. It is a general rule in arbitrary punishments, that the judge cannot inflict death. Hence all punishments that are not capital have acquired the name of arbitrary punishments, even although they be expressly pointed out by statute.

ARBITRATION is where the parties, injuring and injured, submit all matters in dispute, concerning any personal chattels or personal wrong, to the judgment of two or more arbiters or arbitrators; who are to decide the controverfy: and if they do not agree, it is usual to add, that another person be called in as umpire, imperator or impar), to whose sole judgment it is then referred; or frequently there is only one arbitrator originally appointed. This decision, in any of these cafes, is called an award. And thereby the question is as fully determined, and the right transferred or fettled, as it could have been by the agreement of the parties or the judgment of a court of justice. See also LAW, Part III. No clxxxv. 15, &c.

ARBITRATOR, a private extraordinary judge, chosen by the mutual consent of parties, to determine controversies between them. See ARBITER and ARBI-

ARBOIS, a small populous town of France, in the Franche Compte, famous for its wines. E. Long. 5.40.

N. Lat. 46. 55.

ARBON, an ancient town in Swifferland, on the fouth banks of the lake Constance, in Thurgaw. It has a castle built by the Romans, and is under the jurisdiction of the bishop of Constance. In the time of war, the Swife have a right to put in a garrifon. The Popish and Protestant religions are equally tolerated in this town. E. Long. 9. 30. N. Lat. 4. 38.

ARBOR, in botany, a tree. Trees are by Linnæus classed in the seventh family of the vegetable kingdom, and are distinguished from shrubs in that their stems come up with buds on them; but this diffinction holds not univerfally, there being rarely any buds on the

large trees in India.

ARBOR, in mechanics, the principal part of a machine, which ferves to fullain the refl; also the axis or fpindle on which a machine turns, as the arbor of a crane, windmill, &c.

ARBOR Diana. See CHEMISTRY, Index. ARBOR Vita. See Thuya.

ARBORESCENT, an epithet applied to fuch objects as resemble trees.

ARBORESCENT Star-fish, in zoology, a species of a. fterias. See ASTERIAS.

ARBORIBONSES, in modern history, priests of Japan, who live an erratic life, and subfit on alms. They dwell in caverns, and cover their heads with bonnets made of the bark of trees.

'ARBORIST, a person skilled in that part of botany which treats of trees.

ARBOUR, in gardening, a kind of shady bower, formerly in great efteem; but of late rejected on account of its being damp and unwholesome.

Arbours are generally made of lattice work, either of wood or iron; and covered with elms, limes, hornbeams; or with creepers, as honeyfuckles, jalmines, or passion flowers; either of which will answer the purpole very well, if rightly managed.

ARBROATH. See ABERBROTHICK.

ARBURG, a town of Swifferland, in the canton of Bern, on the river Aar. It is small, but very strong, C c 2

Arbitta Arburg findcula being scated on a rock, and defended by a good fortress cut out of the rock. E. Long. 17. 55. N. Lat. 47. 10.

ARBUSCULA is used by Bradley to denote a little or dwarf tree, above the rank of shrubs, but below that of trees; fuch, e. g. as the elder.

ARBUSTUM implies a number or multitude of

trees planted for the fruit's fake.

The word was more peculiarly applied to a place planted with trees for fattening vines to, which are hence called by Columella arbuflive.

ARBUSTUM is fometimes also used to denote an orchard, or field wherein trees are planted at fuch distance that there is room for ploughing and growing

corn between.

ARBUTHNOT (Alexander), principal of the univerfity of Aberdeen in the reign of James VI. of Scotland, was born in the year 1538. He studied first at Aberdeen; and was afterwards fent over to France, where, under the famous Cujacius, he applied himfelf to the study of the civil law. In the year 1563, he returned to Scotland, and took orders. Whether he was ordained by a bifliop or by prefbyters, is a matter of uncertainty. In 1568, he was appointed minister of Arbuthnot and Logie Buchan; and in the following year, Mr Alexander Anderson being deprived, our author was made principal of the king's college at Aberdeen in his room. In the general affembly which met at Edinburgh in the years 1573 and 1577, he was chosen moderator; and to the end of his life was an active supporter of the reformed religion. He died in 1583, in the 45th year of his age; and was buried in the College church of Aberdeen. We are told in the Biographia, that he was eminent as a poet, a philosopher, a mathematician, a lawyer, a divine, and a phyfician. He wrote Orationes de origine et dignitate juris, printed at Edinburgh, 1572, 4to. His cotemporary Thomas Maitland wrote a copy of Latin verses on the publication of this book: they are printed in the Delic. Poetar. Scot. He published Buchanan's History of Scotland in the year 1582.

ARBUTHNOT (Dr John), was born in Kincardineflire, near Montrole, and was educated at Aberdeen, where he received his degree in physic. The difficulties in which his family was involved, on account of their political principles, making it necessary that he should court preferment in another country than his own, he went to London. The first character in which he acted there was a teacher of the mathematics; and while he was employed in this manner, he had occasion to publish his Examination of Dr Woodward's Account of the Dilige. This tract, which abounded with learning and good fenfe, ferved to make him known. He published foon after his Leffay on the ujefulness of Mathematics. In the profession of physic he advanced by flow but fure degrees; and his reputation in it was at length fully established, by a successful cure which he performed on Prince George of Denmark. Queen Anne, in consequence of it, appointed him one of her physicians in ordinar in 1700; and, fone years before this, his extensive knowledge had procured his admirlion into the Royal Society. His talents and worth were the flioraged recommendations of him to the men of wit and learning of his day; and he entered into particular cornexion with Pope and Swift, with whem he joined in publishing several volumes of miscellanies;

among which are the well known Memoirs of Martinus Arbutus. Scriblerus, a fatire of infinite humour on the abuses' of human learning. In 1715, he affilted Pope and Gay in the Three hours after marriage; a dramatic performance, which was brought upon the stage without fuccels. In 1727, he published Tables of ancient coins, weights, and measures; a work of great use. and real crudition. In 1732, his valuable tract concerning The nature and choice of aliments appeared; which, the year after, was followed by his remarks on The effects of air on human bodies. A constitutional afthma had diffressed him at different periods of his life, and proved fatal to him in 1734 .- Dr Arbuthnot appears to have been in all respects a most accomplished and amiable person. He has showed himself equal to any of his cotemporaries in wit and learning, and he was superior to most men in the moral duties of life, in acts of humanity and benevolence. His letter to Mr Pope, written as it were upon his deathbed, and which no one can read without the tenderest emotion, discovers such a noble fortitude of mind at the approach of his diffolution, as could be inspired only by a clear conscience, and the calm retrospect of an uninterrupted course of virtue. In 1751, came out, in two vols. 8vo, printed at Glafgow, The miscellaneous works of the late Dr Arbuthnot; which are faid to comprehend, with what is inferted in Swift's Mifcellanies, all the pieces of wit and humour of this admirable author.

ARBUTUS, the STRAWBERRY TREE: A genus of the monogynia order, belonging to the decandria class of plants; and in the natural method ranking under the 18th order, Bicornes. The calyx is divided into five parts; the corolla is ovated; and the fruit is a berry with five cells.

Species. 1. The unedo, or common strawberry tree. is a native of Italy, Spain, and also of Ireland; and is now very common in the British gardens. Of this species there are four varieties, viz. The oblong fruited, the round fruited, the red flowered, and the double blofformed. One description is nearly common to them all; and their inconfiderable variation is almost fusficiently shown in their respective appellations.

The oblong fruited fort will grow to be a middlingfized tree in some countries; for we read of the large uses its wood has been applied to; such as Arbutea erates, &c. Arbutean harrows, &c. With us it may be kept down to any fize. The main flems are covered with a light brown bark, rough, and falling. The younger branches are of a kind of purple colour, whilst the last year's shoots are of a fine red, and a little hairy. The leaves grow alternately on the branches, and are of an oblong oval figure. They stand on short footflalks, and the oldest leaves make a contrast with the younger by having their footflalk and mid rib of a fine fearlet colour. They are smooth, and beautifully ferrated. Their upper furface (as in rioft trees) is of a stronger green than their under; and the young twigs are garnished with them in plenty. These are beauties common to most trees, in some degree or other; but every thing elfe almost of this tree that prefents itself to consideration is singular: The time of its flowering will be in November and December; when it is rather fingular to fee a tree in the open ground in full blow; and the fruit ripens by that time twelvemonth after. The manner and nature of the

fruit, which look like very large red strawberries, give it also a fingular and delightful look; and this is heightened as they appear all over the tree among the flowers; for that is the time of its being ripe, when the flowers for the succeeding crop are fully out. The flowers themselves make no great sigure; they are of a kind of whitish yellow colour; and are succeeded by the above-mentioned ftrawberry fruit, which will require a revolution of twelve months before they perfectly arrive at their maturity and colour. The flowers of the first fort are larger than those of the second; and the fruit is oval, and much larger than our common scarlet strawberry.

The round fruited fort has pitcher-shaped flowers, which are succeeded by round scarlet fruit, as wide as they are long; and this is all the difference between these forts.

The red flowered fort differs in no respect from the common fort, only the flowers are red, and these conflitute a variety from the other forts of flowers; but the contrast is not so great between their fruit and them as of the other forts, their colour approaching too near to a famenels.

The double bloffomed fort differs in no respect, only that the flowers are double; but this difference is fo inconsiderable, that it will not be seen without looking into the flower; and even then the doubleness will appear so trifling as scarcely to merit notice; so that a plant or two, to have it faid that the collection is not without it, will be fufficient. Neither ought any more to be admitted; for they will not produce the fame plenty of fruit, which constitutes the greatest beauty of these trees, as the single forts.

The above forts thrive best in a wet soil, and are seldom hurt by hard winters, though the young and tender branches are often destroyed by frost; but, however dead the trees may appear, they ought always to be suffered to remain till the following summer shows

what are living and what are dead.

The method of propagating the varieties of the unedo is by layers and cuttings: the species itself may be raifed from feed .- 1. Propagation by layers. The operation mult be performed on the youngest twigs; and in some soils they will strike root pretty freely, whilst in others they can hardly be made to grow at all: but before they have lain two fummers, you may scarcely venture to look for any. When the roots are struck, the layers should be carefully taken off in the spring, and planted in separate pots: and after well watering them, they should be plunged up to the rims in a hotbed, and this will fet them forward; for without this affistance many of the layers will be lost; fince they are difficult plants to make grow. After the hotbed has forced the feeds into a state of vegetation, the pots may be taken out, and plunged up to the rims in some natural mould, to keep them cool and moift; and here they may fland for two or three years, or longer, if the pots are large enough, without ever removing or sheltering in winter; for they are hardy enough to reful our severest cold. When they are to be finally fet out, all the mould may be turned out of the pots hanging to the roots; and having proper holes made ready, they may be planted in them, and the plant will be ignorant of its new fituation.

2. By cuttings. These must be planted in pots, and Arbu have the benefit of a good bark bed; in which being constantly shaded and duly watered, many of them will grow. As the plants raised this way will be rather tender by being forced in the bark bed, it will be necessary to remove them into the greenhouse, or to place them under a hotbed frame during the first winter: and after that, the pots may be fet up to the rims in the ground, and, like the layers, the plants may be turned out at a convenient time into the places where they are to remain.

3. Raifing from feeds. Let these be taken from the oblong or round fruited fort. The feeds, which will be ripe some time in November or the beginning of December, for they will not be ripe at the same time in all places, must be then gathered; and as they should not be fown until the spring, it will be proper to put them into a pot or jar, mixing with them a quantity of drift fand; and this will preserve them found and good: The beginning of March is the bell time for fowing the feeds; and the best foil for them is maiden earth, taken from a rich pasture at least a year before, with the fward; and this, by conflant turning, being well rotted and mixed, will be ready to receive them. Having filled a different quantity of pots with this fine mould, let the feeds be fown, and but just covered. scarcely a quarter of an inch deep. A dry day should be chosen for the business; and no watering by the hand should be given them, as it will endanger the fetting the mould hard in the pots. Leave them abroad until some rain falls, which at that time may be hourly expected; and after that, having a hotbed ready, plunge the pots therein. In less than fix weeks you may expect your plants to appear; when much air should be assorted them, and frequent waterings, in fmall quantities, gently sprinkled over them. After this, they may be hardened to the air by degrees, and the pots fet up to the rims in the natural mould, in a shady place. In October they should be removed into the greenhouse, or some shelter, in frosty weather; though they should always be fet abroad in mild open weather. In the fpring they may be shook out, and planted in separate pots; and they should have the advantage also of a hotbed to set them a growing: their future management may be the same as was directed for the layers. When these trees are to be planted out, very little regard need be paid to the foil or fituation; for they will grow almost anywhere, and refist our feverest northern blasts. One thing, however, the gardener must constantly observe, in order to continue his trees in their beauty, viz. As often as a heavy fnow falls, fo constantly should he go and shake the boughs; for it will lodge among the leaves and branches in such great quantity as to weigh down and split the largest branches; the deformity of which afterwards may be casily conceived. Besides, many years must expire before the tree will, if ever it should, grow to its former beauty; to preferve this, therefore, makes the narrowly watching these trees in snowy weather highly necessary.

2. The andrachne will grow to a larger fize than the arbutus. The leaves are smooth, and nearly of the same figure as the preceding fort; though they are larger, and have their edges undivided. The flowers grow like the other forts; are of the fame colour; and

breade they are succeeded by large, oval, scarlet fruit. It is called the Oriental Strawberry Tree, because this fort grows plentifully in many parts of the East, and is useful to the inhabitants for many purpoles in life.

The andrachne may be propagated in the faine manner as the arbutus: But the plants must be preserved in pots for three or four years till they have obtained strength; and may be then planted in a warm fituation and on a dry foil, for this species will not thrive on wet ground.

Besides the above, there are three other species of arbutus, viz. The acadienfis, a native of Arcadia; the alpina, or mountain strawberry tree, a native of Britain; and the uva urfi, a plant lately discovered in the Highlands of Scotland, and which formerly wasthought not to be a native of Britain.

ARCADE, in architecture, is used to denote any opening in the wall of a building formed by an arch. ARCADI, or ARCADIANS, the name of a learned fociety at Rome. See the Article ACADEMY.

ARCADIA, an inland district in the heart of Peloponnesus (Strabo). It is mountainous, and fitter for patture than corn; and therefore chiefly celebrated by bucolic or pattoral poets, who feigh Pan, the god of shepherds, to be the guardian of it (Virgil). It has to the north Achaia, to the east Aigos and Laconia, Messenia to the fouth, and Elis to the west. According to Pliny, the wine of this country cured barrenness in women, and inspired the men with rage; and the berries of the yew gathered there were fo flrong a poifon, that whoever flept or took refreshment under that tree were fure to die. In Strabo's time there were few cities remaining in it, most of them being destroyed in the Grecian wars. Euftathius fays, that the country was anciently called Pelafgia, from Pelafgos, who brought the people, from roots, herbs, and leaves of trees, to feed on acorns, especially beech mast; as Artemidorus observes, that the Arcadians usually lived on acorns. It was also called Lycuonia, Gigantis, and Purrhasia (Stephanus). The Arcadians are greatly commended for their love of, and skill in, music (Virgil, Polybius). To imitate the Arcadians, is to labour and toil for the benefit of others, never conquering their own, but the enemies of others (Helychius). This probably took its rife from the ancient Arcadians being accultomed to hire themselves out as mercenaries to foreign nations. Homer commends their martial prowefs, their pastures, their sheep, and their country well watered. The gentilitious name is Arcades; who boafted of their great antiquity, and that they were older than the fun and moon (Apollonius Rhodius, Nonnius, Plutarch, Ovid, Statius). They were the first who had a year of three months, and therefore called Proceleni, because their year was prior to that adjusted in Greece to the course of the moon (Censorinus).

ARCANGIS, in the Turkish armies, an inferior kind of infantry, which ferve as enfans perdus, and to harass and pillage the enemy's frontiers. The Arcangis are an order inferior to the Janizaries; and when any of them diftinguish themselves, are usually preferred into the Janizaries order. They have no pay, but ere to subfist on their plunder.

ARCANUM, among physicians, any remedy, the preparation of which is industriously concealed, in order to enhance its value.

ARCANUM (anc. geog.), a villa of Q. Cicero, Tul. Archoutant ly's brother, in Latium, (Cicero). Now Arce, in the Terra di Lavora, in the kingdom of Naples, on the borders of the Campagna di Roma, on the river Melpis, between Arpinum and Aquinum.

ARCBOUTANT, in building, an arched buttrefs.

See BUTTRESS.

ARCESILAUS, a celebrated Greek philosopher. about 300 years before the Christian era, was born at Pitane, in Eolis. He founded the fecond academy, which is called the fecond febool. He was a man of great erudition, and well verled in the writings of the ancients. He was remarkable for the severity of his criticisms; but nevertheless he knew how to accommodate himfelf to the age, and purfue the allurements of pleafure. He had a great number of disciples. His doctrines were different in several respects from those of the ancient school: and perhaps he was led into this diversity of opinions by many capital errors in the ancient school, fuch as the incredible arrogance of the dogmatifts, who pretended to assign causes for all things: the mysicrious air they had thrown upon the doctrine of ideas; the entirely discarding the testimony of the senses; the objections of the Pyrrhonists, who now began to broach their opinions; the powerful opposition of the Stoics and Peripatetics, who discovered the feeble parts of the Academic philosophy. These might have given cause to reform the ancient school, and to found a new one. The middle school, therefore, laid it down us a principle, that we could know nothing, nor even affure ourselves of the certainty of this position; from whence they inferred, that we should affirm nothing, but always suspend our judgment. They advanced, that a philosopher was able to dispute upon every subject, and bring conviction with him, even upon contrary fides of the same question; for there are always reasons of equal force both in the affirmative and negative of every argument. According to this doctrine, neither our fenses, nor even our reason, are to have any credit : and therefore, in common affairs, we are to conform ourselves to received opinions. Arcesilaus was succeeded by his disciple Lacydes.

ARCH, in geometry, any part of the circumference of a circle or curved line, lying from one point to another, by which the quantity of the whole circle or line, or some other thing sought after, may be gathered.

Arch, a concave or hollowed piece of building, constructed in such a manner that the several stones of which it is composed keep one another in their places. The terms arch and vault properly differ only in this, that the arch expresses a narrower, and the vault a broader, piece of the same kind. The principal difference in the form of arches is, that some are circular, and others elliptical; the former having a larger or fmaller part of a circle, the other of an ellipsis. What are called firait arches, are those frequently used over doors and windows, the upper and under edges of which are strait and parallel, and the ends and joints all pointing toward a centre. The space between two piers of a bridge is called an arch, because usually arched

Triumphal ALCHRS are magnificent entries into cities, erected to adorn a triumph, and perpetuate the memory of the action. The arches of Titus and ConArch || |changel.

stantine make at this time a great figure among the ruins of old Rome.

ARCH, in composition, fignifies chief, or of the first class; as archangel, archbishop, &c.

ARCHÆUS, or Archeus. See Archeus.

ARCHANGEL, an angel occupying the eighth rank in the celeftial hierarchy. See Angel and Hierarchy.

ARCHANGEL, a city of Russia, in the province of Dwina, fituated on the east side of the river Dwina, about fix miles from the White fea, in E. Long. 40. 21. N. Lat. 64. 30. The city extends about three miles in length and one in breadth. It is rich, populous, built in the modern taste, and is a metropolitan fee. It role from a castle built on the spot by Basilowitz II. to protect the increasing trade brought there by the discovery of the White sea by the English, and took its name from a monastery built in honour of the archangel Michael. Before this period the commercial intercourse between Russia and the northern parts of Europe had been long carried on by the Hanfeatic towns; which usually sailed to Revel or Narva, and from thence pailed through Dorpt to Plescof and Novogorod, where their factories were established. The accidental discovery of Archangel, in 1553, deprived the Hanseatic towns of a great part of this lucrative commerce, and transferred it to the English. On the 1 1th of May, in the above-mentioned year, three ships failed from Deptford, in order to explore the northern feas, under the command of Sir Hugh Willoughby. Two of these veffels penetrated as high as the 72d degree of latitude, to the coast of Spitzbergen; and being afterwards forced by stress of weather into the hay of the river Arzina in Russian Lapland, both their crews were frozen to death. Richard Chancellor, who commanded the other ship, called the Bonaventure, discovering the country bordering upon the White sea, landed near the mouth of the Dwina, in a bay, which he denominated the Bay of St Nicholas, from a convent of that name near the present port of Archangel. The czar Iwan Basilowitz, being informed of his arrival, invited him to his court, where he was hospitably entertained, and the czar indulged the English with a free trade in his dominions: in consequence of this permission, a company of merchants was incorporated in London; and being encouraged by particular privileges from the czar, fet on foot a confiderable commerce, to the mutual advantage of both nations. This traffic the English for some time enjoyed without competition. The Dutch, however, and other nations, gradually infinuated themselves into this commerce; which they carried on to a very great disadvantage, as not being favoured with those privileges which the czar had granted to the English company. These were at last suddenly annihilated by Alexis Michaelovitch; who in 1648 banished the English merchants from all his dominions. The cause of this expulsion is generally imputed to the refentment which the czar conceived against the English for the execution of Charles I. with whom he was closely connected by leagues of amity and alliance: but in effect he abolished the company's privileges in the year before that event; and his indignation against the English for their rebellion, Mr Coxe affirms, was only a political pretext; the real motive being derived from the offers made by the Dutch to

pay duties of export and import to the amount of 13 Archange per cent. if they were indulged with the liberty of car. Archbilled rying on as free a trade as the English throughout his dominions. For not long afterwards, the czar suffered William Prideaux, Cromwell's agent, to reside at Archangel; and permitted the English to renew their commerce in that port upon the same footing with other foreigners. And upon this footing alone our merchants ever after continued to trade.

The commodities chiefly imported into Archangel, were gold and filver stuffs and laces, gold wire, cochineal, indigo, and other drugs for dyeing; wine, brandy, and other distilled spirits. The customs arising to the czar were computed at 200,000 rubles a-year, and the number of foreign ships at 400 annually. But upon the building of Petersburg, Peter the Great abolished the immunities of Archangel, and removed the commerce of the White sea to the havens of the Baltic. Still, however, its exports of tar were considerable; in 1730, to the amount of 40,000 lasts, of 11 barrels each. It sends, during winter, great quantities of the rawaga, a small species of three-sinned cod, to Petersburg frozen.

In 1752 Elizabeth again restored the ancient immunities of Archangel; and its present trade is not inconsiderable. It supplies the government of Archangel, part of those of Nishnei-Novogorod and Casan, with European commodities; and draws in exchange from those parts corn, slax, hemp, coarse linen, cordage, sails, masts, and tallow, which are mostly conveyed by the Dwina: it forms also a principal communication with the northern and western parts of Siberia, from whence the merchants procure furs, skins, and iron.

The houses of Archangel are generally of wood, but well contrived; and every chamber is provided with a stove, as a sence against the cold, which is here excessive in the winter. The streets are paved with broken pieces of timber and rubbish, disposed so unskilfully, that one cannot walk over it without running the risk of falling, except when the streets are rendered smooth and equal by the snow that falls and freezes in the winter. Notwithstanding the severity of the cold in this place, there is always plenty of good provisions; butcher's meat, poultry, wild sowl, and sish, in great variety, are fold surprisingly cheap.

The most remarkable edifice in Archangel is a large townhouse, built of square stones in the Italian manner, and divided into three parts. One of these consists of large commodious apartments, for the accommodation of merchants, strangers as well as natives: here they are permitted to reside with their merchandise till the month of October, when all the foreign ships set sail for the respective countries to which they belong. Then the traders are obliged to remove their quarters from the townhouse, or palace, which hath a spacious court, that reaches down to the river.

ARCHBISHOP, the name of a church dignitary of the first class. Archbishops were not known in the east till about the year 320; and though there were some foon after this who had the title, yet that was only a personal honour, by which the bishops of considerable cities were distinguished. It was not till of late that archbishops became metropolitans, and had suffragans under them. Athanasius appears to be the first who used the title Archbishop, which he gave occasionally

Bishop casionally to his predecessor; Gregory Nazianzen, in like manner, gave it to Athanasius; not that either of them were entitled to any jurifdiction, nor even any precedence in virtue of it. Among the Latins, Isidore Hispalensis is the first that speaks of archbishops. He diffinguishes four orders or degrees in the ecclesiastical hierarchy, viz. patriarchs, archbishops, metropolitans,

and bishops.

The archbishop, beside the inspection of the bishops and inferior clergy in the province over which he pretides, exercifes episcopal jurifdiction in his own dioccfc. He is guardian of the spiritualities of any vacant fee in his province, as the king is of the temporalities; and exercises ecclesiastical jurisdiction in it. He is entitled to present by lapse to all the ecclesiastical livings in the disposal of his diocesan bishop, if not filled within fix months. He has likewife a customary prerogative, upon confecrating a bishop, to name a clerk or chaplain to be provided for by fuch bishop; in lieu of which it is now usual to accept an option. He is faid to be enthroned when vested in the archbishopric; whereas bishops are said to be installed.

The ecclefiaftical government of England is divided into two provinces, viz. Canterbury and York. Canterbury hath the following fuffragan bishoprics appertaining to it, St Afaph, Bangor, Bath and Wells, Bristol, Chichester, Litchfield, and Coventry, St David's, Ely, Exeter, Gloucester, Hereford, Landaff, Lincoln, London, Norwich, Oxford, Peterborough, Rochester, Salifbury, Winchester, and Worcester. To York appertaineth the hishoprics of Carlifle, Chefter, and Durham; to which may be added the hishoptic of Sodor and Man, whose bishop is not a lord of parliament.

See CANTERBURY and YORK.

The archbishop of Canterbury had anciently, viz. till the year 1152, jurisdiction over Ircland as well as England, and was flyled a patriarch, and fometimes alterius orbis papa, and orbis Britannics pontifex. Matters were done and recorded in his name thus, Anno pontificatus noslri primo, &c. The first archbishop of Canterbury was Auslin, appointed by King Ethelbert, on his conversion to Christianity, about the year 598. He was also regutus natus. He even enjoyed some special marks of toyalty; as, to be patron of a bishopric, which he was of Rochester; and to make knights, coin moneys, &c. He is full the first peer of England, and the next to the royal family; having precedence of all dukes and all great officers of the crown. It is his privilege, by cultom, to crown the kings and queens of this kingdom. He may retain and qualify eight chaplains; whereas a duke is allowed by statute only fix. He has, by common law, the power of probate of wills and tellaments, and granting letters of administration. He has also a power to grant licenses and dispensations in all cases formerly sued for in the court of Rome, and not repugnant to the law of God. He accordingly iffues special licenses to marry, to hold two livings, &c. and he exercises the right of conferring degrees. He also holds several courts of judicature: as, court of arches, court of audience, prerogative court, and court of peculiars.

The archbishop of York has the like rights in his province as the archbishop of Canterbury. He has precedence of all dukes not of the royal blood; and of all officers of state, except the lord high chancellor.

He has also the rights of a count palatine over Hex- Archieanshire. The first archbishop of York was Paulinus, appointed by Pope Gregory about the year 622. He had formerly jurisdiction over all the bishops of Scot-Archelans. land; but in the year 1470, Pope Sextus IV. created the bishop of St Andrew's archbishop and metropolitan of all Scotland.

Scotland, whilst episcopacy prevailed in that country, had two archbifbops, of St Andrew's and Glasgow; of which the former was accounted the metropolitan; and, even before it arrived at the dignity of an archb.shopric, refilled with great spirit all the attempts of the archbishops of York in England to become the metropolitans of Scotland. The fees of Argyll, Galloway, and the isles, were suffragans to Glasgow; all the others in the kingdom to St Andrew's.

Ireland has four archbishops; of Armagh, Dublin, Cashel, and Tuam; of whom the former is primate of

all Ireland.

ARCHBISHOPRIC, in ecclefialtical geography. a province subject to the jurisdiction of an archbishop.

ARCHBUTLER, one of the great officers of the German empire, who presents the cup to the emperor on folemn occasions. This office belongs to the king of Bohemia.

ARCHCHAMBERLAIN, anofficer of the empire, much the same with the great chamberlain in England. The elector of Brandenburg was appointed by the gol-

den bull archchamberlain of the empire.

ARCHCHANCELLOR, an high officer who, in ancient times, prefided over the fecretaries of the court. Under the two first races of the kings of France, when their territories were divided into Germany, Italy, and Arles, there were three archehancellors: and hence the three archchancellors still subsisting in Germany; the archbishop of Mentz being archehancellor of Germany, the archbishop of Cologn, and the archbishop of Treves.

ARCHCHANTOR, the prefident of the chantors

of a church.

ARCHCOUNT, a title formerly given to the earl of Flanders, on account of his great power and riches.

ARCHDEACON, an ecclefiastical dignitary or officer next to a bishop, whose jurisdiction extends either over the whole diocese or only a part of it. He is usually appointed by the bishop himself; and hath a kind of episcopal authority, originally derived from the bishop, but now independent and distinct from his. He therefore visits the clergy; and has his separate court for punishment of offenders by spiritual censures, and for hearing all other causes of ecclesiastical cognizance. There are 60 archdeacons in England.

ARCHDEACON's Court, is the most inferior court in the whole ecclefiaftical polity. It is held in the archdeacon's absence, before a judge appointed by himself and called his official; and its jurisdiction is sometimes in concurrence with, fometimes in exclusion of, the bishop's court of the diocese. From hence, however, by statute 24 Hen. VIII. c. 12. there lies an appeal to

that of the bishop.

ARCHDRUID, the chief or pontiff of the ancient druids of a nation. See Dauid.

ARCHDUKE, a title peculiar to the house of Auftin; all the fons of which are archdukes, and the daughters archduchesses. See DUKE.

ARCHELAUS, a celebrated Greek philosopher,

Archebra the disciple of Ananagoras, flourished about 440 years before Christ. He read lectures at Athens, and did Archery. not depart much from the opinions of his mafter. He taught that there was a double principle of all things, namely, the expansion and condensation of the air, which he regarded as infinite. Heat, according to him, was in continual motion. Cold was ever at reft. The earth, which was placed in the midft of the universe, had no motion. It originally refembled a wet marsh, but was afterwards dried up; and its figure, he faid, refembled that of an egg. Animals were produced from the heat of the earth, and even men were formed in the same manner. All animals have a foul, which was born with them: but the capacities of which vary according to the ftructure of the organs of the body in which it resides .- Socrates, the most illustrious of his disciples, was his fuccesfor.

> ARCHELAUS, the fon of Herod the Great, was declared king of Judea the second year after the birth of Christ. He put to death 3000 persons before he went to Rome to be confirmed by Augustus. However, that emperor gave him half of what had been possessed by his father; but at length, on fresh complaints exhibited against him by the Jews, he banished him to Vienne in Gaul, A. D. 6, where he died.

> Archelaus, the son of Apollonius, one of the greatest sculptors of antiquity, was a native of Ionia, and is thought to have lived in the time of the emperor Claudius. He executed, in marble, the apotheofis of Homer. This masterpiece in sculpture was found in 1568, in a place named Fratocchia, belonging to the princes of Colonna, where, it is said, the emperor Claudius had a pleasure house. Father Kircher, Cupert, Spanheim, and several other learned antiquaries, have given a description and explication of this work.

> ARCHERS, a kind of militia or foldiery armed with bows and arrows. The word is formed of areus, " a bow;" whence arcuarius, and even arquis, and arquites, as they are also denominated in the corrupt

flate of the Latin tongue.

Archers were much employed in former times; but they are now laid alide, excepting in Turkey and some of the eaftern countries; where there are companies of archers still fublishing in their armies, and with which they did terrible execution at the battle of Lepanto .-As an exercise, the practice of archery is still kept up in many places. See the article ARCHERY.

In France, the officers who attend the lieutenants de police and provofts to make captures, ferzures, arrefts, &c. are called archers; though their arms be only halberds or carabines.- In this fense they say, the archers of the grand prevot de l'hotel; of the prevot des marchands; the city archers; the archers du gues, or of the watch, &c. - Small parties or grehers, called also gens de marechausse, are continually patrolling on the great roads, to fecure them against robbers .- The carriages of Lyons, &c. are always efcorted by a party of archers. To the diligence of these archers, or marshal's men, it is partly owing, that persons now travel in all parts of France in the utmost security; there being fewer robberies on the highway in that whole kingdom in a year than about London in a week.

ARCHERY, the art or excercise of shooting with

a bow and arrow. Vol. II. Part I.

In most nations, the bow was anciently the principal Arthery, implement of war; and by the expertness of the archers alone was often decided the fate of battles and of empires .- In this island archery was greatly encouraged in former times, and many flatutes were made for the regulation thereof; whence it was that the English archers in particular became the best in Europe, and procured them many fignal victories.

The Artillary Company of London, though they have long disused the weapon, are the remains of the ancient fraternity of bowmen or archers. Artillery Archaelegia (artillérie) is a French term fignifying archery; as the Vol. VII. hing's bowyer is in that language flyled artillier du roy: And from that notion the English seem to have learnt at least the cross-bow archery. We therefore find that William the Conqueror had a confiderable number of bowmen in his army at the battle of Haftings, when no mention is made of fuch troops on the fide of Harold. And it is supposed that these Norman archers shot with the arbalest (or cross bow), in which formerly the arrow was placed in a groove, being termed in

French a quadrel, and in English a bolt.

Of the time when shooting with the long bow first began among the English, at which exercise they afterwards became so expert, there appear no certain accounts. Their chroniclers do not mention the use of arthery as expressly applied to the cross bow, or the long bow, till the death of Richard I. who was killed by an arrow at the fiege of Lunoges in Guienne, which Hemmingford mentions to have iffued from a cross bow .---After this, which happened in 1199, there appear not upon record any notices of archery for nearly 150 years, when an order was issued by Edward III. in the 15th year of his reign, to the therives of most of the English counties for providing 500 white bows and 500 bundles of arrows, for the then intended war against France. Similar orders are repeated in the following years; with this difference only, that the sheriff of Gloucesterfhire is directed to furnih 500 painted bows as well as the same number of white. The famous battle of Cresfy was fought four years afterwards, in which our chroniclers state that we had 2000 archers, who were opposed to about the same number of the French, together with a circumstance which scems to prove, that by this time we used the long bow, whilst the French archers shot with the arbalest. The circumstance alluded to is as follows: Previously to the engagement there fell a very heavy rain, which is faid to have much damaged the bows of the French, or perhaps rather the ftrings of them. Now the long bow (when unftrung) may be most conveniently covered, so as to prevent the rain's injuring it; nor is there scarcely any addition to the weight from a case; whereas the arbalest is of a most inconvenient form to be sheltered from the weather. As therefore, in the year 1342, orders were iffued to the sherives of each county to provide 500 bows, with a proper proportion of arrows, it feems probable that thefe were long bows, and not the arbaleft.

At the above-mentioned battle, the English ascribed their victory chiefly to the archers .- The battle of Poictiers was fought A. D. 1356, and gained by the

Sometimes the archers gained great victories without even the least affishance from the men at arms; as $\mathbf{D} \mathbf{d}$ particularly,

particularly, the decisive victory over the Scots at Homildon, A. D. 1402. In that bloody battle, the menat-arms did not strike a stroke, but were mere speciators of the valour and victory of the archers. The earl of Douglas, who commanded the Scotch army in oliv. that action, enraged to see his men falling thick around him by showers of arrows, and trusting to the goodness of his armour (which had been three years in making), accompanied by about eighty lords, knights, and gentlemen, in complete armour, rushed forward, and attacked the English archers sword in hand. But he foon had reason to repent his rashness. The English arrows were fo sharp and strong, and discharged with so much force, that no armour could repel them. The earl of Douglas, after receiving five wounds, was made prisoner; and all his brave companions were either killed or taken. Philip de Comines acknowledges, what our own writers affert, that the English archers excelled those of every other nation; and Sir John Fortescue says again and again,—that the might of the realme of England standyth upon archers." fuperior dexterity of their archers gave the English a great advantage over their capital enemies the French and Scots. The French depended chiefly on their men-at-arms, and the Scots on their pikemen; but the ranks of both were often thinned and thrown into diforder by flights of arrows before they could reach their enemics.

James I. of Scotland, who had feen and admired the dexterity of the English archers, and who was himself an excellent archer, endeavoured to revive the exercise of archery among his own subjects, by whom it had been too much neglected. With this view, he ridiculed their awkward manner of handling their bows, in his humorous poem, of Christ's Kirk on the Green; and procured the following law to be made in his first parliament, A. D. 1424, immediately after his return to Scotland: "That all men might busk thame to be archares fra the be 12 years of age; and that ilk ten punds worth of land thair be made bow markes, and speciallic near paroche kirks, quhairn upon halie dayis men may cum, and at the leift schute thryse about, and have usage of archarie; and whata usis not archarie, the laird of the land sal rais of him a wedder; and giff the laird raifis not the faid pane, the king's shiref, or his ministers fall rais it to the king." But the untimely death of that excellent prince prevented the effectual execution of this law.

There is not found any act of parliament of Henry V. in relation to archery, and all the orders in Rymer till the battle of Agincourt relate to great guns, from which he feems at first to have expected more considerable advantage than from the training of bowmen. It should seem, however, that this fort of artillery, from its unwieldiness, bad and narrow roads, together with other defects, was as yet but of little use in military operations. In the year 1417 this king therefore ascribes his victory at Agincourt to the archers, and directs the sherives of many counties to pluck from every goofe fix wing-feathers for the purpose of improving arrows, which are to be paid for by the king.

in 1421, though the French had been defeated both at Creffy, Poictiers, and Agincourt, by the English

archers, yet they still continued the use of the cross Archers. bow; for which reason, Henry V. as duke of Normandy, confirms the charters and privileges of the balistarii, who had been long established as a fraternity in his city of Rouen.

In the fifth of Edward IV. an act passed, that every Englishman, and Irishman dwelling with Englishmen, shall have an English bow of his own height, which is directed to be made of yew, wych, hazel, ash, or awburne, or any other reasonable tree according to their power. The next chapter also directs that butts shall be made in every township, which the inhabitants are obliged to shoot up and down every feast day, under the penalty of a halfpenny when they shall omit this exercise.

In the 14th year, however, of this same king, it appears by Rhymer's Fadera, that 1000 archers were to be sent to the duke of Burgundy, whose pay is settled at fixpence a day, which is more than a common foldier receives clear in the present times, when provisions are so much dearer, and the value of money so much decreased. This circumstance seems to prove, very strongly, the great estimation in which archers were still held. In the same year, Edward, preparing for a war with France, directs the sherives to procure bows and arrows, " as most specially requisite and necesfary."

On the war taking place with Scotland, eight years after this, Edward provides both ordnance and archers; so that though the use of artillery (as we now term it) was then gaining ground, yet that of the bow and arrow was not neglected.

Richard III. by his attention to archery, was able to fend 1000 bowmen to the duke of Bretagne, and he availed himself of the same troops at the battle of

During the reign of Henry VII. however, there appears no order relative to gunpowder or artillery; whilst on the other hand, in 1488, he directs a large levy of archers to be fent to Brittany, and that they shall be reviewed before they embark. In the 19th year of his reign, this same king forbids the use of the cross bow, because " the long bow had been much used in this realm, whereby honour and victory had been gotten against outward enemies, the realm greatly defended, and much more the dread of all Christian princes by reason of the same."

During the reign of Henry VIII. several statutes were made for the promotion of archery. The 8th Eliz. c. 10. regulates the price of bows, and the 13th Eliz. c. 14. enacts, that bow staves shall be brought into the realm from the Hanse towns and the Eastward; so that archery still continued to be an object of attention in the legislature.

In Rymer's Fadera there is neither statute or proclamation of James I. on this head; but it appears by Dr Birch's life of his fon (Prince Henry), that at eight years of age, he learned to shoot both with the bow and gun, whilst at the same time this prince had: in his establishment an officer who was styled bowbearer. The king granted a second charter to the Artillery Company, by which the powers they had received from Henry VIII. were confiderably extended.

Charles I. appears, from the dedication of a trea-

Archery. tife entitled The Bowman's Glory, to have been himfelf an archer; and in the eighth year of his reign he issued a commission to the chancellor, lord-mayor, and feveral of the privy council, to prevent the fields near London being so enclosed as " to interrupt the necesfary and profitable exercise of shooting," as also to lower the mounds where they prevented the view from one mark to another.

> Catharine of Portugal (queen to Charles II.) feems to have been much pleafed with the fight at least of this exercise; for in 1676, by the contributions of Sir Edward Hungerford and others, a filver badge for the marshal of the fraternity was made, weighing 25 ounces, and reprefenting an archer drawing the long bow (in the proper manner) to his ear, with the following inscription: Regina Catherina Sagittarii. The supporters are two bowmen, with the arms of England and Portugal. In 1682 there was a most magnificent cavalcade and entertainment given by the Finsbury archers, when they bestowed the titles of "duke of Shoreditch," " marquis of Islington," &c. upon the most deferving. Charles II. was present upon this occasion; but the day being rainy, he was obliged foon to leave the field.

> So lately as the year 1753 targets were erected in the Finsbury fields, during the Easter and Whitsun holidays; when the best shooter was styled Captain for the enfuing year, and the second Lieutenant.

> Why this military weapon was fo decifive in the battles of former days, the following reasons may be

Before the introduction of fire arms the enemy could only be struck at a distance by slings, the bow used by the ancients, or the cross bow; to all which the English long bow was infinitely superior. As for slings, they never have been used in the more northern parts of Europe by armies in the field; nor does their use indeed feem to have been at all convenient or extensively practicable, for two principal reasons: In the first place, flingers cannot advance in a compact body, on account of the space to be occupied by this weapon in its rotatory motion; in the next place, the weight of the flones to be carried must necessarily impede the slingers greatly in their movements. The bow of the ancients again, as represented in all their reliefs, was a mere toy compared with that of our ancestors; it was therefore chiefly used by the Parthians, whose attacks (like those of the present Arabs) were desultory. As for the cross bow, it is of a most inconvenient form for carriage, even with the modern improvements; and, in case of rain, could not be easily secured from the weather. After the first shot, moreover, it could not be recharged under a confiderable time, whilft the bolts were also heavy and cumbersome. The English long bow, on the other hand, together with the quiver of arrows, was eafily carried by the archer, as eafily secured from the rain, and recharged almost instantaneously. It is not therefore extraordinary, that troops, who folely used this most effectual weapon, should generally obtain the victory, even when opposed to much more numerous armies.

It may be preed, that these losses having been experienced by our enemies, must have induced them to practife the same mode of warfare. But it is thought that the long bow was not commonly used Archery. even in England till the time of Edward III. when the victory at Creffy fufficiently proclaimed the superiority of that weapon. It required, however, fo much training before the archer could be expert, that we must not be surprised if soon afterwards this military exercise was much neglected, as appears by the preambles of feveral ancient flatutes. Whilst the military tenures subsisted, the sovereign could only call upon his tenants during war, who therefore attended with the weapons they had been used to, and which required no previous practice. On the other hand, the English archers were obliged by acts of parliament, even in time of peace, to erect butts in every parish, and to shoot on every Sunday and holiday, after repairing perhaps to these butts from a considerable distance, whilst the expence of at least a yew bow is represented as being a charge which they were scarcely equal to. The king and parliaments of this country having thus compelled the inhabitants to fuch training, the English armies had (it should seem) the same advatage over their enemies as the exclusive use of fire arms would give us at prefent.

It appears also by what hath been already stated. that the long bow continued to be in estimation for more than two centuries after gunpowder was introduced, which probably arose from muskets being very cumbersome and unweildy. It is well known that rapid movements are generally decifive of the campaign; and for such the archers were particularly adapted, because, as they could not be annoyed at the same distance by the weapons of the enemy, they had scarcely any occasion for armour. The flower of ancient armies likewise was the cavalry against which the long bow never failed to prevail, as man and horse were too large objects to be missed: and hence the great number of French nobility who were prisoners at Cressy, Poictiers, and Agincourt; for being dismounted (if not wounded) whilft they were also clad in heavy armour, they could not make their escape. The same reason accounts for the English obtaining these signal victories with fo inferior numbers; for the nobility and gentry thus becoming prisoners, the other parts of the French army made little or no resistance. No wonder, therefore, that in England the greatest anxiety was shown to promote the exercise of this most imporant weapon, and that so many statutes were made for that

purpose.

In Scotland, also, little less attention, though apparently not with equal fuccess, was shown to the encouragement of the art. In both kingdoms, it was provided, that the importers of merchandise should be obliged, along with their articles of commerce, to import a certain proportion of bows, bow staves, and fhafts for arrows. In both, every person was enjoined to hold himself provided in bows and arrows, and was prescribed the frequent use of archery. In both, a restraint was imposed upon the exercise of other games and sports, left they should interfere with the use of the bow; for it was intended, that people should be made expert in the use of it as a military weapon, by habituating them to the familiar exercise of it as an instrument of amusement. As there was no material difference beteween the activity and bodily strength of

the two people, it might be supposed that the English and Scots wielded the bow with no unequal vigour and deaterity: but from undoubted historical monuments it appears that the former had the superiority; of which one instance has been already narrated. By the regulations prescribed in their statute book for the practice of archery, we find that the English shot a very long bow, those who were arrived at their full growth and maturity being prohibited from shooting at any mark that was not distant upwards of 220

In the use of the bow, great dexterity as well as strength feems to have been requisite. Though we hear of arrows at Cheviot Chafe which were a vard long, yet it is by no means to be supposed that the whole band made use of such, or could draw them to the head. The regulation of the Irish statute of Edward IV. viz. that the bow shall not exceed the height of the man, is allowed by archers to have been well confidered; and as the arrow should be half the length of the bow, this would give an arrow of a yard in length to those only who were fix feet high. A flrong man of this fize in the prefent times cannot cafily draw above 27 inches, if the bow is of a proper through to do execution at a confiderable diffance. At the same time it must be admitted, that as our anceltors were obliged by some of the old statutes to begin shooting with the long bow at the age of seven, they might have acquired a greater flight in this exererfe than their descendants, though the latter should be allowed to be of equal strength.

As the shooting with the long bow was first introduced in England, and practifed almost exclusively for hearly two centuries, fo it hath occasioned a peculiar method of drawing the arrow to the ear and not to the breatl. That this is contrary to the usage of the ancients is very clear from their reliefs, and from the tradition of the Amazons cutting off one of their paps as it occasioned an impediment to their shooting. The Finsbury archer is therefore represented in this attitude of drawing to the ear, both in the Bowman's Glory, and in the filver badge given by Catharine to the Artillery Company. Not many years ago there was a man named Topham, who exhibited furprifing feats of firength, and who happened to be at a public house near Islington, to which the Finsbury archers resorted after their exercise. Topham considered the long bow as a plaything, only fit for a child; upon which one of the archers laid him a bowl of punch, that he could not draw the arrow two-thirds of its length. Topham accepted this bet with the greatest confidence of winning; but bringing the arrow to his breaft instead of his car, he was greatly mortified by paying the wager, after many fruitless efforts.

As to the distance to which an arrow can be shot from a long bow with the best elevation of forty-five degrees, that must necessarily depend much both upon the strength and slight of the archer; but in general the distance was reckoned from eleven to twelve score yards. The butts for exercise, as above noticed, were directed to be distant upwards of 220 yards. There is indeed a tradition, that an attorney of Wigan in Lancashire (named Leigh) shot a mile in three slights; but the same tradition states, that he placed himself in

a very particular attitude, which cannot be used com- Archerymonly in this exercise. According to Neade, an archer might shoot six arrows in the time of charging and discharging one musket.

The archers consider an arrow of from 20 to 24 drop weight to be the best for slight or hitting a mark at a confiderable diffance, and that yew is the best material of which they can be made. As to the feathers, that of a goofe is preferred; it is also wished, that the bird should be two or three years old, and that the feather may drop of itself. Two out of three feathers in an arrow are commonly white, being plucked from the gander; but the third is generally brown or gray, being taken from the goofe; and, from this difference in point of colour, informs the archer when the arrow is properly placed. From this most distinguished part therefore the whole arrow fometimes receives its name: And this, by-theby, affords an explanation of the gray goofe wing in the ballad of Cheviot Chase. Arrows were armed anciently with flint or metal heads, latterly with heads of iron; of these there were various forms and denominations. By an act of parliament made the 7th of Henry IV. it was enacted, That for the future all the heads for arrows and quarrels should be well boiled or brased, and hardened at the points with steel; and that every arrow head or quarrel should have the mark of the maker; workmen disobeying this order, were to be fined and imprisoned at the king's will, and the arrow heads or quarrels to be forfeited to the crown.

Arrows were reckoned by theaves, a theaf confifting Grafe on of 24 arrows. They were carried in a quiver, called Ancient also an arrow case, which served for the magazine; Armour. arrows for immediate use were worn in the girdle. In ancient times phials of quicklime, or rather combustible matter, for burning houses or ships, were fixed on the heads of arrows, and that from long bows. This has been also practifed fince the use of gunpowder. Neade fays, he has known by experience, that an archer may shoot an ounce of sirework upon an arrow 12 score yards. Arrows with wildfire, and arrows for fireworks, are mentioned among the stores at Newhaven and Berwick, in the 1st of Edward VI.

The force with which an arrow strikes an object at a moderate diflance, may be conceived from the account given by King Edward VI. in his journal; wherein he fays, that 100 archers of his guard flot before him two arrows each, and afterwards all together; and that they shot at an inch board, which some pierced quite through and struck into the other board; divers pierced it quite through with the heads of their arrows, the boards being well-feafoned timber; their distance from the mark is not mentioned.

To protect our archers from the attacks of the enemy'shorfe, they carried long stakes pointed at both ends; thefe they planted in the earth, sloping before them. In the 1st of Edward VI. 350 of these were in the stores of the town of Berwick, under the article of archers stakes; there were also at the same time eight bundles of archers stakes in Pontefract castle.

To prevent the bowftring from firiking the left arm, the arm is covered with a piece of fmooth leather, faitened

Archery, fastened on the outside of the arm; this is called a bracer; and to guard the fingers from being cut by the bowfiring, archers wore shooting gloves. Chaucer in his prologue to the Canterbury Tales, thus describes an archer of his day:

> And he was clade in cote and hode of grene, A sheaf of peacock arwes bright and keen, Under his belt he bare full thriftily: Wel coude he dreffe his takel yewmanly, His arwes drouped not with fetheres lowe, And in his hand he bare a mighty bowe, A not hed hadde he, with broune vifage, Of wood craft coude he wel all the usage; Upon his arms he had a gai bracer, And by his fide a fwerd and a bokeler, And on the other fide a gaie daggere Harneised wel, and sharp as pointe of spere: A cristofre on his breast of silver shene, An horn he bare, the baudrik was of grene, A forester was he sothely as I gesse.

Though archery continued to be encouraged by the king and legislature for more than two centuries after the first knowledge of the effects of gunpowder, yet by the latter end of the reign of Henry VIII. it feems to have been partly confidered as a pastime. Aithur, the elder brother of Henry. is faid to have been fond of this exercise, insomuch that a good shooter was slyled Prince Arthur. We are also informed, that he pitched his tent at Mile End in order to be present at this recreation, and that Henry his brother also attended. When the latter afterwards became king, he gave a prize at Windfor to those who should excel in this exercise; and a capital shot having been made, Henry said to Barlow (one of his guards), " If you still wan, you shall be duke over all archers." Barlow therefore having succeeded, and living in Shoreditch, was created duke thereof. Upon another occasion, Henry and the queen were met by 200 archers on Shooter's hill, which probably took its name from their affembling near it to flioot at marks. This king likewise gave the first charter to the Artillery Company in the 29th year of his reign, by which they are permitted to wear dreffes of any colour except purple and scarlet, to shoot not only at marks but birds, if not pheafants or herons, and within two miles of the royal palaces. They are also enjoined by the same charter not to wear furs of a greater price than those of the martin. The most material privilege, however, is, that of indemnification from murder, if any person passing between the shooter and the mark is killed, provided the archers have first called out faft.

The following description of an archer, his bow, and accontrements, is given in a MS, written in the time of Queen Elizabeth. " Captains and officers should be skilful of that most noble weapon, and to see that their foldiers according to their draught and ftrength have good bowes, well nocked, well strynged, everie flrynge whippe in their nocke, and in the myddes rubbed with wax, brafer and shuting glove, some spare strynges trymed as aforefaid, every man one shefe of arrows, with a case of leather describble against the rayne, and in the fame fower and twentie arrowes, whereof eight of them should be lighter than the residue, to Archery, gall or aftoyne the enemye with the hailshot of light arrows, before they shall come within the danger of their harquebus shot. Let every man have a brigandine, or a little cote of plate, a skull or hufkyn, a mawle of leade of five foote in lengthe, and a pike, and the same hanging by his girdle, with a hook and a dagger; being thus furnished, teach them by musters to marche, shoote, and retire, keepinge their faces upon the enemy's. Sumtyme put them into great nowmbers, as to battell apparteeneth, and thus use them often times practifed, till they be perfecte; ffor those men in battell ne skirmish can not be spared. None other weapone maye compare with the same noble weapon."

The long bow, as already observed, maintained its place in our armies long after the invention of fire arms. Nor have there been wanting experienced foldiers who were advocates for its continuance, and who in many cases even preferred it to the harquebuss or musket. King Charles I. twice granted special commissions under the great feal for enforcing the use of the long bow. The first was in the 4th year of his reign: but this was revoked by proclamation four years afterwards, on account of divers extortions and abuses committed un-der function thereof. The second, anno 1633, in the oth year of his reign, to William Neade and his fon, also named William, wherein the former is styled an ancient archer, who had prefented to the king a warlike invention for uniting the use of the pike and bow, feen and approved by him and his council of war; wherefore his majefty had granted them a commission to teach and exercise his loving subjects in the laid invention, which he particularly recommended the chief officers of his trained bands to learn and practile; and the jullices and other chief magnificates throughout England, are therein enjoined to use every means in their power to affilt Neade, his fon, and all perfons authorized by them in the furtherance, propagation, and practice of this ufeful invention. Both the commissions and proclamation are printed at large in Rymer. At the breaking out of the civil was, the earl of Effex issued a precept, dated in November 1643, for ftirring up all well affected people by benevolence, towards the raifing a company of archers for the fervice of the king and parliament.

Archery with the long bow continues to be used as a manly exercise by the inhabitants of Geneva, and in many parts of Flanders; nor is it totally neglected in Great Britain. There are several societies of archers in England; the chief of which are, the Woodnen of Arden, and the Toxophilite. But the most noted society of this kind, now exilting, is

The Royal Company of Archers in Scotland .- The ancient records of this Company having been deftroyed by fire about the beginning of the present century, no authentic traces of their institution now remain. It is faid that they owe their origin to the commissioners appointed in the reign of James I. of Scotland for enforcing and overfeeing the exercise of archery in different counties. Those commissioners, who were in general men of rank and power, picking out amongst the better fort of people under their cognizance the most expert archers, formed them into a company, and upon pe-

Archery. rilous occasions made a present of their services to the king as his chief body guards; in which fituation they often diffinguished themselves for their loyalty, their comage, and skill in archery. This rank of the king's principal body guards the Royal Company still claim, within feven miles of the metropolis of Scotland.

> ·Certain it is, that by an act of the privy council of Scotland, in 1677, this Company was recognized under the name and title of "His Majesty's Company of Archers:" and by the same act a piece of plate of the value of 20l. sterling was ordered to be given to be shot for by them at their annual parades, called WEAPON-shawings, and to be called The King's Prize.

> At this period the Royal Company confifted, as it does at prefent, of the principal nobility and gentry of Scotland. But their unfortunate attachment to anti-revolution principles, upon that event's taking place, put almost a period to their existence: Their public parades or marches were discontinued, and the royal prize was withheld.

> Upon the accession of Queen Anne, their former fplendour was revived; and in the year 1703 they obtained a royal charter, confirming in general terms all their former rights and privileges, and conferring others upon them. But their partiality to the family of Stuart was at various after-periods the cause of a temporary prosperity and decline.

> These unhappy differences of opinion having totally fubfided, the Royal Company are now more numerous and flourishing than ever, and perhaps even more dexterous archers. His present majesty, as a mark of his royal patronage and approbation, has been pleased to revive the royal prize, which for the first time was That for upon the 28th of July 1788 by a numerous and respectable meeting

> The Woodmen of Arden and the Toxophilite have lately been pleafed to admit the members of the Royal Company to the freedom of their focieties: these grants have been followed by reciprocal diplomas from the Royal Company; fo that the three chief focieties of archers in Britain may be faid to be now incorporated

> The prizes belonging to this Company, and which are annually shot for, are, 1. A silver arrow, given by the town of Musselburgh, which appears to have been shot for as early as the year 1603. The victor in this, as in the other prizes, except the king's prize, has the custody of it for a year, then returns it with a medal appended, on which are engraved any motto and device which the gainer's fancy dictates. 2. A filver arrow given by the town of Peebles, A. D. 1626. 3. A. filver arrow given by the city of Edinburgh, A. D. 1709. 4. A filver punch bowl of about the value of tol. made of Scottish silver at the expence of the Company, A. D. 1720. And, 5. The king's prize above mentioned, which becomes the absolute property of the winner. All these prizes are shot for at what is termed Rovers, the marks being placed at the distance of 185 yards.

Besides these, there is another prize annually contended for at butt or point-blank diffance, called the Goofe. The ancient manner of shooting for this prize was, a living goofe was built in a turf butt, having the head only exposed to view; and the archer who Archery. first hit the goose's head was entitled to the goose as' his reward. But this cultoin, on account of its barbarity, has been long ago laid afide; and in place of the goofe head, a mark of about an inch diameter is affixed upon each butt, and the archer who first hits this mark is captain of the butt shooters for a year.

The affairs of the Company are managed by a prefes and fix counfellors, who are chosen annually by the whole members. The council are vefted with the power of receiving or rejecting candidates for admiffion, and of appointing the Company's officers civil and

military.

The Royal Company now confifts of above 1000 members, among whom are most of the Scottish nobility of the first distinction. A number of the Company meet weekly during the fummer feafon at Edinburgh, in the Meadows, where they exercife themselves in shooting at butts or rovers: And in the adjoining ground they have a handsome building, erected within thefe 12 years, with fuitable offices, whither they adjourn after their exercise, and where they hold their elections and other meetings relative to the business of the fociety.

The uniform of the Royal Company of Archers is tartan, lined with white, and trimmed with green and white fringes; a white fash, with green tossels; and a blue bonnct, with a St Andrew's cross and feathers. The Company have two standards. The first of these bears on one fide Mars and Cupid encircled in a wreath of thiftles; with this motto, " In peace and war." On the other, a yew tree, with two men dreffed and equipped as archers, encircled as the former; motto, Dai gloria vires. The other flandard displays, on one fide, a lion rampant gules, on a field or, encircled with a wreath ; on the top, a thiftle and crown; motto, Nemo me impune lacesset. On the other, St Andrew on the cross,

on a field argent; at the top, a crown; motto, Dulce

pro patria periculum.

ARCHES COURT, in English ecclesiastical polity, is a court of appeal, belonging to the archbishop of each province; whereof the judge is called the dean of the arches, because he anciently held his court in the church of St Mary le bow (Santia Maria de arcubus), though all the principal spiritual courts are now holden at Doctors Commons. His proper jurisdiction is only over the 13 peculiar parishes belonging to the archbishop in London, but the office of dean of the arches having been for a long time united with that of the archbishop's principal office, he now, in right of the last-mentioned office, receives and determines appeals from the fentences of all inferior ecclefiaftical courts within the province. And from him there lies an appeal to the king in chancery (that is, to a court of delegates appointed under the king's great feal), by flatute 25th Hen. VIII. c. 19. as supreme head of the English church, in the place of the bishop of Rome, who formerly exercised this jurisdiction; which circumstance alone will furnish the reason why the Popish clergy were fo anxious to separate the spiritual court from the temporal.

ARCHETYPE, the first model of a work, which is copied after to make another like it .- Among minters, it is used for the standard weight by which the oArchil.

Archeus there are adjusted .- The archetypal world, among Platonists, means the world as it existed in the idea of God before the visible creation.

> ARCHEUS, from mexis, the principal, chief, or first mover); a fort of primum mobile set up by Helmont, to superintend the animal economy, and preferve it. It is akin to Plato's anima mundi.-Hippocrates uses the words account overs; to fignify the former healthy flate before the attack of the disease.

> ARCHIACOLYTHUS (from aggos, chief, and anolulos, minister), an ancient dignity in cathedral churches: the ministers whereof were divided into four orders or degrees, viz. priefts, deacons, fubdeacons, and acolythi; each of which had their chiefs. The chief of the acolythi was called archiacolythus.

> ARCHIATER, ARCHIATRUS, properly denotes chief physician of a prince who retains several. word is formed of aexn, principium, "chief;" and wrees,

medicus, a "physician."

ARCHIDAPIFER, (from nexos, and dapifer, " fewer,") or chief fewer, is a great officer of the empire. The elector of Bavaria is archidapifer. palatine of the Rhine at one time pretended this office was annexed to his palatinate; but he has fince defisted.

ARCHIEROSYNES, in the Grecian antiquity, a high priest vested with authority over the rest of the priests, and appointed to execute the more facred and mysterious rites of religion.

ARCHIGALLUS, in antiquity, the high priest of Cybele, or the chief of the eunuch priests of that god-

defs, called Galli.

ARCHIGERONTES (from wexes, and yeque, old), in antiquity, the chiefs or masters of the several companies of artificers at Alexandria. Some have mistaken the archigerontes for the arch-priests appointed to take the confessions of those who were condemned to the mines.

ARCHIGUBERNUS, ARCHIGUBERNETA, or Archigubernites, in antiquity, the commander of the imperial ship, or that which the emperor was aboard of. Some have confounded the office of archigubernus with that of prafectus classis, or admiral, but the former was under the command of the latter. Potter takes the proper office of the archiguberneta to have been, to manage the marine affairs, to provide commodious harbours, and order all things relating to the failing of the fleet, except what related to war.

ARCHIL, ARCHILLA, ROCELLA, ORSIELLE, is a whitish moss which grows upon rocks, in the Canary and Cape de Verd islands, and yields a rich purple tincture, fugitive indeed, but extremely beautiful. This weed is imported to us as it is gathered. Those who prepare it for the use of the dyer, grind it betwixt flones, so as to thoroughly bruise, but not to reduce it into powder; and then moisten it occasionally with a ftrong spirit of urine, or urine itself mixed with quicklime: in a few days it acquires a purplish red, and at length a blue colour. In the first state it is called Archil; in the latter, Lacmus or Litmafe.

The dyers rarely employ this drug by itself, on account of its dearness and the perishableness of its beauty. The chief use they make of it is, for giving a bloom to other colours, as pinks, &c. This is effect, ed by passing the dyed cloth or filk through hot wa- Archit ter lightly impregnated with the archil. The bloom thus communicated foon decays upon exposure to the Archilochu air. Mr Hellot informs us, that by the addition of a little folution of tin, this drug gives a durable dye; that its colour is at the same time changed towards a fearlet; and that it is the more permanent in proportion as it recedes the more from its natural colour.

Prepared archil very readily gives out its colour to water, to volatile spirits, and to spirit of wine; it is the substance principally made use of for colouring the spirits of thermometers. As exposure to the air deflroys its colour upon cloth, the exclusion of the air produces a like effect in these hermetically sealed tubes, the spirits of large thermometers becoming in the compass of a few years colourless. M. l'Abbé Nollet obferves (in the French Memoirs for the year 1742), that the colourless spirit, upon breaking the tube, soon refumes its colour, and this for a number of times fuccessively; that a watery tincture of archil, included in the tubes of thermometers, lost its colour in three days; and that, in an open deep vessel, it became colourless at the bottom, while the upper part retained its colour. See Colour Making, No 38.

A folution of archil in water, applied on cold marble, stains it of a beautiful violet or purplish blue colour, far more durable than the colour which it communicates to other bodies. M. du Fay fays he was feen pieces of marble stained with it, which in two years had suffered no sensible change. It finks deep into the marble, fometimes above an inch; and at the fame time spreads upon the surface, unless the edges be bounded by wax or other like fubitances. It feems to make the marble fomewhat more brittle.

Linnæus informs us, in the Swedish Transactions for the year 1742, that the true archil moss is to be found on the western coasts of England. It has been for a confiderable time past prepared by Messrs Gordons at Leith, from a species found in the Highlands of Scotland.

ARCHILOCHIAN, a term in poetry, applied to a fort of verses, of which Archilochus was the inventor, confifting of feven feet; the four first whereof are ordinarily dactyls, though fometimes spondees; the three last trochees, as in Horace,

Solvitur acris hyems, grata vice veris et Favoni.

ARCHILOCHUS, a famous Greek poet and mufician, was, according to Herodotus, cotemporary with Candaules and Gyges, kings of Lydia, who flourished about the 14th Olympiad, 724 years before Christ. But he is placed much later by modern chronologists; viz. by Blair 686, and by Priestley 660 years, before

He was born at Paros, one of the Cyclades. His father Teleficles was of so high a rank, that he was chofen by his countrymen to consult the oracle at Delphos concerning the fending a colony to Thafos: a proof that he was of one of the most distinguished families upon the island. However, he is said to have fullied his birth by an ignoble marriage with a flave called Enipo, of which alliance our poet musician was the fruit.

Though Archilochus showed an early genius and attachment to poetry and music, these arts did not pre-

vent his going into the army, like other young men of his birth; but in the first engagement at which he was present, the young poet, like Horace, and like our own Suckling, loft his buckler, though he faved his life by the help of his heels. It is much eafter, faid he, to get a new buckler than a new existence. This pleasantry, however, did not fave his reputation; nor could his poetry or prayers prevail upon Lycambes, the father of his miltress, to let him marry his daughter, though the had been long promifed to him. After these mortifications, his life feems to have been one continued tiffue of difgrace and refentment.

Archilochum proprio rabies armavit iambo.

Hor. Art. Poet. 79.

Archilochus, with fierce refentment warm'd, Was with his own fevere iambics arm'd. FRANCIS.

The rage of Archilochus was proverbial in antiquity; which compared the provoking this fatirist to the treading upon a serpent: A comparison not very severe, if it be true that Lycambes, and, as fome fay, his three daughters, were so mortified by his fatire, as to be driven to the confolation of a halter.

In this piece, many adventures are mentioned, full of defamation, and out of the knowledge of the public. There were likewise many loose passages in it; and it is faid to have been on account of this fatire that the * Pal. Max. Lacedemonians laid a prohibition on his verses *.

Lib. 6. c. 3. However, according to Plutarch, there is no bard of antiquity by whom the two arts of poetry and music have been fo much advanced as by Archilochus. him is attributed particularly the fudden transition from one rhythm to another of a different kind, and the manner of accompanying those irregular measures upon the lyre. Heroic poetry, in hexameter verse, seems to have been folely in use among the more ancient poets and muficians; and the transition from one rhythm to another, which lyric poetry required, was unknown to them; fo that if Archilochus was the first author of this mixture, he might with propriety be styled the Inventor of Lyric Poetry, which, after his time, became a species of versification wholly distinct from heroic.-To him is likewise ascribed the invention of Epodes. See Erode.

Our poet-musician is generally ranked, among the full victors of the Pythic games: and we learn from Pindar, that his muse was not always a termagant; for though no mortal escaped her rage, yet she was at times sufficiently tranquil and pious to dictate hymns in praise of the gods and heroes. One in particular, written in honour of Hercules, acquired him the acclamations of all Greece; for he fung it in full affembly at the Olympic games, and had the fatisfaction of receiving from the judges the crown of victory consecrated to real merit. This hymn, or ode, was afterwards fung in honour of every victor at Olympia, who had no poet weclebrate his particular exploits.

chus was at last slain by one Callondax Co-island of Naxos; who, though he did it in ray illand of Naxos; who, though he did he he fight, according to the laws of war, was driven out of the temple of Delphi, by command of the oracle, for having deprived of life a man confecrated to the Muses.

The names of Homer and Archilochus were equally revered and celebrated in Greece, as the two most excellent poets which the nation had ever produced. This Archimsappears from an epigram in the Anthologia; and from Cicero, who ranks him with poets of the first class, and in his Epittles tells us, that the grammarian Arittopha-Archimedes nes, the most rigid and scrupulous critic of his time, used to say, that the longest poem of Archilochus always appeared to him the most excellent.

ARCHIMAGUS, the high priest of the Persian Magi or worshippers of fire. He resided in the highest fire temple; which was had in the same veneration with them as the temple of Mecca among the Mahometans. Zoroaster first settled it at Balch; but after the Mahometans had overrun Perfix in the 7th century, the Archimagus was forced to remove from thence into Kerman, a province of Persia, lying on the southern ocean, where it hath continued to this day. Darius Hystaspes took upon himself the dignity of Archimagus: for Porphyry tells us, he ordered before his death, that, among the other titles, it should be engraven on his monument, that he had been Mafter of the Magi; which plainly implies that he had borne this office among them, for none but the Archimagus was master of the whole sect. From hence it feems to have proceeded, that the kings of Persia were ever after looked on to be of the facerdotal tribe, and were always initiated into the facred order of the Magi, before they took on them the crown, and were inaugurated into the kingdom.

ARCHIMANDRITE, in ecclefialtical history, was a name given by the ancient Christians to what we now call an abbot. Father Simon observes, that the word mandrite is Syriac, and fignifies a solitary

ARCHIMEDES, a celebrated geometrician, born at Syracuse in the island of Sicily, and related to Hiero king of Syracuse. He was remarkable for his extraordinary application to mathematical studies; in which he used to be so much engaged, that his servants were often obliged to take him from thence by force. He had such a surprising invention in mechanics, that he affirmed to Hiero, if he had another earth, whereon to plant his machines, he could move this which we inhabit. He is faid to have formed a glass sphere, of a most surprising workmanship, wherein the motions of the heavenly bodies were represented. He discovered the exact quantity of the filver which a goldsmith had mixed with the gold in a crown he had made for the king: he had the hint of this discovery from his perceiving the water rife up the fides of the bath as he went into it, and was filled with fuch joy, that he ran naked out of the bath, crying, " I have found it! I have found it !" By the invention of machines, he, for a long time, defended Syracuse on its being besieged by Marcellus (See Syracuse). On the city's being taken, that general commanded his foldiers to have a particular regard to the fafety of this truly great man; but his care was ineffectual. " What gave Marcellus the greatest concern (says Plutarch), was the unhappy Archimedes, who was at that time in his museum, and his mind, as well as his eyes, so fixed and intent upon fome geometrical figures, that he neither heard the noise and hurry of the Romans, nor perceived the city was taken. In this depth of study and contemplation, a foldier came fuddenly upon him, and commanded him

· Tufcul.

Archime- to follow him to Marcellus; which he refufing to do till he had finished his problem, the foldier, in a rage, drew his fword, and ran him through the body." Others have related the circumstances of his death in a somewhat different manner. It however happened 208 years before the Christian era. Cicero, when he was quæstor in Italy, discovered his tomb, on which was carved a cylinder and fphere *. Some of the works of Durft leiv. this great mathematician are loft, but others are preferved. His pieces which remain are, 1. Two books of the Sphere and Cylinder. 2. The Dimensions of a Circle. 3. Of Centres of Gravity, or Æquiponderants. 4. Of Spheroids and Conoids. 5. Of Spiral Lines. 6. The Quadrature of a Parabola. 7. Of the Number of the Sand. 8. Of Bodies that float on Fluids. The best edition of these is that published at London, in 1675, 4to. Among the works of Archimedes which are loft, we may reckon the descriptions of the following inventions, which we may gather from himfelf and other ancient authors. I. Hegi The superne, or his account of the method which he used to discover the mixture of gold and filver in the crown. 2 His description of the Koxhie, or Koxhier, an engine to draw water out of places where it is stagnated. Atheneus, speaking of the prodigious ship built by the order of Hiero, tells us, that Archimedes invented the cochlion, by means of which the hold, notwithstanding its depth, could be drained by one man. (Augreropesus, lib. v.) Diodorus Siculus informs us (lib. v.) that he contrived this machine to drain Egypt, and that by a wonderful mechanism it would empty the water from any depth. 3. The Eng, by means of which (according to Athenæus, Aurros, lib. v.) he launched Hiero's great ship. 4. The Teremore, of the power of which Tzetzes gives a hyperbolical relation, Chil. ii. hist. 35. 5. The machines he used in the defence of Syracuse against Marcellus.

Of these we have an account in Polybius, Livy, and Archipe Plutarch. 6. His burning-glasses with which he is said to have fet fire to the Romangalleys. Galen, The remoter, Architect lib. iii. 7. His pneumatic and hydraulic engines, concerning which he wrote books, according to Tzetzes, Chil. ii. hist. 3

ARCHIPELAGO, in geography, a general term fignifying a fea interrupted with illands; it is however more especially applied to that lying between Europe and Afia, which contains the islands anciently called Cyclades and Sporades. See these two words.

ARCHIPHERACITÆ, ministers in the Jewish fynagogues appointed to read and interpret the Perakim, or titles and heads of the law and the pro-

ARCHPRESBYTER, or ARCH-PRIFET, a priefl eltablished in some dioceses with a superiority over the reft. He was anciently chosen out of the college of prefbyters at the pleature of the bishop. These archpresbyters were much of the same nature with deans in the cathedral churches, as the college of prefbyters answers to the chapter. See Pressytter.

ARCHISYNAGOGUS, the chief of the fynagogue; the title of an officer among the Jews, who prefided in their fynagogues and affemblies. The number of these officers was not fixed, nor the same in all places; there being 70 in some, and in others only one. They are fometimes called princes of the iyaagogue, and had a power of excommunicating fuch as deferred that punishment.

ARCHITECT, a person skilled in architecture, or the art of building; who forms plans and defigns foredifices, conducts the work, and directs the feveral artificers employed in it. The word is derived from eexos, princeps, and textor, faber, " workman; q. d. the principal workman.

R H TURE,

N the utmost latitude of the word, fignifies the art of building in general; but the term is most frequently applied only to the construction of such buildings as are necessary for the purposes of civil life, such as houses, churches, halls, bridges, porticos, &c.

History of Architecture.

THE origin of this art, like that of most others, is totally unknown. We are affured, however, that it is as old as Cain: for Mofes tells us that he built a city; though what were the materials, or how the buildings were constructed, we are entirely ignorant. It is commonly faid, that the first materials employed in building were irst used in branches and twigs of trees, wherewith men constructed huts; fuch as the wigwams in use among the American Indians at prefent. This, however, appears disputable. The natural shelter afforded by hollows in the fides of mountains or rocks, it may be supposed, would much more readily suggest the idea of using stones and earth as materials for building houses. Indeed, confidering that tents were not invented before the days of Jabal, Tubal-Cain's brother, it is very probable that such temporary houses as the Indian wig-Vol. II. Part I.

wams were not originally known; otherwife the method of covering poles with the fkms of heads, inflead of fmall branches or twigs, must very soon have taken place. These temporary houses seem to have come into use only when men began to lead an idle wandering life, like the Tartars, and could not be at the trouble of conflructing durable habitations in every place where they were obliged to wander with then cattle; and Jabal perhaps from them took the hint of making portable houses or tents. Accordingly we see, that no nations, except those who are in a perpetually unsettled flate, make use of such wretched materials. Even in America, where the human race has appeared in the rudest form, they were no fooner collected into great bodies under the emperors of Mexico and Peru, than stone buildings began to be erected.

We are not, therefore, to look for the origin of erchitecture in any fingle nation; but in every nation, when the inhabitants began to leave off their favage way of life, and to become civilized; and if there is any nation to be found which hath been always in a civilized state, we may be affured that architecture hath always had an existence there. But whatever may be in this, the origin of regular buildings hath been de-

Materials puilding.

Εe

Primitive inte. Plate XXXIV. fig. 1.

duced from the construction of the meanest huts in a very natural and plaufible manner by feveral authors. " Anciently (fays Vitruvius) men lived in woods, and inhabited caves; but in time, taking perhaps example from birds, who with great industry build their nests, they made themselves huts. At first they made these huts, very probably, of a conic figure; because that is a figure of the simplest structure; and, like the birds, whom they imitated, composed them of branches of trees, spreading them wide at the bottom, and joining them in a point at the top; covering the whole with reeds, leaves, and clay, to screen them from tempelts and rain.

Their im-

XXXIV. fig. 2.

Fig. 3.

" But finding the conic figure inconvenient on acprovement, count of its inclined fides, they changed both the form and construction of their huts, giving them a cubical figure, and building them in the following manner: Having marked out the space to be occupied by the hut, they fixed in the ground feveral upright trunks of trees to form the fides, filling the intervals between them with branches closely interwoven and covered with clay. The fides being thus completed, four large beams were placed on the upright trunks; which, being well joined at the angles, kept the fides firm, and likewife ferved to support the covering or roof of the building, composed of many joilts, on which were laid feveral beds of reeds, leaves, and clay.

> "Infentibly mankind improved in the art of building, and invented methods to make their huts lasting and handsome as well as convenient. They took off the bark, and other unevennesses, from the trunks of trees that formed the fides; raifed them, probably above the dirt and humidity, on stones; and covered each of them with a flat stone or slate, to keep off the rain. The spaces between the ends of the joists were closed with clay, wax, or fome other fubstance; and the ends of the joils covered with thin boards cut in the manner of triglyphs. The position of the roof was likewife altered: for being, on account of its flatnels, unfit to throw off the rains that fell in great abundance during the winter feafon, they raifed it in the middle; giving it the form of a gable roof, by placing rafters on the joifts, to support the earth and other materials that composed the covering.

" From this simple construction the orders of architecture took their rife. For when buildings of wood were let aside, and men began to erect solid and stately edifices of stone, they imitated the parts which neceffity had introduced into the primitive huts; infomuch that the upright trees, with the stones at each end of them, were the origin of columns, bases, and capitals, and the beams, joists, rafters, and strata of materials that formed the covering, gave birth to architraves, frizes, triglyphs, and cornices, with the corona, the mutules, the modillions, and the dentils.

" The first buildings were in all likelihood rough and uncouth; as the men of those times had neither experience nor tools: but when, by long experience and reasoning upon it, the artists had cliablished certain rules, had invented many instruments, and by great practice had acquired a facility in executing their ideas, they made quick advances towards perfection, and at length discovered certain manners of building, which fucceeding ages have regarded with the highest veneration."

Among the ancient Egyptians, Assyrians, and Perfians, this art was carried to an incredible length, State of ar-The pyramids of Egypt are such structures as would among the exceed the power of the most potent monarch on earth Egyptians to raise at this day. The largest of these, according to the account of M. Gognet, is near 500 feet high, and contains 313,590 folid fathoms. It is compoled of stones enormoully large; many of them being 30 feet long, four feet high, and three in breadth; and all this huge mass of building was coated over with fquare flags of marble-The structure called the ladyrinth, in the fame country, according to Herodotus, who faw it, excelled every thing which he could have conceived from the imagination either of himfelf or others. Within the same circuit of walls they had enclosed 3000 halls, 12 of which were of a fingular form and beauty; and of these, half were above, and half below ground; and the whole was terminated by a pyramid 40 fathoms high. All this prodigious mass of building was composed of white marble, and the walls were adorned with engravings .- The obelisks were not less astonishing; the largest of them being entire pieces of granite, no less than 180 feet high.-Near Andera, in Upper Egypt are the ruins of a palace of gray granite, the ciclings of which are supported by columns of fuch thickness, that four men can scarcely fathom them. The ciclings themselves are composed of stones of the same kind, six or seven feet in breadth and 18 feet in length. The grand hall is 112 feet long, 60 high, and 58 broad. The roof of the whole edifice is a terrace, on which the Arabs formerly built a very large village, the ruins of which are still visible.

Among the Babylonians and Persians, too, such im- Among the mense piles of building have been raised, as appear ut-Babyloniterly inconceivable and incredible to many modern an- ans and thors where their former grandeur is not demonstrable Persians. by ruins visible at this day. The ruins of Persepolis, the ancient capital of Persia, were so stupendous in the time of Avicenna the Arab phylician, that his countrymen could not believe fuch structures possible to be erected but by evil spirits. Of their extraordinary magnificence, indeed, we may have some idea from the account of the staircases belonging to the palace. The remains, some time ago, consisted of 95 steps of white marble, fo broad and flat, that 12 horses might conveniently go up abreaft.

In these valt structures, however, the nations of whom Their build. we fpeak feem to have regarded the greatness, ratherings more than the elegance or usefulness of their works. In the remarkable pyramids and obelisks of Egypt this is exceedingly for greatconfpicuous; but whether it was fo in the labyrinth or legance. in the palace at Thebes above mentioned, it is imposfible to determine, unless the buildings were entire, and we knew for what purpose they had been defigned. If the kings who built the pyramids defigned to immortalize their memories by building, they certainly could not have fallen upon any thing more proper for this purpose; though even in this they have somehow or other failed, the names of those who crected them not being certainly known even in the time of Herodotus .-It is certain, however, that neither the ancient Affy-Ignorant a rians nor Babylonians knew the method of construct-the use of ing arches. The roofs of all their halls were flat, and arches, covered with prodigiously large slones, some of them fo big as to cover a whole room fingly. Their manner

columns.

Origin of the Doric order.

of building was also quite destitute of what is now called tafte; the columns were ill proportioned, and their capitals executed in the poorest manner imaginable. This was observed by the Greeks, who improved upon the proportions formerly used, and were the inventors of three of the five orders of architecture, and of pro- viz. the Doric, Ionic, and Corinthian. "Anciently portioning (fays Vitruvius) they were ignorant of the art of proportioning the various parts of a building: they used columns; but they cut them at hazard, without rules, without principles, and without having any attention to the proportions which they ought to give them: they placed them likewife without any regard to the other parts of the edifice. Dorus, fon of Helen and grandson of Deucalion, having caused a temple to be built at Argos in honour of Juno, that edifice was found by chance to be constructed according to the taile and proportions of the order which afterwards they called Doric. The form of this building having appeared agreeable, they conformed to it for the construction of edifices which they afterwards had to

> " About the same time, the Athenians sent into Afia a colony under the conduct of Ion, nephew of Dorus: this undertaking had very good fuccefs. Ion feized on Caria, and there founded many cities : thefe new inhabitants thought to build temples. They proposed for a model that of Juno at Argos; but, ignorant of the proportion which they ought to give to the columns, and in general to the whole edifice, they fought for rules capable of regulating their operation. These people wanted, in making their columns sufficiently strong to support the whole edifice, to render them at the same time agreeable to the fight. For this purpole, they thought to have given it the same proportion that they found between the foot of a man and the rest of his body. According to their ideas, the foot made a fixth part of the human height: in consequence, they gave at first to a Doric column, taking in its chapiter, fix of its diameters; that is to fay, they made it fix times as high as it was thick: afterwards they added to it a seventh diameter.

"This new order of architecture was not long in fthe Ionic. riving birth to a fecond; they would immediately go beyond their first invention. The Ionians tried to beyond their first invention. throw still more delicacy and elegance into their edifices. They employed the fame method which they had before put in practice for the composition of the Doric order: but instead of taking for a model the body of a man, the Ionians were regulated by that of a woman. With a view to make the columns of this new order more agreeable and more pleasing, they gave them eight times as much height as they had diameter. They also made charnelings all along the trunk to imitate the folds of the robes of women; the volutes of the chapiter represented that part of the hair which bung in curls on each fide of the face. The Ionians added, laftly, to these colurns a base, which was not in use in the Dorie order." According to Vitravius, these bases were made in the mantier of twisted cords, as a kind of case for the columns. This order of architecture was called Ionic, from the name of the people who had invented it.

Such is the account given by Vitruvius of the origin of improvements in the proportion of columns. Had these improvements, however, existed in such early times, Homer, who was greatly posterior to them, would certainly have made mention of fomething of that kind; but in all his writings he gives us no account of any thing like columns of stone, but uses a word which would rather incline us to think that his columns were nothing more than bare posts.

It is remarkable, that improvements in architecture Hintsofimdid not take place in any nation till after, or about, the provement time that Jerusalem was taken by Nebuchadnezzar. Probably The grandest buildings erected among the Assyrians Solomon's feem to have owed their existence to this monarch; and temple, it can scarce be imagined that he would not endeavour to imitate the architecture of Solomon's temple, to which, by his conquest of Jerufalem he had full access. It is also remarkable, that the dimensions of the two pillars, Jachin and Boaz, fet up by Solomon, very nearly correspond with those of the Doric order, first invented by the Greeks, and which originally came from their colonies fettled in Asia Minor. The height of Solomon's pillars, without the chapiter, was 18 cubits; that of the chapiter itself was five cubits; the circumference was 12 cubits; from whence, according to the Scripture language, we may reckon the diameter to have been exactly four cubits. Had they been a fingle cubit higher, they would have been precifely of the fame height with columns of the original Doric order. We do not indeed mean to affert, that this famous temple gave a model of architecture to the whole world: although it is fearce conceivable but imitations of it, as far as it could be known, muil have taken place among many nations.

Notwithstanding all their defects, however, the E-Egyptian gyptian buildings undoubtedly had an air of vaft gran-barqueting deur and magnificence, if we may credit the description round degiven of one their banqueting rooms by Vitruvius. The usual fize of one of these rooms was from 100 to 150 feet in length, and its breadth somewhat more than half its length. At the upper end, and along the two fides, they placed rows of pillars tolerably well proportioned to one another, though not of any regular order; and at the lower part they made a magnificent and spacious entrance: this, with its ornaments, feems to have taken up one end of the building entire. We are not told that there were any pillars there; though perhaps they placed two or more toward the angles on each fide, for uniformity, the central space being enough for an entrance in the grandest and most august manner. These rows of columns were set at a diffance from the wall, forming a noble portico along the two fides and upper end of the building. Upon the pillars was laid an architrave; and from this was carried up a continued wall with three quarter columns, anfwering directly to those below, and in proportion one fourth smaller in all their parts. Between these three quarter columns were placed the windows for enlightening the building. From the tops of the lower pillars to the wall was laid a floor; this covered the portico overhead within, and made on the outfide a platform, which was furrounded by a corridor with rails and ballusters. This was terraced, and served as a plain for people to walk on; and from this they could look, through the windows down into the room. To this terrace there was no covering required, as the Egyptians were in no fear of rain. The Egyptians decorated this forr of E e 2

building

H T E U R R E.

building with flatues; and no kind of ornament could answer it so well, as the light cannot fall upon statues to fuch advantage in any direction, as when it comes from above, in such a regular, proportioned, and uninterrupted manner. 13

Ancient ar-

We have already taken notice, that among the anthitecture cient Egyptians, Persians, and Babylonians, the vast superior in strength and extent of their buildings seems to have frandeur to been what they chiefly valued; and in this they certhe modern tainly as much excelled the Greeks and modern nations, as the latter excel them in the beautiful proportion and clegance of their fluctures. There are not wanting, however, fome modern authors, who endeavour to deplive the ancients of what is juffly their due, and will have every thing to be exaggerated which feems beyoud the power of modern princes to accomplish. In this way M. Goguet remarkably dulinguishes himself; and that without giving any reason at all, but merely that he takes it into his head. Speaking of the wonders of ancient Babylon, " All thefe works (fays he), fo marvellous in the judgment of antiquity, appear to rie to have been extremely exaggerated by the authors who have spoken of them. How can we conceive, in effect, that the walls of Babylon could have been 318 feet high and 81 in thickness, in a compass of near ten leagues?" To this we may cafily reply, that the Dyramids of Egypt, and the immense wall which diviles China from Tartary, show us, that even such a with as the wall of ancient Babylon is faid to have been is not alrogether incredible. The lowest computation of the dimensions of the Chinese wall is, that it er tends in length 1200 miles, is 18 feet high at a medium and as many thick; according to which comput uses, it mult contain 9,504,000 folid fathoms; and yet, if we may credit the Chinese hiltorians, this ammente mass of building was fanished in five years. If therefore we can suppose Nebuchadnezzar, or whoever fortified the city of Babylon, to have been capable of employing as many mentor to years as were employed in raining the Chinese wall, we may suppose him able to have fortified the city of Babylon as firongly as it is faid to have been; for the mass of building is not quite double that of the Chincle wall, though nearly so, amounting to 18,189,600 fold fathoms. When our author afterwards g deonades about the works of the French king, it is difficult to avoid laughter at hearing him declare, that " infinitely more money has been expended, and much more gentus required, as well as more power, tale, and time, to finish Verfailles, with all its defects, than to conflruct a pyramid, or wrech an obelifk." The genius, tafte, and time, we fhall not dispute; but as the same author confesses that 200,000 men were employed for 30 years together in the configuration of the largest pyramid, we think the power may justly be doubted. This doubt will appear fill the more reasonable, when we consider what time the above-mentioned number of men would have taken to a complish some of the works of which M. Goguet boufts to much. The canal of Languedoc, he tells us, extend, in length upwards of 70 leagues, and required the removal of two millions of cubic fathours of earth. This was no doubt a great work; but had 100,000 men been employed upon it at once, they must have removed this quantity of earth in three weeks, suppol-

ing each to have removed only a fingle fathom a-day.

Nor can we imagine, that any modern work will at all stand in competition with the works of the ancients as to greatness, whatever they may do in other refpects.

As to the improvements in architecture, the Greeks Architecwere undoubtedly the first European nation who began ture improto distinguish themselves in this way. Whence they ved by the took the first hint of improvement, we have no means Greeks. of knowing: though, as we have already hinted, it is fearce credible but that Solomon's temple must have fomewhat contributed thereto; especially as we learn from Scripture, that the capitals of the columns there were ornamented in the richell manner. The origin of the Doric and Ionic orders we have already given an account of from Vitruvius; to which we may add, that the volutes, which are the peculiar ornament of the Ionic capital, are by some faid to represent the natural curling down of a piece of bark from the top of a beam, which is supposed to have been the first kind of column.—The Corinthian order was not invented till Origin of long after the others, and is faid to have taken its tife the Corinfrom the following accident: A basket had been set thian order. upon the ground, and covered with a fquare tile; there grew near it a plant of acanthus or bear's breech; the leaves shot up and covered the outer surface of the basket; and as the stalks rose up among them, they foun reached the tile which overhung the edges of the balket at the top; this flopping their course upwards, they curled and twifted themselves into a kind of volutes. In this fituation a sculptor, Callimachus, saw it; the twifted part of the stalk represented to him the volutes of the Ionic capital, which, as they were here fmaller, and more numerous, appeared in a new form: he faw the beauty of raifing them among leaves, and was struck with the representation of a noble and lofty capital; which being afterwards put into execution, has been univerfally admired.

In their private houses the Greeks had greater conve- Private niences, but much less magnificence, than the Romans, houses of as the former referved the use of their grandest archi-the Gracks. tecture for their temples and public buildings. The entrauce to their private houses, however large they were, was always finall, narrow, and plain. The whole edifice usually confilted of two courts, and feveral ranges of building. The porter's lodge, if such a phrase may be allowed, was usually on the right hand of this narrow entrance, and opposite to this were the stables. From this entrance one came into the first or finaller court. This had plazzas on three fides; and on the fourth, which was usually the fouth fide, there were butments of pilasters, which supported the more inward parts of the ceiling .- A space being thus left between the one and the other, they had places for the lodgings of men and maid fervants, and fuch as had the principal care of the house. Upon the same floor with these butments they had several regular apartments, consisting of an antichamber, a chamber, and closets; and about the piazzas, rooms for eating and other common purpoles.- Upposite to the entrance was a lobby or veitibale, through which lay the passage into the feveral rooms; and through this, in front, one entered a large passage, which led into the larger or principal square. Round this they had four piazzas, which, in the common way of building, were all of one beight; but, in more magnificent houses, they made that which

faced the great entrance loftier, and every way nobler, than the other three. A nobleman of Rhodes added this to the common method of building; and it was thence called the Rhodian manner. In this more noble part of the building were the apartments of the family. These were adorned with losty galleries, and here were the best rooms: they were called the men's apartments; for, in rude times, the Greeks lodged their wives and female relations in the best rooms of the first court, where they had also their separate and detached place. The two fides of this larger court were kept for the reception of vifitors; and fervants were appointed to wait upon them. The master of the house entertained his guests the first day in his own apartments; but after this, how long foever they staid, they lived without restraint in one of those separate piazzas, and joined the family only when they chofe it. Thus was the upper end and two fides of the great court disposed of; and its lower end, being the same range of building that was the upper end of the first court, held the lady of the house and her female friends.

If the Ro-

The Romans borrowed their architecture from the Greeks, but did not imitate them in the modesty of their private dwellings. They placed the principal front of their house towards the south, and on this they bestowed all the decoration of expensive ornament. They had here lofty galleries and spacious rooms, and every thing carried an air of greatness and show. In their country houses they preserved the same situation and the fame front, but the inner diffribution was different. At the entrance they placed the meaner and more offensive offices, after the manner of the Greeks. The first gallery, which received the stranger at his entrance, had on one fide a passage to the kitchen, and on the other to the stalls where they kept cattle, that their noise or smell might not be offensive within, while yet they were in readinc's for all fervices. Thefe stalls were placed to the left, as in the Greek houses; on the right was the kitchen, which had its light from above, and its chinney in the middle. Farther within the building were placed on one fide bathing rooms, and on the other family conveniences, in the manner of our butteries and flore rooms: the bathing rooms were on the left, and the others on the right. Backwards, and full to the north, they placed their cellars, for fear of the fun, and over these were other store rooms. From this part of the structure one came into the court; for in thefe there generally was only one court: this was taken up by fervants, and those who had the care of the cattle; and on each fide there were stalls for the cattle. In front from the entrance, but very far from all these annoyances, stood the nobler apartments for the mafter of the family.

18 Decline of he art anong the Romans.

How magnificent the Romans were in their temples and public buildings, is yet to be feen in what remains of them, and which are not only models for all modern architects, but have never been surpassed or even equalled to this day. But though the art of architecture continued almost at its highest pitch among the Romans for two centuries, it declined exceedingly as the empire began to fail. Tacitus relates, that after the battle of Actium no men of genius appeared; and after the reign of Alexander Severus, a manner of building altogether confused and irregular was introduced, wherein nothing of the true graces and majetty of the

former was preferved. When the empire was entirely overrun by the Goths, the conquerors naturally intro-Gothic duced their own method of building. Like the ancient building. Egyptians, the Goths feem to have been more studious to amaze people with the greatness of their buildings than to pleafe the eye with the regularity of their structure, or the propriety of their ornaments. They corrected themselves, however, a little by the models of the Roman edifices which they faw before them: but these models themselves were faulty; and the Goths being totally destitute of genius, neither architecture nor any other art could be improved by them.

Most writers who mention the ancient buildings in this island, particularly the religious ones, notwithstanding the striking difference in the styles of their construction, class them all under the common denomination of Gothic; a general appellation by them applied to buildings not exactly conformable to some one of the five orders of architecture. Our modern antiquaries, more accurately, divide them into Saxon,-Norman, and Saracenic, or that species vulgarly

though improperly called modern Gothic.

It has been maintained by forne, that the Saxon Of the Sax churches, after they began to be built with flone, con-man flyk fifted only of upright walls, without pillars or arches, the construction of which it is alleged they were entirely ignorant of. But this opinion is not only centradicted by the testimony of several cotemporary or very ancient writers, who expressly mention them both, but also by the remains of some editices universally allowed to be of Saxon workmanship, one of them the ancient conventual church at Ely. Indeed, it is highly improbable that the Saxons could be ignorant of to useful a contrivance as the arch. Many of them, built by the Romans, they must have had before their eyes; fome of which have reached our days: two particularly are now remaining in Canterbury only; one in the caffle yard, the other at Riding gate. And it is not to be believed, that once knowing them and their convenience, they would neglect to make use of them; or having uted, would relinquish them. Befides, as it appears from undoubted authorities they procured workmen from the continent to confiruel their capital buildings " according to the Roman manner," this alone would be fufficient to confute that ill-grounded opinion; and at the fame time proves, that what we commonly call Saxon, is in reality Roman architecture.

This was the flyle of building practifed all over Europe; and it continued to be used by the Normans, after their arrival here, till the introduction of what is called the modern Gothic, which was not till about the end of the reign of Henry II. fo that there feems to be little or no grounds for a diffinction between the Saxon and Norman architecture. Indeed it is faid, the buildings of the latter were of larger dimensions both in height and area; and they were constructed with a stone brought from Cacn in Normandy, of which theirworkmen were peculiarly fond: but this was fimply an alteration in the scale and materials, and not in the manner of the building. The ancient parts of most of our cathedrals are of this early Norman work .- The characteristic marks of this style are these: The walls are very thick, generally without buttreffes; the arches, both within and without, as well as those over the doors and windows, femicircular, and supported by

very folid, or rather clumfy, columns, with a kind of regular bale and capital: in short, plainness and solidity constitute the striking features of this method of building. Nevertheless, the architects of those days fometimes deviated from this rule: their capitals were adorned with carvings of foliage, and even animals; and their massive columns decorated with small half. columns united to them, and their furfaces ornamented with spirals, squares, lozenge net work, and other sigures, either engraved or in relievo. Various inflances of these may be seen in the cathedral of Canterbury, particularly the under croft, the monastery at Lindisfarn or Holy Island, the cathedral at Durham, and the ruined choir at Orford in Suffolk. The columns 1, 1, 1, 1, (Plate XXXIII.), are at the monastery of Lindisfarn or Holy Island. Those 2, 2, 2, belong to the ruined chancel at Orford in Suffolk, No 3 is at Christ church, Canterbury. No 4, a column with two remarkable projections like claws, in the fouth aide of Romsey church, Hampshire.

21 To what country or people the modern Gothic, or Of the modern Gothic the ftyle of building with pointed arches fo called, or Saracenic owes its orgin, seems by no means satisfactorily determined. Some have imagined it may possibly have taken its rife from those areades we see in the early Norman or Saxon buildings or walls, where the wide temicircular arches cross and intersect each other. and form at their intersection a narrow and sharp pointed arch: But it is more generally conjectured to be of Avabian extraction, and to have been introduced into Europe by some persons returning from the Crusades in the Holy Land. Sir Christopher Wren was of that opinion, and it has been subscribed to by most writers

who have treated on this subject.

" Modern Gothic, as it is called (fays Rious), is distinguished by the lightness of its work, by the excessive boldness of its elevations and of its sections; by the delicacy, profusion, and extravagant fancy of its ornaments. The pillars of this kind are as slender as those of the ancient Gothic are massive; such productions, so airy, cannot admit the heavy Goths for their author. How can be attributed to them a ftyle of architecture, which was only introduced in the tenth century of our cra, feveral, years after the deftruction of all those kingdoms, which the Goths had raised upon the ruins of the Roman empire, and at a time when the very name of Goth was entirely forgotten? From all the marks of the new architecture, it can only he atributed to the Moors; or, what is the fame thing, to the Arabians or Saracens, who have expressed, in their architecture, the same talte as in their poetry ; both the one and the other falfely delicate, crowded with superfluous ornaments; and often very unnatural: the imagination is highly worked up in both 7 but it is an extravagant imagination; and this has rendered the edifices of the Arabians (we may include the other orientals) as extraordinary as their thoughts. If any one doubts of this affertion, let us appeal to any one who has feen the mosques and palaces of Fez, or some of the cathedrals in Spain built by the Moors; one model of this fort is the church at Burgos; and even in this island there are not wanting several examples of the same; such buildings have been vulgarly called modern Gothic, but their true appellation is Arabic, Saracenic, or Moresque. This manner was introduced into Europe through Spain. Learning flourished among the Arabians all the time that their dominion was in full power; they studied philosophy, mathematics, physic, and poetry. The love of learning was at once excited; in all places that were not at too great a distance from Spain, these authors were read: and fuch of the Greek authors as they had translated into Arabic, were from thence turned into Latin. The physic and philosophy of the Arabians spread themselves in Europe, and with these their architecture: many churches were built after the Saracenic mode; and others with a mixture of heavy and light proportions, the alteration that the difference of the climate might require, was little, if at all confidered. In most fouthern parts of Europe, and in Africa, the windows (before the use of glass), made with narrow apertures, and placed very high in the walls of the building, occafioned a shade and darkness within side, and were all contrived to guard against the fierce rays of the sun; yet were ill fuited to latitudes where that glorious luminary shades its feebler influences, and is rarely seen

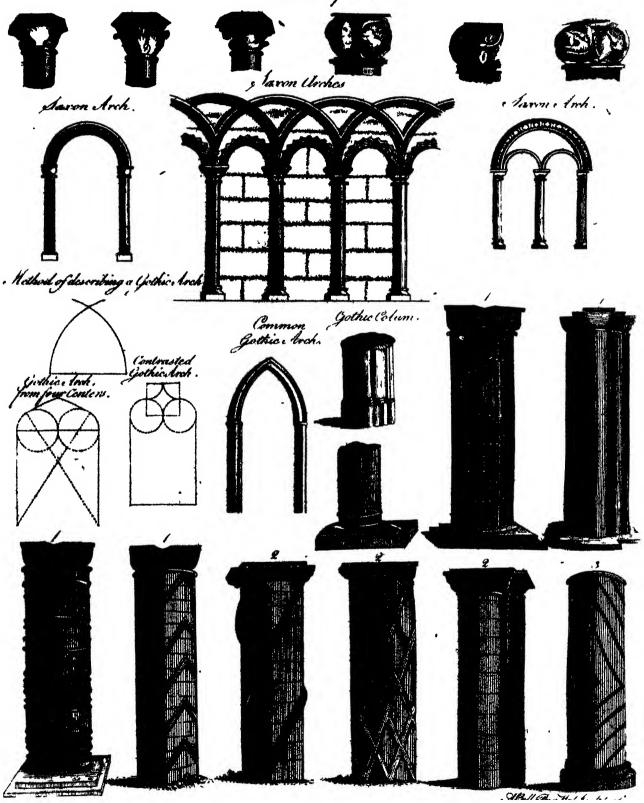

but through a watery cloud."

Mr Grose, however, thinks the above opinion is not fufficiently favoured by the observations of several learned travellers who have accurately furveyed the ancient mode of building in those parts of the world. Thus Cornclius le Brun, an indefatigable and inquilitive traveller, has published many views of eastern buildings, particularly about the Holy Land: in all these, only one Gothic ruin, the church near Acre, and a few pointed arches, occur; and those built by the Christians when in possession of the country. Near Ispahan, in Persia, he gives several buildings with pointed arches: but these are bridges and caravanteras, whose age cannot be afcertained; confequently are as likely to have been built after, as before the introduction of this flyle into Europe. At Ispahan itself, the mey doen, or grand market place, is furrounded by divers magnificent Gothic buildings; particularly the royal mosque, and the Talael Ali-kapie, or theatre. The magnificent bridge of Alla-werdie-chan, over the river Zenderoet, 540 paces long and 17 broad, having 33 pointed arches, is also a Gothic structure; but no mention is made when or by whom these are built. The Chiaer Baeg, a royal garden, is decorated with Gothic buildings; but these were, it is said, built only in the reign of Schah Abbas, who died anno 1629. One building indeed, Mr Grose admits, seems at first as if it would corroborate this affertion, and that the time when it was erected might be in some degree fixed; it is the touch of Abdalla, one of the apostles, of Mahomet, probably him furnamed Abu Becr. " If this tomb (fays he) is supposed to have been built soon as ter his death, estimating that even to have happened according to the common course of nature, it will, place its erection about the middle of the feventh century: but this is by far too conjectural to be much depended on. It also seems as if this was not the common flyle of building at that time, from the temple of Mecca; where, if any credit is to be given to the print of it in Sale's Koran, the arches are femicircu-The tomb here mentioned has one evidence to: prove its antiquity; that of being damaged by the injuries of time and weather. Its general appearance; much resembles the east end of the chapel belonging

ARCHITE CTURE.

Plate XXXIII

Saxon Capitals.

to Ely House, London, except that which is filled up there by the great window: in the tomb is an open pointed arch, where also the columns or pinnacles on each fide are higher in proportion.

As to the supposition that this kind of architecture was brought into Spain by the Moors (who poffeffed themselves of a great part of that country the beginning of the eighth century, which they held till the latter end of the fifteenth), and that from thence, by way of France, it was introduced into Britain; this at first seems plausible: though, according to Mr Grose, the only instance which feems to corroborate this hypothesis, or at least the only one proved by authentic drawings, is the mosque at Cordova in Spain; where, if we may judge from the views published by Mr Swinburne, although most of the arches are circular or horseshoe fashion, there are some pointed arches formed by the intersection of two segments of a circle. This mosque was, as it is there said, begun by Abdoulrahman I. who laid the foundation two years before his death, and was finished by his son Hissem or Iscan about the year 800. If these arches were part of the original structure, it would be much in favour of the supposition; but as it is also said that edifice has been more than once altered and enlarged by the Mahometans, before any well grounded conclusion can be drawn, it is necessary to ascertain the date of the present building.

There are also several pointed arches in the Moorish palace at Granada, called the Alhambra; but as that was not built till the year 1273, long after the introduction of pointed arches into Europe, they are as likely to be borrowed by the Moors from the Christians, as by the Christians from the Moors. The greatest peculiarity in the Moorish architecture is the horse-shoe arch, which containing more than a semicircle, contracts towards its base, by which it is rendered unfit to bear any considerable weight, being solely calculated for ornament. In Romsey church, Hampshire, there are several arches somewhat of that form, one of which is represented in Plate LV1.

In the drawings of the Moorish buildings given in Les Delices de l'Espagne, said to be faithful representations, there are no traces of the style called Gothic architecture: there, as well as in the Moorish castle at Gibraltar, the arches are all represented circular. Perhaps a more general knowledge of these buildings would throw some light on the subject: possibly the Moors may, like us, at different periods have used different manners of building.

The marks which constitute the character of Gothic, or Saracenical architecture, are its numerous and prominent buttresses, its lofty spires and pinnacles, its large and ramified windows, its ornamental niches or canopies, its sulptured faints, the delicate lace work of its fretted roofs, and the profusion of ornaments lavished indiscriminately over the whole building: but its peculiar distinguishing characteristics are, the small clustered pillars and pointed arches formed by the segments of two intersecting circles; which arches, though last brought into use, are evidently of more simple and obvious construction than the semicircular ones; two stat stones, with their tops inclined to each other, and touching, form its rudiments; a number of boughs stuck into the ground opposite each other, and tied to-

gether at the top, in order to form a bower, exactly describe it: whereas a semicircular arch appears the refult of deeper contrivance, as consisting of more parts; and it seems less probable chance, from whence all these inventions were first derived, should throw several wedge-like stones between two set perpendicular, so as exactly to fit and fill up the interval.

Bishop Warburton, in his notes on Pope's Epistles, in the octavo edition, has the following ingenious obfervations on this subject :- " Our Gothic ancestors had juster and mantier notions of magnificence, on Greek and Roman ideas, than these mimics of taste, who profess to study only classic elegance; and because the thing does honour to the genius of those barbarians, I shall endeavour to explain it. All our ancient churches are called without distinction Gothic, but erroneously. They are of two forts: the one built in the Saxon times, the other in the Norman. Several cathedral and collegiate churches of the first fort are yet remaining, either in whole or in part; of which this was the original: When the Saxon kings became Christians, their piety (which was the piety of the times), confifted chiefly in building churches at home, and performing pilgrimages abroad, especially to the Holy Land, and these spiritual exercises assisted and supported one another; for the most venerable as well as most elegant models of religious edifices were then in Palestine. From these the Saxon builders took the whole of their ideas, as may be feen by comparing the drawings which travellers have given us of the churches yet standing in that country, with the Saxon remains of what we find at home; and particularly in that fameness of style in the latter religious edifices of the knights temporals (professedly built upon the model of the church of the Holy Sepulchre at Jerusalem), with the earlier remains of our Saxon edifices. Now the architecture of the Holy Land was Grecian, but greatly fallen from its ancient elegance. Our Saxon performance was indeed a bad copy of it, and as much inferior to the works of St Helena and Justinian, as theirs were to the Grecian models they had followed: yet still the footsteps of ancient art appeared in the circular arches, the entire columns, the divition of the entablature into a fort of architrave, frize, and cornice, and a folidity equally diffused over the whole mass. This, by way of diffinction, I would call the Saxon architecture. But our Norman works had a very different original. When the Goths had conquered Spain, and the genial warmth of the climate and the religion of the old inhabitants had ripened their wits and inflamed their mistaken piety, both kept in exercife by the neighbourhood of the Saracens, through emulation of their service, and aversion to their superstition, they struck out a new species of architecture, unknown to Greece and Rome, upon original principles, and ideas much nobler than what had given birth even to classical magnificence. For this northern people having been accustomed, during the gloom of paganism, to worship the deity in groves (a practice common to all nations); when their new religion required covered edifices, they ingeniously projected to make them refemble groves, as nearly as the distance of architecture would permit; at once indulging their old prejudices, and providing for their prefent conve-

miences, by a cool receptacle in a fultry climate: and with what skill and success they executed the project by the affiftance of Saracen architects, whose exotic fivle of building very luckily fuited their purpose, appears from hence, that no attentive observer ever viewed a regular avenue of well grown trees intermixing their branches overhead, but it prefently put him in mind of the long visto through the Gothic cathedral; or even entered one of the larger and more elegant edifices of this kind, but it prefented to his imagination an avenue of trees; and this alone is what can be truly called the Gothic style of building. Under this idea of fo extraordinary a species of architecture, all the irregular transgressions against art, all the monstrous offences against nature, disappear; every thing has its reason, every thing is in order, and an harmonious whole arifes from the studious application of means proper and proportionate to the end. For could the arches be otherwife than pointed, when the workmen were to imitate that curve which branches of two opposite trees make by their infertion with one another? or could the columns be otherwise than split into distinct shafts, when they were to represent the stems of a clump of trees growing close together? On the same principles they formed the fpreading ramification of the flone work in the windows, and the stained glass in the interstices; the one to represent the branches, and the other the leaves of an opening grove, and both concurred to preferve that gloomy light which infpires religious reverence and dread. Laftly, We fee the reason of their studied avertion to apparent folidity in these stupendous masses, deemed so absurd by men accustomed to the apparent as well as real strength of Grecian architecture. Had it been only a wanton exercise of the artill's skill, to show he could give real strength without the appearance of any, we might indeed admire his superior science, but we must needs condemn his ill judgment. But when one considers, that this surprising lightness was necessary to complete the execution of his idea of a fylvan place of worthip, one cannot fufficiently admire the ingenuity of the contrivance. This too will account for the contrary qualities in what I call the Saxon architecture. These artists copied. as has been faid, from the churches in the Holy Land. which were built on the models of the Grecian architecture, but corrupted by prevailing barbarifm; and still farther depraved by a religious idea. The first places of Christian worthip were sepulchres and subterraneous caverns, low and heavy from necessity. When Christianity became the religion of the state, and sumptuous temples began to be erected, they yet, in regard to the first pious ages, preserved the massive style, made ftill more venerable by the church of the Holy Se-pulchre; where this ftyle was, on a double account, followed and aggravated."

In Britain, before the Roman invation, the natives appear to have had no better lodgings than thickets, dens, and caves. Some of these caves, which were their winter habitations, and places of retreat in time of war, were formed and readered secure and warm by art, like those of the ancient Germans, which are thus described by Tacitus: They are used to dig deep caves in the ground and cover them with earth, where they lay up their provisions, and dwell in winter for the sake of warmth. Into those they retire also from their

enemies, who plunder the open country, but cannot discover these subterranean recesses." Some of the subterraneous, or earth houses, as they are called, are still remaining in the Western isles of Scotland and in Cornwal. The summer habitations of the most ancient Britons were very slight; and, like those of the Finnians, consisted only of a few stakes driven into the ground, interwoven with wattles, and covered over with the boughs of trees.

When Julius Carfar invaded Britain, the inhabitants of Cantium (Kent), and of some other parts in the fouth, had learned to build houses a little more substantial and convenient. " The country (fays Cæsar) abounds in houses, which very much resemble those of Gaul." The first step towards this improvement seems to have been that of daubing the wattled walls of their houses with clay, to fill up the chinks and make them warmer. " The Germans used for this purpose a kind of pure resplendent earth of different colours, which had an appearance of painting at a distance;" but the Gauls and Britons chose rather to whitewash the clay after it was dry with chalk. Instead of the boughs of trees, they thatched these houses with straw, as a much better security against the weather. They next proceeded to form the walls of large beams of wood, instead of stakes and wattles. This seems to have been the mode of building in Britain, when it was first invaded by the Romans. " The Britons (fays Diodorus Siculus, who was cotemporary with Czefar) dwell in wretched cottages, which are confiructed of wood, covered with straw." These wooden houses of the ancient Gauls and Britons were not square but circular, with high tapering roofs, at the top or centre of which was an aperture for the admission of light and emission of smoke. Those of Gaul are thus described by Strabo: "They build their houses of wood, in the form of a circle, with lofty tapering roofs." The foundations of fome of the most magnificent of these circular houses were of stone, of which there are some vestiges still remaining in Anglesey and other places. It was probably in imitation of these wooden houses, that the most ancient stone edifices, of which there are still some remains in the Western islands of Scotland, were built circular, and have a large aperture at the top.

When the Britonswere invaded by the Romans, they had nothing among them answering to our ideas of a city or town, confishing of a great number of contiguous houses disposed into regular streets, lanes, and courts. Their dwellings, like those of the ancient Germans, were feattered about the country, and generally fituated on the brink of fome rivulet for the fake of water, and on the skirt of some wood or forest for the conveniency of hunting and pasture for their cattle. As these inviting circumstances were more conspicuous in some parts of the country than others, the princes and chiefs made choice of these places for their refidence; and a number of their friends and followers, for various reasons, built their houses as near to them as they could with conveniency. This naturally produced an aucient British town, which is described by Cæfar and Strabo in the following manner: " From the Caffi he learnt that the town of Caffivelaun was at no great distance; a place defended by woods and marshes, in which very great numbers of men and cattle were collected. For what the Britons call a town

Ancient rife and progress of architecture in Britain. is a tract of woody country surrounded by a mound and ditch, for the security of themselves and their cattle against the incursions of their enemies." "The forests of the Britons are their cities; for when they have enclosed a very large circuit with selled trees, they build within it houses for themselves and hovels for their cattle. These buildings are very slight, and not designed for long duration." The palaces of the British princes were probably built of the same materials, and on the same plan, with the houses of their subjects, and differed from them only in solidity and magnitude.

Though the communication between this island and the continent was more free and open after the first Roman invasion than it had been before, and some of the British princes and chieftans even visited Rome, then in its greatest glory; it doth not appear that the people of Britain made any considerable improvements in their manner of building for at least a hundred years after that invasion. For when the renowned Charactus was carried prisoner to Rome, A. D. 52, and observed the beauty and magnificence of the buildings in that proud metropolis of the world, he is said to have expressed great surprise, "That the Romans, who had such magnificent palaces of their own, should envy the wretched cabins of the Britons."

It must appear very surprising that the ancient Britons, when they were so ignorant of architecture, were capable of crecting (if indeed it was erected by them) so stupendous a fabric as that of Stonehenge on Salifbury plain: A fabric which hath been the admiration of all succeeding ages, and hath outlasted all the solid and noble structures which were erected by the Romans in this island. See the article Stonehenge.

Of another very extraordinary species of building several remains are found in the Highlands of Scotland. They consist of ruins; the walls of which, instead of being cemented with lime or some other similar substance, or of being raised with dry stones as was the method before cement came into use, are described as having been vitrisied, or the stones run and compacted together by the force of sire. Concerning the origin, use, &c. of these buildings, different opinions have been formed; and even the reality of them as works of contrivance has been called in question: of all which particulars the reader will find an account under the article Forms (Vitrisied).

But for whatever purpoles, or by whatever means, the above and other fimilar structures of a peculiar nature were erected, we have sufficient evidence that the people of Britain, before they were subdued and instructed by the Romans, had but a rude knowledge of architecture, and were very meanly lodged. As foon, however, as the Romans began to form fettlements and plant colonies in this island, a sudden and surprising change ensued in the state of architecture. For that wonderful people were as industrious as they were brave, and made hafte to adorn every country that they conquered. The first Roman colony was planted at Camelodunum, A. D. 50; and when it was destroyed by the Britons in their great revolt under Boadicea, only eleven years after, it appears to have been a large and well built town, adorned with statues, temples, theatres, and other public edifices.

The Romans not only built a prodigious number of folid, convenient, and magnificent structures for their Vol. II. Part I.

own accommodation, but they exhorted, encouraged, and instructed the Britons to imitate their example. This was one of the arts which Agricola, the most excellent of the Roman governors, employed to civilize the Britons, and reconcile them to the Roman govern-"The following winter (favs Tacitus) was spent by Agricola in very salutary measures. the Britons who led a roaming and unfettled life, and were easily instigated to war, might contract a love to peace and tranquillity, by being accustomed to a more pleafant way of living, he exhorted and affifted them to build houses, temples, courts, and marketplaces. By praising the diligent and reproaching the indolent, he excited so great an emulation among the Britons, that after they had erected all those necessary edifices in their towns, they proceeded to build others merely for ornament and pleasure, as porticoes, galleries, baths, banqueting houses, &c." From this time, which was A. D. 80. to the middle of the fourth century, architecture and all the arts immediately connected with it greatly flourished in this island; and the fame tafte for erecting folid, convenient, and beautiful buildings, which had long prevailed in Italy, was introduced into Britain. Every Roman colony and free city (of which there was a great number in this country) was a little Rome, encompassed with strong walls, adorned with temples, palaces, courts, halls, basilicks baths, markets, aqueducts, and many other fine buildings, both for use and ornament. The country everywhere abounded with well built villages, towns, forts, and stations; and the whole was defended by that high and strong wall, with its many towers and castles, which reached from the mouth of the river Tyne on the east to the Solway Frith on the west. This spirit of building, which was introduced and encouraged by the Romans, so much improved the taste and increased the number of the British builders, that in the third century this island was famous for the great number and excellence of its architects and artificers. When the emperor Constantius, father of Constantine the Great, rebuilt the city of Autun in Gaul, A. D. 206, he was chiefly furnished with workmen from Britain, "which (fays Eumenius) very much abounded with the best artificers."

Not very long after this period, architecture and all the arts connected with it began to decline very fensibly in Britain, and in all the provinces of the western empire. This was partly owing to the building of Constantinople, which drew many of the most famous architects and other artificers into the cast, and partly to the irruptions and depredations of the barbarous nations.

The final departure of the Romans was followed by the almost total destruction of architecture in this island. For the unhappy and unwarlike people whom they lest behind, having neither skill nor courage to defend the numerous towns, forts, and cities which they possessed, they were seized by their ferocious invaders, who sirst plundered and then destroyed them. By this means, the many noble structures, with which Provincial Britain had been adorned by the art and industry of the Romans, were ruined or desaced in a very little time; and the unfortunate Britons were quite incapable of repairing them, or of building others in their room. That long succession of miseries in which they were in-

volved by the Scots, Picts, and Saxons, deprived them of the many useful arts which, they had learned from their former masters, and lodged them once more in forests, dens, and caves, like their savage ancestors.

The most wanton and extensive devastations were those committed by the Anglo-Saxons; among whom it seems to have been a maxim to destroy all the towns and castles which they took from their enemies, instead

of preferving them for their own ule.

It cannot be supposed, that a people who wantonly demolished so many beautiful and useful structures had any take for the arts by which they had been erected. The truth is, that the Anglo-Saxons at their arrival in this island were almost totally ignorant of these arts; and, like all the other nations of Germany, had been accustomed to live in wretched hovels, built of wood or earth, and covered with straw or the branches of trees: nor did they much improve in the knowledge of architecture for 200 years after their arrival. During that period, malonry was quite unknown and unpractifed in this island; and the walls even of cathedral churches were built of wood. "There was a time (fays venerable Bede) when there was not a stone church in all the land; but the custom was to build them all of wood. Finan, the second bishop of Lindisfarne, or Holy Island, built a church in that island, A. D. 652, for a cathedral, which yet was not of flone, but of wood, and covered with reeds; and fo it continued till Eadbert, the fuccessor of St Cuthbert, and seventh bishop of Lundisfarne, took away the reeds. and covered it all over, both roof and walls, with sheets of lead." The first cathedral of York was built of the fame materials; and a church of thone was efteemed a kind of produgy in those times that merited a place in history. " Paulinus, the first bishop of York, built a church of flone in the city of Lincoln, whose walls (fays Bede) are full flanding, though the roof is fallen down; and fome healing miracles are wrought in it every year, for the benefit of those who have the faith to feck them."

There does not feem to have been so much as one church of stone, nor any artists who could build one, in all Scotland, at the beginning of the eighth century. For Naitan king of the Picts, in his famous letter to Coolined abbot of Weremouth, A. D. 710, earnestly entreats him to fend him some massons to build a church of stone in his kingdom, in imitation of the Romans; which he promises to dedicate to the honour of the apostle Peter, to whom the abbey of Weremouth was dedicated: and we are told by Bede, who was then living in that abbey, that the reverend abbot Ceolfred granted this pious request, and sent massons according to his desire.

Masonry was restored, and some other arts connected with it introduced into England, towards the end of the seventh century, by two clergymen, who were great travellers, and had often visited Rome, where they had acquired some taste for these arts. These were, the samous Wilfrid bishop of York, and afterwards of Hexham, and Benedict Biscop, sounder of the abbey of Weremouth. Wilfrid, who was one of the most ingenious, active, and magnificent prelates of the seventh century, was a great builder, and erected several structures at York, Rippon, and Hexham, which were the admiration of the age in which he

flourished. The cathedral of Hexham, which was one of these structures, is thus described by his biographer : Film Pita " Having obtained a piece of ground at Hexham from Wilfride, Queen Etheldreda, he there founded a most magnifi-c. 22. cent church, which he dedicated to the bleffed apostle St Andrew. As the plan of this facred structure iccins to have been inspired by the Spirit of God, it would require a genius much superior to mine to describe it properly. How large and strong were the subterra neous buildings, conftructed of the finest polished stones! How magnificent the superstructure, with its lofty roof, supported by many pillars, its long and high walls, its sublime towers, and winding stairs! In one word, there is no church on this fide of the Alps fo great and beautiful." This admired edifice, of which fome veftiges are still remaining, was built by masons and other artificers brought from Rome by the munificence of its generous founder. Benedict Biscop was the cotemporary and companion of Wilfrid in some of his journeys, and had the same taste for the arts. He made no fewer than fix journeys to Rome, chiefly with a view of collecting books, pictures, flatues, and other curiofities, and of perfuading artificers of various kinds to come from Italy and France and fettle in England. Having obtained a grant of a confiderable estate from Egfrid king of Northumberland, near the mouth of the river Were, he there founded a monaflery, A. D. 674. "About a year after the founda- Bede Hyltions of this monastery were laid, Benedict crossed the Albat. fea into France, where he collected a number of mafons, and brought them over with him, in order to build the church of his monastery of stone after the Roman manner, of which he was a great admirer. His love to the apostle Peter, to whom he designed to dedicate his church, made him urge these workmen to labour fo hard, that mass was celebrated in it about a year after it was founded. When the work was far advanced, he fent agents into France to procure if possible some glass-makers, a kind of artificers quite unknown in England, and to bring them over to glaze the windows of his church and monastery. These agents were fuccessful, and brought feveral glass-makers with them; who not only performed the work required by Benedict, but instructed the English in the art of making glass for windows, lamps, drinking vessels, and other

But though these arts of building edifices of stone, with windows of glass and other ornaments, were thus introduced by these two prelates in the latter part of the seventh century, they do not seem to have flourished much for several centuries. It appears from many incidental hints in our ancient historians, that stone buildings were still very rare in the eighth and ninth ages; and that when any fuch buildings were erected. they were the objects of much admiration. When Alfred the Great, towards the end of the ninth century, formed the defign of rebuilding his ruined cities, churches, and monasteries, and of adorning his dominions with more magnificent structures, he was obliged to bring many of his artificers from foreign countries. "Of these (as we are told by his friend and companion Afferius) he had an almost innumerable multitude, collected from different nations; many of them the most excellent in their several arts."

In the other parts of this island architecture was, as

Septentrionale, p.

166.

might naturally be imagined, in a still less flourishing flate. It appears indeed to have been almost entirely lost among the posterity of the ancient Britons after they retired to the mountains of Wales. The chief palace of the kings of Wales, where the nobility and wife men affembled for making laws, was called the white palace, because the walls of it were woven with white wands which had the bark peeled off. By the laws of Wales, whoever burnt or destroyed the king's hall or palace was obliged to pay one pound and eighty pence, befides one hundred and twenty pence for each of the adjacent buildings, which were eight in number; viz. the dormitory, the kitchen, the chapel, the granary, the bakehouse, the storehouse, the stable, and the doghouse. From hence it appears, that a royal residence in Wales, with all its offices, when these laws were made, was valued at five pounds and eighty pence of the money of that age, equal in quantity of filver to fixteen pounds of our money, and in efficacy to one hundred and fixty. This is certainly a sufficient proof of the meanness of those buildings which were only of wood. Even the castles in Wales, in this period, that were built for the fecurity of the country, appear to have been constructed of the same materials; for the laws required the king's vassals to come to the building of these castles with no other tools but an axe. The arts of building do not feem to have been much

better understood by the Scots and Picts than by the ancient Britons in the former part of this period. When Finan, the second bishop of Lindisfarne, built a church of wood in that island, A. D. 652, he is said to have done it more Scotorum, after the manner of his countrymen the Scots; and it hath been already obferved, that Naitan king of the Picts was obliged to bring masons from Northumberland, when he resolved to build a church of stone in his dominions, A. D. 710. After this last period, it is probable that the Picts, and perhaps the Scots, began to learn and practife the art of malonry; because there are still some stone buildings of a very fingular construction, and great antiquity, to be feen in Scotland. These buildings are all circular; though of two kinds fo different from each other, that they feem to be the work of different ages and of different nations. The largest of these structures are in a very extraordinary taste of architecture; and are thus described by a modern antiquary, who viewed them Gordon's I- with no little attention: " Having arrived at the barrack of Glenelg, I was conducted to the remains of those stapendous fabrics, seated about two miles from thence, in a valley called Glenbeg, in which four of them anciently flood. Two of these are now almost quite demolished, the third is half fallen down, the fourth is almost entire. The first I met with lies towards the north fide of the valley, and is called Caftle Chalamine, or Malcom's Castle. It stands upon a confiderable eminence, and affords us a fine prospect of the island of Sky and a good part of the sea coast. The foundation of this only appears; as also of that other, on the east end of the valley, called Castle Chonel. About a quarter of a mile further, upon the bank of a rivulet which passes through the middle of the glen, stands the third fabric called Cafile Tellve. I found it composed of slones without cement; not laid in regular courses, after the manner of elegant buildings, but rudely and without order. Those to-

they were thin and flat, some of them scarce exceeding the thickness of an ordinary brick. I was surprised to find no windows on the outlide, nor any manner of entrance into the fabric, except a hole towards the well, at the base, so very low and narrow, that I was forced to creep in upon hands and knees, and found that it carried me down four or five steps below the surface of the ground. When I was got within I was environed betwixt two walls, having a cavity or void space which led me round the whole building. Opposite to the little entry, on the outfide, was a pretty large door in the fecond or inner wall, which let me into the area or inner court. When I was there, I perceived that one half of the building was fallen down, and thereby had the opportunity of feeing a complete fection thereof. The two walls join together at the top, round about, and have formed a large void space or area in the middle. But to give a more complete idea of these buildings, I shall describe the fourth, called Cafile Troddan, which is by far the most entire of any in that country, and from whence I had a very clear notion how these fabrics were originally contrived. On the outlide were no windows, nor were the materials of this castle anywife different from those of the other already described, only the entry on the outside was fomewhat larger; but this might be occasioned by the falling of the stones from above. The area of this makes a complete circle; and there are four doors in the inner wall, which face the four cardinal points of the compass. These doors are each eight feet and a half high, and five feet wide, and lead from the area into the cavity between the two walls, which runs round the whole building. The perpendicular height of this fabric is exactly 33 feet; the thickness of both walls, including the cavity between, no more than 12 feet; and the cavity itself is hardly wide enough for two men to walk abreast; the external circumference is 178 feet. The whole height of the fabric is divided into four parts or stories, separated from each other by thin floorings of flat stones, which knit the two walls together, and run quite round the building; and there have been winding flairs of the fame flat flones afcending betwixt wall and wall up to the top. The undermost partition is fomewhat below the furface of the ground, and is the widest; the others grow narrower by degrees till the walls close at the top. Over each door are nine square windows, in a direct line above each other, for the admission of light; and between every row of windows are three others in the uppermost ftory, rifing above a cornice which projects out from the inner wall and runs round the fabric." From this description of these singular edifices, it plainly appears that they were defigned both for lodging and defence; and confidering the state of the times in which they were built, they were certainly very well contrived for answering both these purposes.

ward the base were pretty large, but ascending higher

The stone edifices of the other kind which were probably erected in this period, and of which some few are still to be seen in Scotland, are not so large as the former, but more artificial. They are slender, lofty, circular towers, of cut stone, laid in regular rows, between 40 and 50 feet in external circumference, and from 70 to 100 feet high, with one door some feet They are exactly fimilar to the from the ground.

Archaelo-

p. 307.

and therefore were probably built about the same time, which was in the tenth century, and for the same purposes; which are believed by some to have been for the confinement of penitents while they were performing penance. On this account these towers are always found in the neighbourhood of churches both in Scotland and Ireland; and are faid to have been used in this manner: "The penitents were placed in the uppergia, Vol. I. most story of the tower (which commonly consisted of five or fix ftories); where having made probation, or done penance, fuch a limited time, according to the heinousness of their crimes, they then were permitted to descend to the next floor, and so on by degrees, until they came to the door, which always faced the entrance of the church, where they flood to receive absolution from the clergy, and the bleflings of the people. A tedious process, to which few penitents in the present age would willingly submit. "Other writers are of opinion, that the defign of these circular towers (of which one is still remaining at Abernethy and another at Brechin) was to be places from whence the people were called to public worship by the found of a horn or trumpet, before the introduction

round tower of Ardmore, and several others, in Ireland;

This art received very great improvements in the 12th century; which indeed may be called the age of architecture; when the rage for building was more violent in England than at any other time. The great and general improvements that were made in the fabrics of houses and churches in the first years of this century, are thus described by a cotemporary writer. Oracrio Vi- " The new cathedrals and innumerable churches that were built in all parts, together with the many magnificent cloisters and monasteries, and other apartments of monks, that were then erected, afford a sufficient proof of the great felicity of England in the reign of Henry I. The religious of every order, enjoying peace and prosperity, displayed the most astonishing ardour in every thing that might increase the splendour of divine worship. The fervent zeal of the faithful prompted them to pull down houses and churches everywhere, and rebuild them in a better manner. By this means the ancient edifices that had been raifed in the days of Edgar, Edward, and other Christian kings, were demolished, and others of greater magnitude and magnificence, and of more elegant workmanship, were erected in their room, to the glory of God."

As the prodigious power of religious zeal, whatever turn it happens to take, when it is thoroughly heated, is well known, it may not be improper to give one example of the arts employed by the clergy and monks of this period, to inflame the pious ardour of the kings, nobles, and people, for building and adorning churches. When Joffred abbot of Croyland refolved to rebuild the church of his monastery in a most magnificent manner, A. D. 1106, he obtained from the archbishops of Canterbury and York, a bull dispenfing with the third part of all penances for fin to those who contributed any thing towards the building of that church. This bull was directed not only to the king and people of England, but to the kings of France and Scotland, and to all other kings, earls, barous, archbishops, bishops, abbots, priors, rectors, prefbyters, and clerks, and to all true believers in Christ,

rich and poor, in all Christian kingdoms. To make the best use of this bull, he sent two of his most eloquent monks to proclaim it over all France and Flanders, two other monks into Scotland, two into Denmark and Norway, two into Wales, Cornwal, and Ireland, and others into different parts of England. " By this means (fays the historian) the wonderful benefits granted to all the contributors to the building of this church were published to the very ends of the earth; and great heaps of treasure and masses of yellow metal slowed in from all countries upon the venerable Abbot Joffred, and encouraged him to lay the foundations of his church." Having spent about four years in collecting mountains of different kinds of marble from quarries both at home and abroad, together with great quantities of lime, iron, brafs, and other materials for building, he fixed a day for the great ceremony of laying the foundation, which he contrived to make a very effectual mean of raising the superstructure: For on the longexpected day, the feast of the Holy Virgins Felicitas and Perpetua, an immense multitude of earls, barons, and knights, with their ladies and families, of abbots, priors, monks, nuns, clerks, and persons of all ranks, arrived at Croyland, to affift at this ceremony. The pious Abbot Joffred began by faying certain prayers, and shedding a flood of tears on the foundation. Then each of the earls, barons, knights, with their ladies, fons, and daughters, the abbots, clerks, and others, laid a stone, and upon it deposited a sum of money, a grant of lands, tithes, or patronages, or a promife of Rone, lime, wood, labour, or carriages, for building After this the abbot entertained the the church. whole company, amounting to 5000 persons, at dinner. To this entertainment they were all entitled; for the money, and grants of different kinds, which they had deposited on the foundation stones, were alone sufficient to have raifed a very noble fabric. By such arts as these the clergy inspired kings, nobles, and people of all ranks, with fo ardent a spirit for these pious works, that in the course of this period almost all the facred editices in England were rebuilt, and many hundreds of new ones raised from the foundation. Nor was this spirit confined to England, but prevailed as much in Scotland in proportion to its extent and riches. King David I. alone, befides feveral cathedrals and other churches, built no fewer than thirteen abbeys and priories, some of which were very magnificent structures.

The facred architecture of the Anglo-Normans in the beginning of this period did not differ much in its Ryle and manner from that of the Anglo-Saxons; their churches being in general plain, low, strong, and dark; the arches both of the doors and windows femicircular, with few or no ornaments. By degrees, through much practice, our architects, who were all manks or clergymen, improved in their tafte and skill, and ventured to form plans of more noble, light, and elevated structures, with a great variety of ornaments; which led to that bold magnificent flyle of building, commonly, though perhaps not very properly, called the later Gothic. It is not improbable that our monkish architects were assisted in attaining this style of building by models, from foreign countries, or by instructions from such of their own number as had visited Italy, France, Spain, or the East. But the origin

tal. Hift.

Ecclef.

p. 788.

of this style of architecture has been already considered, and the characters by which it is diftinguished from the ancient Gothic have also been described: (Sec No 21. fupra.) Its first appearance in England was towards the latter end of the reign of King Henry II. But it was not at once thoroughly adopted; fome thort folid columns and femicircular arches being retained and mixed with the pointed oncs; as for example, in the west end of the Old Temple church; and at York, where under the choir there remains much of the ancient work, the arches of which are but jult pointed and rife on short round pillars. In the reign of Henry III. however, this manner of building feems to have gained a complete footing; the circular giving place to the pointed arch, and the maffive column yielding to the flender pillar. Indeed, like all novelties, when once admitted, the rage of fashion made it become fo prevalent, that many of the ancient and folid buildings, erected in former ages, were taken down in order to be re-edified in the new taste, or had additions patched to them, of this mode of architecture. The present cathedral church of Salisbury was begun early in this reign, and finished in the year 1258. It is entirely in the Saracenic style; and, according to Sir Christopher Wren, may be justly accounted one of the best patterns of architecture of the age in which it was built. Its excellency is undoubtedly in a great measure owing to its being constructed on one plan; whence arises that symmetry and agreement of parts, not to be met with in many of our other cathedral churches; which have mostly been built at different times, and in a variety of ftyles. From this time till the reign of Henry VIII. the fashionable pillars in churches were of Purbec marble, very flender and round, encompassed with marble shafts a little detached, having each a capital adorned with foliage, which joining, formed one elegant capital for the whole pillar. The windows were long and narrow, with pointed arches and painted glass, which was introduced about that time, or at least became more common. In this century also they began to delight in lofty steeples, with fpires and pinnacles. In the fourteenth century, the pillars confifted of an affemblage of shafts not detached, but united, forming one folid and elegant column: the windows, especially those in the east and west ends, were greatly enlarged, divided into feveral lights by stone mullions running into ramifications above, and forming numerous compartments in various fanciful Those windows, filled with stained glass of fliapes. the most lively colours, representing kings, faints, and martyrs, and their histories, made a most folemn and glorious appearance. There were feveral other variations, especially in the taste of the carvings and other ornaments, which are too minute for general history.

Astotheflate of civil architecture during thefame period: The houses of the common people in the country, and of the lower burgesses in towns and cities, were very little improved in their structure, that most numerous and useful order of men being much depressed in the times we are now delineating. Even in the capital city of London, all the houses of mechanics and common burgesses were built of wood, and covered with straw or reeds, toward the end of the twelsth century. But the palaces, or rather castles, of the Anglo-Norman kings, barons, and prelates, were very different from

the relidences of persons of the same rank in the Anglo-Saxon times. For this we have the testimony of a person of undoubted credit, who was well acquainted with them both. " The Anglo-Saxon nobles (fays William of Malmfbury) squandered away their ample revenues in low and mean houses; but the French and Norman barons are very different from them, living at less expence, but in great and magnificent palaces." The truth is, that the rage of building fortified caffles, was no less violent among the Norman princes, prelates, and barons, than that of building churches. To this they were prompted not only by the cultom of their native country, but also by their dangerous situation in this island. Surrounded by multitudes, whom they had depressed and plundered, and by whom they were abhorred, they could not think themselves safe without the protection of deep ditches and firong walls. The Conqueror himself was scusible, that the want of fortified places in England had greatly facilitated his conquest, and might facilitate his expulsion; and therefore he made all possible haste to remedy this defect, by building very magnificent and strong castles in all the towns within the royal demesnes. "William (says Matthew Paris) excelled all his predecessors in building castles, and greatly harasted his subjects and vastals with thefe works." All his earls, barons, and even prelates, imitated his example; and it was the first care of every one who received the grant of an estate from the crown, to build a castle upon it for his defence and residence. The disputes about the succession in the following reigns, kept up this spirit for building great and strong castles. William Rusus was still a greater builder than his father. "This William (fays Henry Knyghton) was much addicted to building royal castles and palaces, as the callles of Dover, Windfor, Norwich, Excter, the palace of Westminster, and many others, testify; nor was there any king of England before him that erected fo many and fuch noble edifices." Henry I. was also a great builder both of castles and monasteries. But this rage for building never prevailed so much in any period of the English history as in the turbulent reign of King Stephen, from A. D. 1135 to A. D. 1154. " In this reign (as we are told by the author of the Saxon Chronicle) every one who was able built a castle; so that the poor people were worn out with the toil of these buildings, and the whole kingdom was covered with castles." This last expression will hardly appear too strong, when we are informed, that besides all the castles before that time in England, no fewer than 1115 were raifed from the foundation in the short space of 19 years. See the article CASTLE.

The cattles, monasteries, and greater churches of this period, were generally covered with lead, the windows glazed; and when the walls were not of ashler, they were neatly plastered, and whitewashed onboth sides. The doors, sloors and roof, were commonly made of oak planks and beams, exactly smoothed and jointed, and frequently carved. It is hardly necessary to observe, that the building one of these great and magnificent eastles, monasteries, or churches, of which there were many in England, must have been a work of prodigious expence and labour; and that the architects and artificers, by whom that work was planned and executed, must have attained considerable dexterity

rated with Ionic pillars. These verses of Spenser,

History.

On stately pillars, fram'd after the Doric guise.

bear an allusion to some of the fashionable improvements in building, which at this time were growing more and more into esteem. Thus also Bushop Hall, who wrote about the same time, viz. 1598:

There findest thou some stately Doricke frame, Or neat Ionicke work.

But these ornaments were often absurdly introduced into the old Gothic style: as in the magnificent portico of the schools at Oxford, erected about the year 1613; where the builder, in a Gothic edifice, has affeetedly displayed his universal skill in the modern architecture, by giving us all the five orders together. However, most of the great buildings of Queen Elizabeth's reign have a ftyle peculiar to themselves both in form and finishing; where, though much of the old Gothic is retained, and great part of the new tafte is adopted, yet neither predominates; while both, thus distinctly blended, compose a fantastic species, hardly reducible to any class or name. One of its characteriftics is the affectation of large and lofty windows: where, fays Bacon, " you shall have sometimes fair houses so full of glass, that one cannot tell where to come to be out of the fun."

To return now to our general history, and to conclude: In the 15th and 16th centuries, when learning of all kinds began to revive, the chafte architecture of the Greeks and Romans seemed as it were to be recalled into life. The first improvements in it began in Italy, and owed their existence to the many ruins of the ancient Roman structures that were to be found in that country, from whence an improved method of building was gradually brought into the other countries of Europe: and though the Italians for a long time retained the superiority as architects over the other European nations; yet, as men of genius travelled from all quarters into Italy, where they had an opportunity of seeing the originals from whence the Italians copied, architects have arisen in other nations equal, if not superior, to any that ever appeared in Italy. Of this we have a recent inflance in our own countryman Mr Mylne, who lately gained the prize in architecture at Rome, where it would no doubt be disputed by fuch natives of Italy as were best skilled in that art.

dexterity in their respective arts. Several of these architects have obtained a place in history, and are highly celebrated for their superior skill. William of Sens, architect to Archbishop Lanfranc in building his eathedral, is faid, by Gervase of Canterbury, to have been a most exquisite artist both in stone and wood. He made not only a model of the whole cathedral, but of every particular piece of sculpture and carving, for the direction of the workmen; and invented many curious machines for loading and unloading ships, and conveying heavy weights by land, because all the stones were brought from Normandy. Matthew Paris speaks even in a higher strain of Walter of Coventry, who flourished towards the end of this period, when he fays, that " fo excellent an architect had never yet appeared, and probably never would appear, in the world." This encomium was undoubtedly too high; but it is impoffible to view the remains of many magnificent fabrics, both facred and civil, that were erected in this period, without admiring the genius of the architects by whom they were planned, and the dexterity of the workmen by whom they were executed.

In the beginning of the reign of Henry VIII. or rather towards the latter end of that of Henry VIII. when brick building became common, a new kind of low pointed arch grew much in use: it was described from four centers, was very round at the baunches, and the angle at the top was very obtuse. This fort of arch is to be found in every one of Cardinal Wolsey's buildings; also at West Sheen; an ancient brick gate at Mile End, called King John's Gate; and in the great gate of the palace of Lambeth. From this time Gothic architecture began to decline; and was soon after tupplanted by a mixed style, if one may venture to call it one; wherein the Grecian and Gothic, however discordant and irreconcilable, are jumbled together. Concerning this mode of building, Mr Warton, in his observations on Spenser's Faery Queene, has the follow-

ing anecdotes and remarks:

"Altho' the Roman or Grecian architecture did not begin to prevail in England till the time of Inigo Jones, yet our communication with the Italians, and our imitation of their manners, produced fome specimens of that style much earlier. Perhaps the earliest was Somerset House in the Strand, built about the year 1549, by the duke of Somerset, uncle to Edward VI. The monument of Bishop Gardiner, in Winchester cathedral, made in the reign of Mary, about 1555, is deco-

PART I. PRINCIPLES OF ARCHITECTURE.

MANY ages must have elapsed before architecture came to be considered as a fine art. Utility was its original destination, and still continues to be its principal end. Experience, however, has taught us, that architecture is capable of exciting a variety of agreeable feelings. Of these, utility, grandeur, regularity, order, and proportion, are the chief.

Distinction of build- ings

Architecture, being an useful as well as a fine art, leads us to distinguish buildings, and parts of buildings, into three kinds, viz. what are intended for use folely, what for ornament folely, and what for both. Buildings intended for utility folely, ought in every part to correspond precisely to that intention: the least devia-

tion from use, though contributing to ornament, will be disagreeable; for every work of use being considered as a mean to an end, its perfection as a mean is the capital circumstance, and every other beauty in opposition is neglected as improper. On the other hand, in such things as are intended solely for ornament, as columns, obelisks, triumphal arches, &c. beauty alone ought to be regarded. The principal difficulty in architecture lies in combining use and ornament. In order to accomplish these ends, different and even opposite means must be employed; which is the reason why they are so seldom united in perfection; and hence, in buildings of this kind, the only practicable method is,

R C HI U R E.

Principles to prefer utility to ornament according to the character of the building: in palaces, and fuch buildings as admit of a variety of useful contrivance, regularity ought to be preferred; but in dwelling houses that are too small for variety of contrivance, utility ought to prevail, neglecting regularity as far as it stands in opposition to convenience.

Intrinfic and rela-

In confidering attentively the beauty of vifible objects, we discover two kinds. The first may be termed tive beauty, intrinsic beauty, because it is discovered in a single object, without relation to any other. The fecond may be termed relative beauty, being founded on a combination of relative objects. Architecture admits of both kinds. We shall first give a few examples of relative beauty.

> The proportions of a door are determined by the use to which it is deftined. The door of a dwelling house, which ought to correspond to the human fize, is confined to seven or eight feet in height and three or four in breadth. The proportions proper for a stable or coachhouse are different. The door of a church ought to be wide, in order to afford an easy passage for a multitude; and its height must be regulated by its wideness, that the proportion may please the eye. The fize of the windows ought always to be proportioned to that of the room they are destined to illuminate: for if the apertures be not large enough to convey light to every corner, the room must be unequally lighted, which is a great deformity. Steps of stairs should likewife be accommodated to the human figure, without regarding any other proportion; they are accordingly the same in large and in small buildings, because both are inhabited by men of the same fize.

> We shall next consider intrinsic beauty, blended with that which is relative. A cube itself is more agreeable than a parallelopipedon; this constantly holds in small figures: but a large building in the form of a cube is lumpish and heavy; while a parallelopipedon, set on its fmaller base, is more agreeable on account of its elevation: Hence the beauty of Gothic towers. But if this figure were to be used in a dwelling house, to make way for relative beauty, we would immediately perceive that utility ought chiefly to be regarded; and this figure, inconvenient by its height, ought to be fet on its larger base: the loftiness in this case would be lost; but that loss will be more than sufficiently compenfated by the additional convenience. Hence the form of buildings forcad more upon the ground than raifed in height, is always preferred for a dwelling

25 Internal

With regard to the internal divisions, utility redivisions of quires that the rooms be rectangular, to avoid useless spaces. An hexagonal figure leaves no void spaces; but it determines the rooms to be all of one fize, which is both inconvenient and difagreeable for want of varity. Though a cube be the most agreeable figure, and may answer for a room of a moderate size; yet, in a very large room, utility requires a different figure. Unconfined motion is the chief convenience of a great room; to obtain this the greatest length that can be had is necessary. But a square room of large fize is inconvenient. It removes chairs, tables, &c. at too great a distance from the hand, which, when unemployed, must be ranged along the sides of the room. Utility, therefore, requires a large room to be a parallelogram. This figure is likewise best calculated for Principles. the admission of light; because, to avoid cross lights, all the windows ought to be in one wall; and if the opposite wall be at such a distance as not to be fully lighted, the room must be obscure. The height of a room exceeding nine or ten feet has little relation to utility; therefore proportion is the only rule for determining the height when above that number of feet.

Artists who deal in the beautiful, love to entertain Utility and the eye; palaces and fumptuous buildings, in which in-beauty oftrinsic beauty may be fully displayed, give them an op-ten incomportunity of exerting their tafte. But such a propen-patible. fity is peculiarly unhappy with regard to private dwelling houses; because, in these, relative beauty cannot be displayed to perfection without hurting intrinsic beauty. There is no opportunity for great variety of form in a small house; and in editices of this kind, internal convenience has not hitherto been happily adjusted to external regularity. Perhaps an accurate coincidence in this respect is beyond the reach of art. Architects. however, constantly split upon this rock; for they never can be perfuaded to give over attempting to reconcile these two incompatibles: how otherwise should it happen, that of the endless variety of private dwelling houses, there should not be one found that is generally agreed upon as a good pattern? the unwearied propenfity to make a house regular as well as convenient obliges the architect, in some articles, to facrifice convenience to regularity; and, in others, regularity to convenience; and accordingly the house which turns out neither regular nor convenient, never fails to difplease.

Nothing can be more evident, than that the form of a dwelling house ought to be suited to the climate; yet no error is more common than to copy in Britain the form of Italian houses, not forgetting even those parts that are purpofely contrived for collecting air, and for excluding the fun; witness our colonnades and logios, defigned by the Italians to gather cool air, and exclude the beams of the fun, conveniences which the climate of this country does not require.

We shall next view architecture as one of the fine Architecarts; which will lead us to the examination of fuch ture confibuildings, and parts of buildings, as are calculated fole-dered as a ly to please the eye. Variety prevails in the works of fine art. nature; but art requires to be guided by rule and compass. Hence it is, that in such works of art as imitate nature, the great art is, to hide every appearance of art; which is done by avoiding regularity and indulging variety. But in works of art that are original and not imitative, fuch as architecture, itrict regularity and uniformity ought to be fludied, fo far as confiltent with utility.

Proportion is not less agreeable than regularity and Difference uniformity; and therefore, in buildings intended to between please the eye, they are all equally effectial. It is taken proporfor granted by many writers, that in all the parts tions of of a building there are certain strict proportions which and quanpleafe the eye, in the fame manner as in found there tity. are certain thrich proportions which please the ear; and that, in both, the flightest deviation is equally disagreeable. Others feem to relish more a comparison between proportion in numbers and proportion in quantity; and maintain, that the same proportions are agreeable in both. The proportions, for example, of the num-

riples hers 16, 24, and 36, are agreeable; and lo, fay they, are the proportions of a room, whose height is 16 feet, the breadth 24, and the length 36. But it ought to be considered, that there is no resemblance or relation between the objects of different senses. What pleases the ear in harmony, is not the proportion of the strings of the instrument, but of the found which these firings produce. In architecture, on the contrary, it is the proportion of different quantities that pleases the eye, without the least relation to found. The same thing may be faid of numbers. Quantity is a real quality of every body; number is not a real quality, but merely an idea that arises upon viewing a plurality of things in succesfion. An arithmetical proportion is agreeable in numbers; but have we from this any reason to conclude, that it must also be agreeable in quantity? At this rate, a geometrical proportion, and many others, ought also to be agreeable in both. A certain proportion may coincide in quantity and number; and amongst an endless variety of proportions, it would be wonderful if there never should be a coincidence. One example is given of this coincidence in the numbers 16, 24, and 36; but, to be convinced that it is merely accidental. we need but reflect, that the same proportions are not applicable to the external figure of a house, and far less to a column.

It is ludicrous to observe writers acknowledging the necessity of accurate proportions, and yet differing widely about them. Laying aside reasoning and philosophy, one fact univerfally agreed on ought to have undeceived them, that the same proportions which please in a model are not agreeable in a large building : a room 48 feet in length, and 24 in breadth and height, is well proportioned: but a room 12 feet wide and high, and 24 long. approaches to a gallery.

Beauty ari-Perrault, in his comparison of the ancients and mofing from derns, goes to the opposite extreme; maintaining, that proportion the different proportions assigned to each order of columns are arbitrary, and that the beauty of these proportions is entirely the effect of custom. But he should have confidered, that if these proportions had not originally been agreeable, they could never have been

established by custom.

For illustrating this point, we shall add a few examples of the agreeablenels of different proportions. In a fumptuous edifice, the capital rooms ought to be large, otherwise they will not be proportioned to the fize of the building; for the fame reason, a very large room is improper in a small house. But in things thus related, the mind requires not a precise or single proportion, rejecting all others; on the contrary, many different proportions are equally agreeable. It is only when a proportion becomes loose and distant, that the agreeableness abutes, and at last vanishes. Accordingly, in buildings, rooms of different proportions are found to be equally agreeable, even where the proportion is not influenced by utility. With regard to the proportion the height of a room should bear to the length and breadth, it must be extremely arbitrary, considering the uncertainty of the eye as to the height of a room when it exceeds 16 or 17 feet. In columns, again, every architect must confess that the proportion of height and thickness varies betwirt 8 diameters and 10, and that every proportion between these two extremes is agreeable. Besides, there must certainly be a further

variation of proportion, depending on the fize of the Principles. column. A row of columns 10 feet high, and a row twice that height, require different proportions: The intercolumniations must also differ in proportion ac-

cording to the height of the row.

Proportion of parts is not only itself a beauty, but is inseparably connected with a beauty of the highest relish, that of concord and harmony; which will be plain from what follows: A room, the parts of which are all finely adjusted to each other, strikes us not only with the beauty of proportion, but with a pleasure far superior. The length, the breadth, the height, the windows, raife each of them a separate emotion: These emotions are similar; and, though faint when separately felt, they produce in conjunction the emotion of concord or harmony, which is very pleasant. On the other hand, where the length of a room far exceeds the breadth, the mind, comparing together parts fo intimately connected, immediately perceives a disagreement or dis-proportion which disgusts. Hence a long gallery, however convenient for exercise, is not an agrecable figure of a room.

In buildings destined chiefly or folely to please the eye, regularity and proportion are effentially necessary, because they are the means of producing intrinsic beauty. But a skilful artist will not confine his view to re- form of gularity and proportion; he will also study congruity, to be fustwhich is perceived when the form and ornaments of a ed to the structure are suited to the purpose for which it is ap-purposes pointed. Hence every building ought to have an ex-for which pression suited to its destination. A palace ought to they are be fumptuous and grand; a private dwelling, neat and intended modest; a playhouse, gay and splendid; and a monument, gloomy and melancholy. A heathen temple has a double destination: It is considered as a house dedicated to some divinity; therefore it ought to be grand, elevated, and magnificent: It is also confidered as a place of worship; and therefore ought to be somewhat dark and gloomy, because dimness or obscurity produces that tone of mind which is favourable to humility and devotion. Columns, besides their chief destination of being supports, contribute to that peculiar expression which the destination of a building requires. Columns of different proportions serve to express loftinels, lightnels, &c. as well as strength. Situation may also contribute to expression: Conveniency regulates the fituation of a private dwelling-house; and the fituation of a palace ought to be lofty. This leads to a question, Whether the situation, where there happens to be no choice, ought, in any measure, to regulate the form of the edifice? The connexion between a great house and a neighbouring field, though not extremely intimate, demands, however, fome congruity. It would, for example, displease us to find an elegant building thrown away upon a wild uncultivated country: congruity requires a polished field for such a building. The old Gothic form of building was well fuited to the rough uncultivated regions where it was invented; but was very ill adapted to the fine plains of France and Italy.

The external firucture of a house leads naturally to Internal its internal structure. A large and spacious room, division of which is the first that commonly receives us, is a bad houses. contrivance in feveral respects. In the first place, when immediately from the open air we step into such

$\mathbf{H} \cdot \mathbf{I}$ T Ē R

Principles a room, its fize in appearance is diminished by contraft; it looks little, compared with the great canopy of the sky. In the next place, when it recovers its grandeur, as it foon doth, it gives a diminutive appearance to the rest of the house; passing from it, every apartment looks little. In the third place, by its fituation it ferves only for a waiting room, and a passage to the principal apartments. Rejecting therefore this form, a hint may be taken from the climax in writing for another that appears more suitable: A handsome portico, proportioned to the fize and fashion of the front, leads into a waiting room of a larger fize, and this to the great room, all by a progression of fmall to great.

Grandeur is the principal emotion that architecture Is capable of raising in the mind: it might therefore be the chief study of the artist, in great buildings deflined to please the eye. But as grandeur depends partly on fize, it is unlucky for architecture that it is governed by regularity and proportion, which never deceive the eye by making objects appear larger than they are in reality. But though regularity and proportion contribute nothing to grandeur, fo far as that emotion depends on fize; yet they contribute greatly to it by confining the fize within such bounds that it can be taken in and examined at one view; for when objects are so large as not to be comprehended but in parts, they tend rather to diftract than satisfy the

We shall next pass to such ornaments as contribute to give buildings a peculiar expression. It has been doubted, whether a building can regularly admit any ornament but what is useful, or at least has that appearance. But, confidering the double aim of architecture as a fine, as well as an ufeful ait, there is no reason why ornaments may not be added to please the eye, without any relation to utility. A private dwelling house, it is true, and other edifices, where use is the chief aim, admit not regularly any ornament but what has at least the appearance of use; but temples, triumphal arches, and other buildings, intended chiefly or folely for flow, may be highly ornamented.

Different

This fuggetts a division of ornaments into three kinds of or-kinds, viz. 1. Ornaments that are beautiful without relation to use; such as statues, vases, basso or alto relievo: 2. Things in themselves not beautiful, but posfessing the beauty of utility, by imposing on the spectator, and appearing to be useful; such as blind windows: 3. Where things are beautiful in themselves, and at the same time take on the appearance of use;

fuch as pilasters.

With regard to the first, we naturally require that a statue be so placed, as to be seen in every direction, and examined at different distances. Statues, therefore, are properly introduced to adorn the great flair that leads to the principal door of a palace, or to leffen the void between pillars. But a niche in the external front is an improper place for a statue. There is an additional reason against placing them upon the roof or top of the walls: their ticklish situation gives pain, as they have the appearance of being in danger of tumbling down; besides, we are included to feel - from their being too much exposed to the inclemencies of the weather. To adorn the top of the wall Vol. II. Part L.

with a row of vales, is an unhappy conceit, by pla- Principly cing a thing, whose natural defination is utility, where it cannot have even the appearance of use. As to carvings upon the external furface of a building, termed baffo relievo when flat, and alto relievo when prominent, all contradictory expressions ought to be avoided. Now, firmness and folidity being the proper expressions of a pedestal, and, on the contrary, lightness and delicacy of carved work, the pedestal, whether of a column or of a statue, ought to be sparingly ornamented. The ancients never ventured any bolder ornament than the basso relievo.

With respect to ornaments of the fecond kind, it is a great blunder to contrive them so as to make them appear uscless. A blind window, therefore, when neceffary for regularity, ought to be so disguised as to appear a real window: when it appears without difguife, it is difgustful, as a vain attempt to supply the want of invention; it shows the irregularity in a stronger light, by fignifying that a window ought to be there in point of regularity, but that the architect had not skill sufficient to connect external regularity with internal convenience.

As to the third, it is an error to fink pilasters so far into the wall, as to remove totally, or mostly, the appearance of use. They should always project so much from the wall, as to have the appearance of supporting the entablature over them.

From ornaments in general, we defeend to a pillar, Columns. the chief ornament in great buildings. The destination of a pillar is to support, really, or in appearance, another part, termed the entablature. With regard to the form of a pillar, it must be observed, that a circle is a more agreeable figure than a fquare, a globe than a cube, and a cylinder than a parallelopipedon. This last, in the language of architecture, is faying, that a column is a more agreeable figure than a pilafter; and for that reason it ought to be preferred, when all other circumstances are equal. Another reason concurs, that a column annexed to a wall, which is a plain furface, makes a greater variety than a pilafter. Befides, pilasters at a distance are apt to be mistaken for pillars; and the spectator is disappointed, when, on a nearer approach, he discovers them to be only pilasters.

As to the parts of a column, a base uniform cylinder, without a capital, appears naked; and without a base, appears too ticklishly placed to stand firm; it ought therefore to have some finishing at the top and bottom: Hence the three chief parts of a column, the shaft, the base, and the capital. Nature undoubtedly requires proportion among these parts, but it admits of variety of proportion. Vitruvius and some of the elder writers feem to think, that the proportions of columns were derived from the human figure, the capital reprefenting the head, the base the feet, and the shaft the body. The Tuscan has been accordingly denominated the Gigantie; the Doric, the Herculean; the Ionic, the Matronal; and the Corinthiau, the Firginal;—The Composite is a mixture of the Corinthian and Ionic. As to the base, the principle of utility interpofes to vary it from the human figure, and to proportion it fo to the whole, as to give the column the appearance of ilability.

Among the Greeks, we find only three orders of Whether columns, the Dorie, the lonic, and the Corinthian, di-can be in-

flinguished versed.

general.

inciples stinguished from each other by their destination as well as by their ornaments. It has been disputed, whether any new order can be added to these: some hold the affirmative, and give for instances the Tuscan and Composite: others maintain, that these properly are not distinct orders, but only the original orders, with some flight variation. The only circumstances that can ferve to distinguish one order from another, are the form of the column, and its destination. To make the first z distinguishing mark, without regard to the other, would multiply orders without end. Destination is more limited, and it leads us to distinguish three kinds of orders; one plain and strong, for the purpose of supporting plain and massy buildings; one delicate and graceful, for supporting buildings of that character; and between these, a third, for supporting buildings of a mixed nature. So that, if destination alone is to be regarded, the Tuscan is of the same order with the Doric, and the Composite with the Corin-

The ornaments of these three orders ought to be fuited to the purpoles for which they are intended. Plain and rustic ornaments would not be a little difcordant with the elegance of the Corinthian order, and fweet and delicate ornaments not less with the strength of the Doric.

With respect to buildings of every kind, one rule, dictated by utility, is, that they be firm and flable. building in Another, dictated by beauty, is, that they also appear fo to the eye: for every thing that appears tottering, and in hazard of tumbling down, produceth in the spectator the painful emotion of fear, instead of the pleating emotion of beauty; and accordingly it should be the great care of the artist, that every part of his edifice appear to be well supported. Some have introduced a kind of conceit in architecture, by giving parts of buildings the appearance of falling; of this kind is the church of St Sophia in Conftantinople; the round towers in the uppermost stories of Gothic buildings is in the same falle taile.

> The most considerable ornaments used in architecture are five orders of columns, pediments, arches, ballufters, &c. of which in the following chapters.

CHAP. I. Of the Orders of Architecture.

An order confifts of two principal members, the COLUMN and the ENTABLATURE; each of which is composed of three principal parts. Those of the columns are, the Bafe, the Shaft, and the Capital; and those of the Entablature are, the Architrave, the Frize and the Cornice. All these are subdivided into many leffer parts, whose number, form, and dimenfions, characterize each order, and express the degree of strength, delicacy, richess, or simplicity peculiar

36 The parts that compose an order may be distributed Parts of an order divid- into two different classes. In the first may be ranged ed into two all that have any analogy to the primitive huts, and represent some part that was necessary in their constructure. Such are the shaft of the column, with the touth of its base, and the abacus of its capital; likewife the architrave and triglyphs, the mutules, modilions, or dentiles, which all of them reprefent the rafters, or some other pieces of timber used to sup-

port the covering; and the corona, representing the Principles. beds of materials that composed the covering. All these may properly be distinguished by the name of essential members. The subservient parts, contrived for the use or ornaments of the former, and commonly called mouldings, may conflitute the fecond class.

There are eight regular mouldings in ornamenting columns: the fillet, liftel, or fquare; the aftragal, or bead; the torus, or tore; the scotia, mouth, or casement; the echinus, ovolo, or quarter-round; the inverted cyma, talon, or ogee; the cyma, cyma recta, or cymation; the cavetto, or hollow. The names of these allude to their forms, and their forms are adapted to the purpofes for which they are intended. See Plate XXXVIII.

The ovolo and talon, as they are strong at the extremities, are fit for supports; the cyma and cavetto, though improper for supports, serve for coverings to shelter other members; the torus and aftragal, being shaped like ropes, are intended to bind and fortify the parts with which they are connected: But the use of the scotia and fillet is only to separate and distinguish the other mouldings, to give a graceful turn to the profile, and to prevent the confusion which would arise from joining feveral curved members together.

There are various methods of describing the contours of mouldings; but the simplest and best is to form them of quadrants of circles.

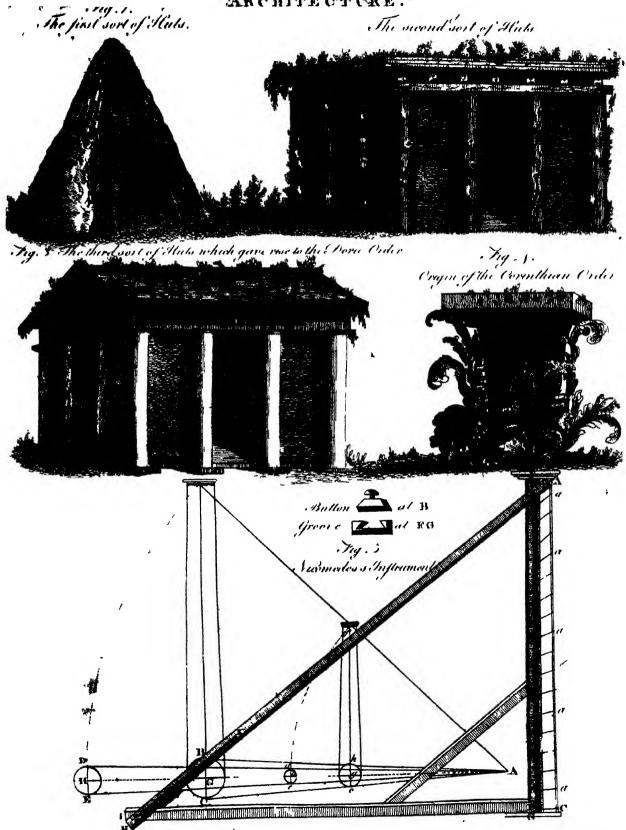

An affemblage of what are called effectial parts and Profile. mouldings is termed a profile. The most perfect pro-what. files are fuch as are composed of few mouldings, varied in form and fize; and fo disposed, that the straight and curved ones fucceed each other alternately. When ornaments are employed in mouldings, some of them should be left plain, in order to give a proper repose : For when all are ornamented, the figure of the profile is loft.

Columns, in imitation of trees, from which they Diminudrew their origin, are tapered in their shafts. In the tion of coautiques the diminution is variously performed: begin-lumns. ing sometimes from the foot of the shaft, and at others from one quarter, or one-third of its height; the lower part being perfectly cylindrical. The former of these was most in use amongst the ancients, and being the most natural and graceful, ought to have the preference, though the latter hath been more univerfally practifed by modern artifls.

The first architects, says M. Auzoult, probably made their columns in straight lines, in imitation of trees; fo that their shaft was a frustum of a cone: but finding this form abrupt and difagreeable, they made use of some curve, which, springing from the extremities of the superior and inferior diameters of the column, swelled beyond the sides of the cone, and by that means gave a more pleasing figure to the

Vitruvius, in the second chapter of his third book, mentions this practice, but in so obscure and cursory a manner, that his meaning hath not been understood; and feveral of the modern architects, intending to conform themselves to his doctrine, have made the diameters of their columns greater in the middle than at the foot of the shaft. Leon Baptista, Alberti, and others of the Florentine and Roman architects, have carried this to a very great excess; for which they

MANAGORIA DE COMPOSICIO :

. IBells Prin Hal Berilplas

Principles have been juftly blamed, as it is neither natural, rea-

Monsieur Auzoult observes, that a column, supposing its shafts to be the frustum of a tone, may have an additional thickness in the middle, without being swelled there beyond the bulk of its inferior parts; and supposes the addition mentioned by Vitruvius to signify nothing but the increase towards the middle of the column, occasioned by changing the straight line, which at first was in use, for a

This supposition is extremely just, and sounded on what is observed in the works of antiquity; where there is no instance of columns thicker in the middle than at the bottom, though all have the swelling hinted at by Vittuvius, all of them being terminated by curves; some granite columns excepted, which are bounded by straight lines; a proof, perhaps, of their antiquity, or of their having been wrought in the quarries of Egypt by bungling and unskilful work-

Monsieur Blondel, in his book entitled Refolution des quatre principaux problemes d'Architetture, teaches various manners of diminishing columns; the best and simplest of which is by means of the instrument which Nicomedes invented to describe the first conchoid: for this, being applied at the bottom of the shaft, performs at one sweep both the swelling and the diminution; giving such a graceful form to the column, that it is universally allowed to be the most perfect practice hitherto discovered. The columns in the Pantheon, accounted the most beautiful among the antiques, are made in this manner; as appears by the exact measures of one of them to be found in Desgodet's antiquities of Rome.

To give an accurate idea of the operation, it will

Vignola's method.

be necessary first to describe Vignola's method of di-minution, on which it is grounded. "As to this fecond method, fays Vignola, it is a discovery of my own; and although it be less known than the former, it will be easily comprehended by the figure. Having therefore determined the measures of your column, (that is to fay, the height of the shaft, and PLXXXIVits inferior and fuperior diameters), draw a line indefinitely from C through D, perpendicular to the axis of the column: this done, fet off the distance C D, which is the inferior semi-diameter, from A, the extreme point of the fuperior femi-diameter, to B, a point in the axis; then from A, through B, draw the line A B E, which will cut the indefinite line C D in E; and, from this point of interfection E, draw through the axis of the column any number of rays as E b a, on each of which, from the axis towards the circumference, fetting off the interval CD, you may find any number of points, a, a, a, through which if a curve be drawn, it will describe the swelling and diminution of the column."

40 N'comedes's instrument.

Though this method be sufficiently accurate for practice, especially if a considerable number of points be found, yet strictly speaking, it is defective; as the curve must either be drawn by hand, or by applying a flexible ruler to all the points; both of which are liable to variations. Blondel therefore, to obviate this objection, (after having proved the curve passing from

A to C through the points a, a, to be of the fame na-Principles. ture with the first conchoid of the ancients), employed the instrument of Nicomedes to describe it; the construction of which is as follows:

Having determined, as above, the length of the shaft, with the inferior and superior diameters of the column, and having likewise found the length of the line C D E, take three rulers, either of wood or metal, as FG, ID, and AH; of which let FG and ID be fastened together at right angles in G. Cut a dove-tail groove in the middle of FG, from top to bottom; and at the point E on the ruler I D (whose distance, from the middle of the groove in F G, is the fame as that of the point of interfection from the axis of the column) fix a pin; then on the ruler A H fet off the distance A B, equal to C D the inferior femidiameter of the column, and at the point B fix a button, whose head must be exactly sitted to the groove made in F G, in which it is to flide; and, at the other extrem'y of the ruler A H, cut a flit or canal from H to K, whose length must not be less than the difference of length between E B and E D, and whose breadth must be sufficient to admit the pin fixed at E. which must pass through the slit, that the rules may flide thereon.

The inflrument being thus completed, if the middle of the groove, in the ruler F G, be placed exactly over the axis of the column, it is evident that the ruler A H, in moving along the groove, will with the extremity A describe the curve A a a C; which curve is the same as that produced by Vignola's method of diminution, supposing it done with the utmost accuracy; for the interval A B, a b, is always the same; and the point E is the origin of an infinity of lines, of which the parts B A, ba, ba, extending from the axis to the circumference, are equal to each other and to D C. And if the rulers be of an indefinite fize, and the pins at E and B be made to move along their respective rulers, so that the intervals A B and DE may be augmented or diminished at pleasure, it is likewise evident that the same instrument may be thus applied to columns of any fize.

In the remains of antiquity the quantity of the di-Quantity of minution is various; but feldom lefs than one eighth diminution, of the inferior diameter of the column, nor more than one fixth of it. The last of these is by Vitruvius efteened the most perfect?

Of the Tuscan Order.

This is the most solid and simple of all the orders. PLXXXV. It is composed of sew parts, devoid of ornaments, and so massly, that it seems capable of supporting the heaviest burden. There are no remains of a regular Tuscan order among the antiques: the doctrine of Vitruvius concerning it is obscure; and the profiles of Palladio, Scamozzi, Serlio, de l'Orme and Vignola, are all impersect.

The height of the Tuscan column is 14 modules, or femi-diameters, each confishing of 30 minutes; and that of the whole entablature 3 includes; which being divided into 10 equal parts, three of them are for the height of the architrave, three for the frize, and the remaining four for the cornice. The capital is one module; the base, including the lower cincture of

Gg2

Principles the shaft is likewise one module; and the shaft, with its upper cincture and aftragal, 12 modules.

These are the general dimensions of the order; the particular dimensions may be learned by inspection of

the plates.

In the remains of antiquity, the quantity of diminution at the top of the Tuscan column is various; but feldom less than one-eighth, nor more than onefixth, of the inferior diameter of the column. The last of these is generally preferred; and Chalmers and others make the same diminution in all columns, without regard to their order.

Of the Doric Order.

XXXVI.

This order is next in strength to the Tuscan; and being of a grave, robust, and masculine aspect, is by Scamozzi called the Herculean. As it is the most ancient of all the orders, it retains more of the structure of the primitive huts than any of the rest; the triglyphs in its frize reprefenting the ends of the joilts, and the mutules in its cornice reprefenting the rafters.

The height of the Doric column, including its capital and base, is 16 modules, and the height of the entablature four; the latter of which being divided into eight parts, two of them are for the architrave, three for the frize, and three for the cornice.

In most of the antiques, the Doric column is executed without a base. Vitruvius likewise makes it without one; the base, according to him, having been first employed in the Ionic order, in imitation of the fandal o: a woman's foot. Scamozzi blames this practice, and most of the modern architects are of his epinion.

or the frize

In the profile of the theatre of Marcellus, the Ornaments frize is enriched with husks and roses; the architrave consists only of one fascia and a fillet; the drops are conical; the metope is enriched with a bull's skull, adorned with a garland of beads, in imitation of those on the temple of Jupiter Tonans, at the foot of the Capitol. In some antique fragments, and in a great many modern buildings, the metopes are alternately adorned with ox skulls and pateras. But they may be filled with any other ornaments, according to the deflination of the building.

The Ionic Order

Plate

Is of a more flender make than the Doric or Tufcan; its appearance is simple, yet graceful and majestic; its ornaments are few: so that it has been compared to a fedate matron, in decent, rather than magnificent attirc.

Among the ancients, the form of the Ionic profile appears to have been more positively determined than that of any other order; for in all the antiques at Rome (the temple of Concord excepted), it is exactly the same.

The modern artists have likewise been unanimous in their opinions; all of them, excepting Palladio and his imitators, having employed the dentil, cornice, and the other parts of the profile, nearly as they are found in the Colifeum, the temple of Fortune, and the theatre of Marcellus...

The height of the Ionic column is, 18 modules, Principles. and that of the entablature 41, or one quarter of the height of the column, as in the other orders, which is a trifle less than in any of the antique Ionics. In all the antiques, the base is Attic; and the shaft of the column may either be plain, or fluted with 24 flutings, or 20 only, as in the temple of Fortune. The plan of the flutings may be a trifle more than a semicircle, as in the forum of Nerva, because they then appear more distinct. The fillets, or intervals between them, must not be broader than one third of the breadth of a fluting, nor narrower than one fourth. The ornaments of the capital must correspond with the flutings of the shaft; and there must be an ove above the middle of each fluting. The volutes ought to be traced according to Mr Goldman's method, which is as follows:

Plate XXXVIII. fig. 9. Draw the cathetus, F C, Method of whose length must be 15 minutes, or one-fourth of a drawing module: and from the point C, describe the eye of volutes the volute A E B D, of which the diameter is to be 67 minutes; divide it into four equal sectors by the diameters A B, D E. Bisect the radii C A, C B, in 1 and 4; and on the line 1, 4, construct a square, 1, 2, 3, 4. From the centre C, to the angles 2/3, draw the diagonals C 2, C 3, and divide the fide of the square 1, 4, into fix equal parts, at 5, 9, C, 12, 8. Then through the points, 5, 9, 12, 8, draw the lines 5, 6, 9, 10, 12, 11, 8, 7, parallel to the diameter E D, which will cut the diagonals in 6, 7, 10, 11, and the points, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, will be the centres of the volute. From the first centre 1, with the distance 1 F, describe the quadrant F G; from the second centre 2, with the diffance 2 G, defcribe the quadrant G H; and continuing the same operation from all the 12 centres, the contour of the volute will be completed,

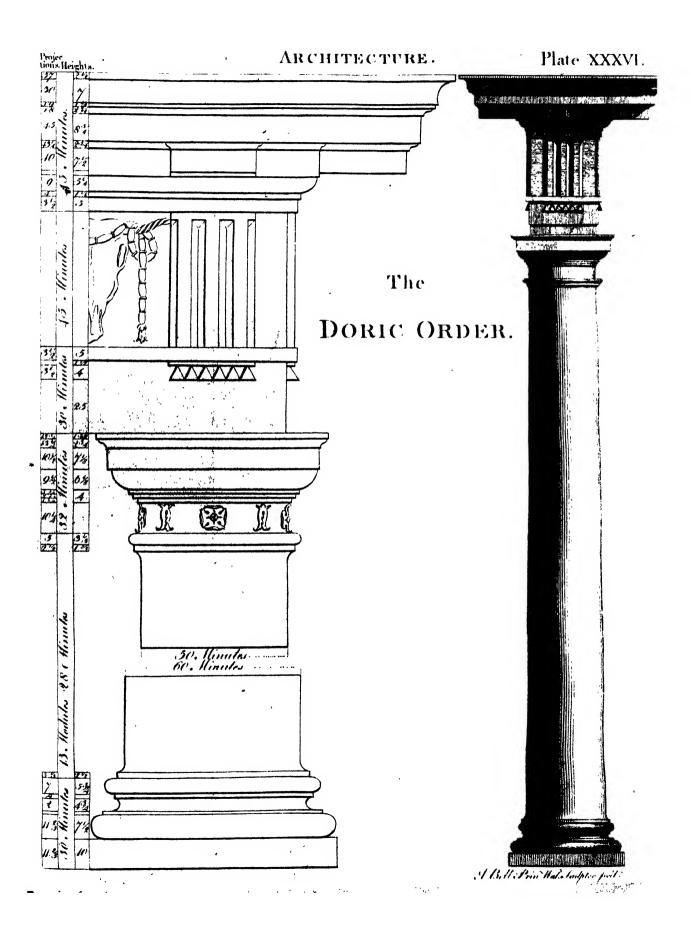

Fig. 10. The centres for describing the fillet are found in this manner. Construct a triangle, of whichthe fide A F is equal to the part of the cathetus contained between A F and the fide F V, equal to C 1; place the distance F S from F towards A, equal to F S the breadth of the fillet, and through the point S draw the line S T, which will be to C I in the same proportion as A S is to A F; place this line on the diameter of the eye A B: divide it into three equal parts; and through the points of division, draw lines, parallel to the diameter E D, which will cut the diagonals C 2, C 3, and you will have twelve new centres, from whence the interior contour of the fillet. may be described in the same manner as the exterior one was from the first centres.

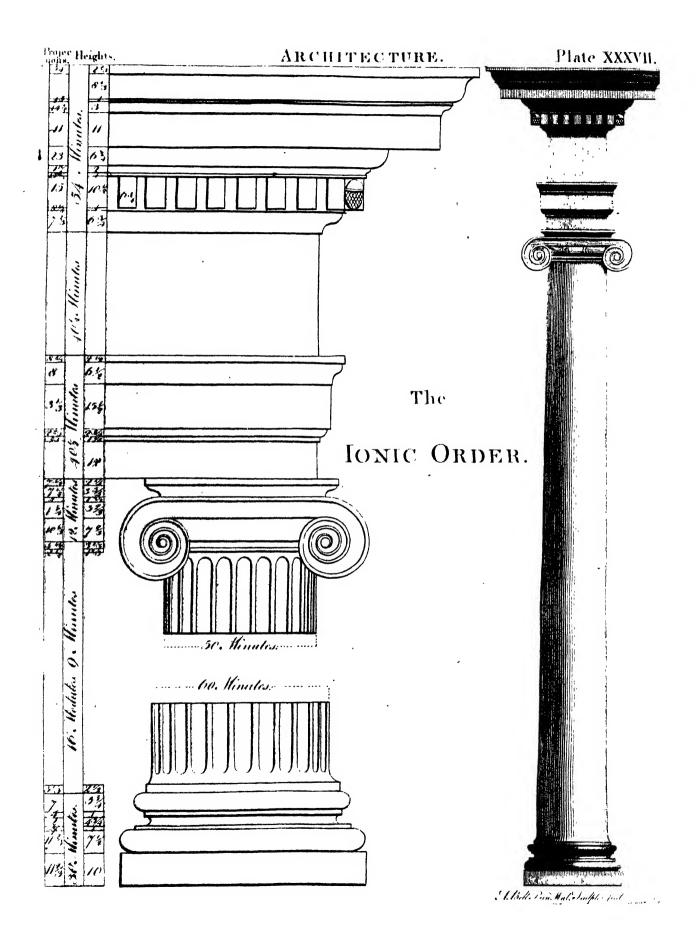

Of the Corinthian Order.

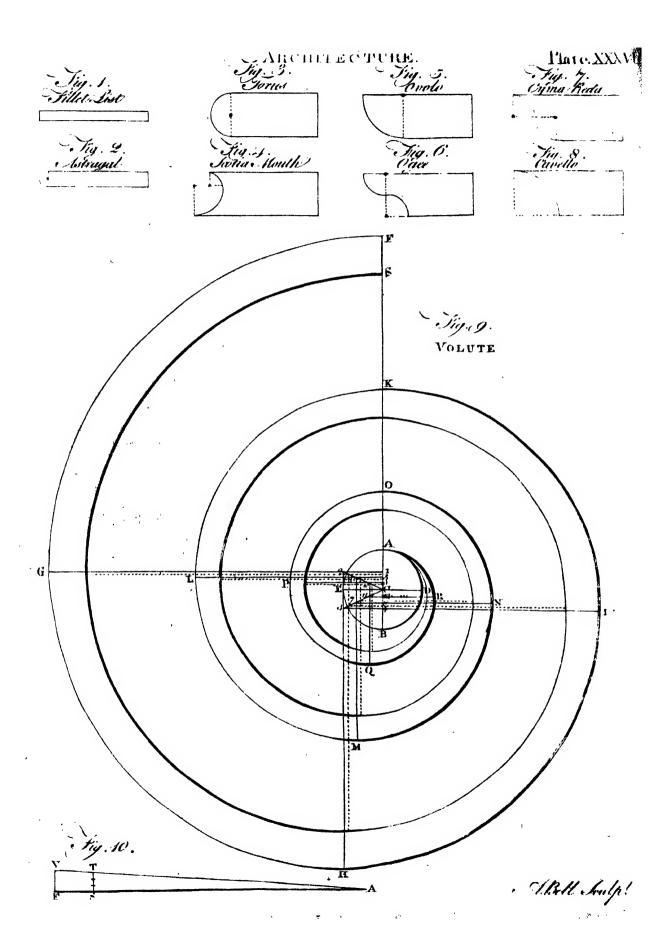

The proportions of this order are extremely deli-Plate cate. It is divided into a great variety of members, and enriched with a profusion of ornaments. Scamozzi calls it the virginal order; and indeed it has all the delicacy in its make, and all the delicacy in its dress, peculiar to young girls.

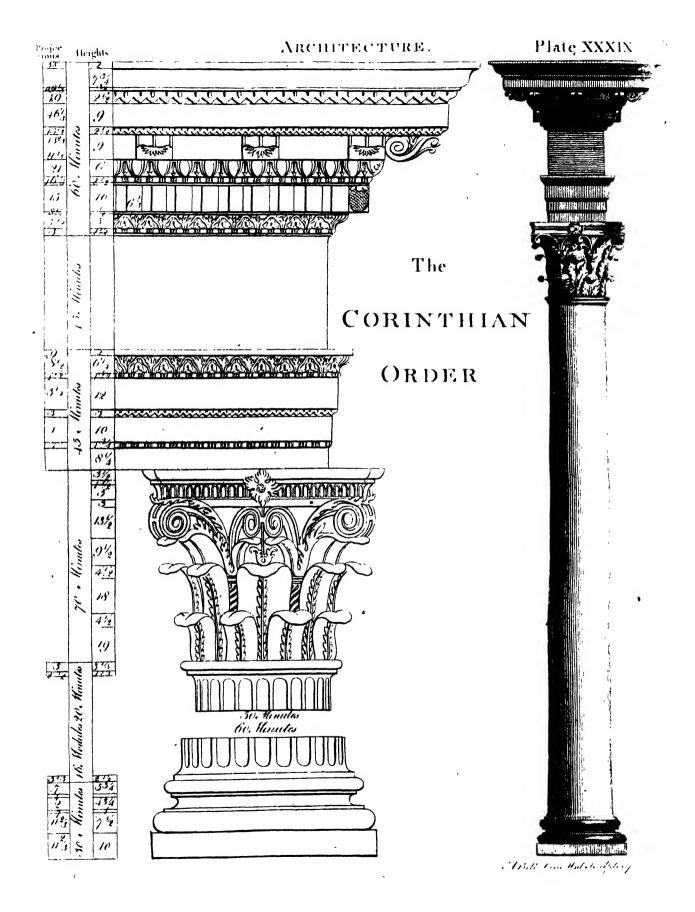

The most perfect model of the Corinthian order is generally allowed to be in the three columns in the Campo Vaccino at Rome, the remains, as it is thought, of the temple of Jupiter Stator.

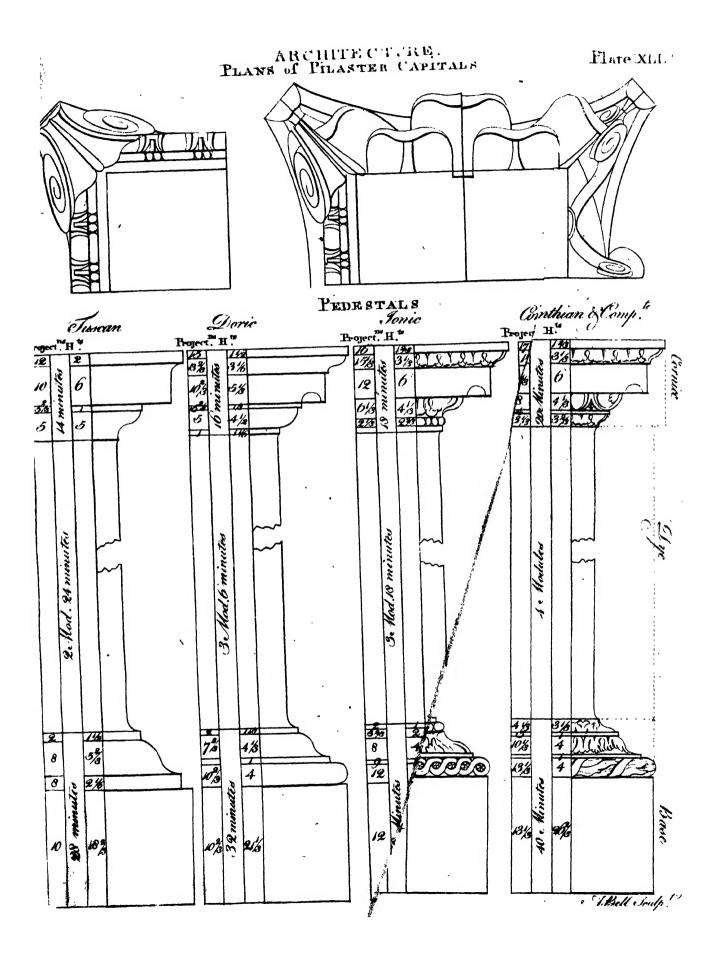

ï

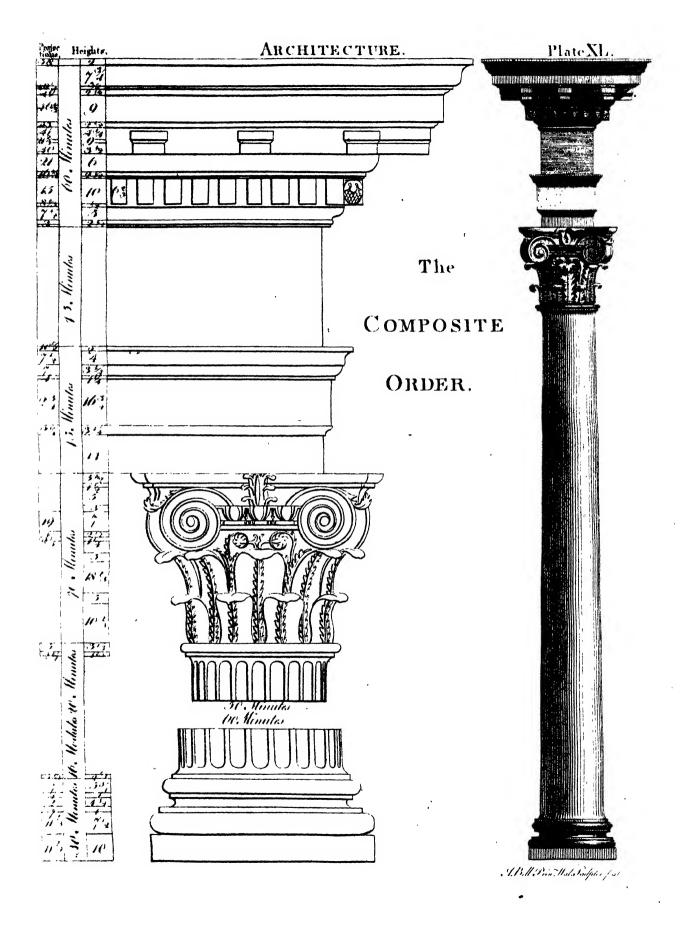

53

Principles.

The Corinthian column should be 20 modules high. and the entablature 5; which proportions are a medium between those of the Pantheon and the three columns. The base of the column may be either Attic or Corinthian: They are both beautiful. If the entablature be enriched, the shaft may be fluted. The flutings may be filled, to one-third of their height, with cabblings, as in the infide of the Pantheon; which will ftrengthen the lower part of the column, and make it less liable to injury.

In most of the antiques at Rome, the capital of this order is enriched with olive leaves; the acanthus being feldom employed but in the Composite. De Cordemoy, however, prefers the acanthus.

The divisions of the entablature bear the same proportions, to each other, as the Tufcan, louic, and Compolite orders.

The COMPOSITE

Place XL. Is, flrictly speaking, only a species of the Corinthian; and therefore retains, in a great measure, the same cha-

40 Different kinds of ornaments.

It does not appear that the ancients affected any particular form of entablature to this order. Sometimes the cornice is entirely plain, as in the temple of Bacchus; at others, as in the arch of Septimius Severus, it is enriched with dentils differing very little from the Ionic; and in the arch of Titus, there are both dentils and modilions; the whole form of the profile being the same with the Corinthian, as exccuted in the antiques at Rome.

The modern architects have varied more in this than in any other order, each following the bent of his own faucy.

The height of the Composite column, and parts of the entablature, is the same with that of the Corinthian. The foot of the leaves of the capital ought not to project beyond the upper part of the shaft. The different bunches of leaves should be strongly marked; the sprigs which arise between the upper ones should be kept flat upon the vase; and the ornaments of the volutes mult not project beyond the fillets that enclose them.

CHAP. II. Of Pilasters.

THISE differ from columns only in their plan; which is a square, as that of columns is round. Their bases, capitals, and entablatures, have the same parts, with the same heights and projections, as those of columns: they are also distinguished in the same manner, by the names of Tufcan, Doric, Ionic, Corinthian, and Composite.

The column is undoubtedly more perfect than the pilaster. However, they may be employed with great propriety on many occasions. Some authors declaim against pilasters, because, according to them, they do not admit of diminution. But this is a mistake; there are many instances, in the remains of antiquity, of their being diminished. Scamozzi always gave his pilasters the same diminution as his columns: Palladio and Inigo Jones have likewise diminished them in many of their buildings.

Pilafters where useful

Pılasters are employed in churches, galleries, halls, and other interior decorations, to fave room; for, as they seldom project beyond the solid wall above

one quarter of their diameter, they do not occupy near Principles. so much space as columns. They are likewise used' in exterior decorations; fometimes alone, instead of columns, on account of their being less expensive; and fometimes they accompany columns, being placed behind them to support the architraves, where they enter the building, as in the Pantheon at Rome; or, in the fame line with them, to fortify the angles, as in the portico of Septimius.

When pilasters are used alone, they should project one quarter of their diameter beyond the walls. When placed behind columns, especially if they be very near them, they need not project above oneeighth of their diameter. But, when placed on a line with columns, their projection must be regulated by that of the columns; and confequently, it can never be lefs than a femidiameter, even when the columns are engaged as much as possible.

The shafts of pilasters are frequently adorned with How ornaflutings, in the fame manner as those of columns; the mented. plan of which may be a trifle more than a femicircle; their number must be seven on each face, which makes them nearly of the same size with those of columns. The intervals, or fillets, must either be one-third or onefourth of the fluting in breadth.

The capitals of pilasters are profiled nearly in the Plate XLI. fame manner as those of columns.

CHAP. III. Of Attics.

THESE very properly follow the pilatters; being nothing more than fquare pillars with their cornices. They had their origin in Athens, where it was for many ages a rule in building to conceal the roof. For this purpose, nothing served so well as a kind of low or little order ranged in a continued line, fingly, or with the interruption of ballusters; which, riling above the rest of the work and before the roof, hid it perfectly, and placed fomething agreeable in view. The place of Attics, therefore, is at the uppermost extremity of a building, to which they serve as a crown, or very properly make a finishing for the other orders when they have been used in the fliucture. They must never sland under any thing except fuch ornaments as are placed at the very top. Thefe Attics should never exceed in height one-third of the height of the order on which they are placed, nor be less than one quarter of it. The base, dye, and cornice, of which they are composed, may bear the same proportions to each other as those of pedestals do; and the base and cornice may be composed of the same mouldings as those pedestals. Sometimes the Attic is continued throughout; at others, it projects, and forms a pilaster over each column of the order. The breadth of this pilaster is feldom made narrower than the upper diameter of the column below it, and never broader. Its projection may be equal to one quarter of its breadth.

CHAP. IV. Of Perfians, Caryatides, and Termini.

Besides columns and pilasters, it is sometimes customary to employ representations of the human figure, to support entablatures in buildings. The male figures are called Perfians; and the female, Carians, or Caryatides.

54

Origin of Perfians.

The Persians are so called from a victory gained over the Persians, by Pausanias, who having brought home spoils and trophies to the Athenians, they fixed upon Persian figures for those which should support entablatures, and thus kept in mind that there were once Persian slaves in Athens. To represent these conquered people in the lowest state possible, they loaded them with the heaviest entablature, viz. that of the Doric order. In process of time, however, other figures belides those of Perlians were introduced, and other entablatures put over them; but the name was flill retained.

Of Caryatides.

The proper Caryatides are women dreffed in long robes, after the Afiatic manner; and the origin of the device was as follows:-The Carians had been long at war with the Athenians; but being at length totally vanquished, their wives were led away captives; and, to perpetuate the memory of this event, trophics were erected, in which figures of women dreffed in the Caryatic manner, were used to support entablatures like the Persians; and though other female figures were afterwards used in the same manner, the name of Carytides was always retained.

The ancients made frequent use of Persians and Caryatides, and delighted in diversifying them a The modern artists have followed thousand ways. their examples; and there is a great variety of compolitions of this kind to be met with in different parts

Indecent attitudes, difforted features, and all monstrons productions, ought to be avoided, of which there are many examples in Gothic buildings. On the contrary, the attitudes should be simple and graceful, the countenance always pleafing, though varied and firougly marked agreeable to the nature of

the object represented.

Their proportions, æc.

The Caryatides, or female figures, should never much exceed the human fize. But the Perfians or male figures, may be of any fize; and the larger the better, as they will strike the beholder with the greater awe and aftonishment. Persians may be used with propriety in arfenals, galleries of armour, &c. under the figures of captives, heroic virtues, &c. Their entablature ought to be Dorie, and bear the same proportion to them as to columns of the same height. The entablature for Caryatides ought to be either Ionic or Corinthian, according as the character of the figures is more or less delicate.

Termini.

Termini are sometimes employed, instead of Perfians or Caryatides, to support the entablatures of monuments, chimney-pieces, and fuch like compositions. These figures owe their origin to the stones used by the ancients to mark the limits of particular possesfions. Numa Pompilius, to render these inviolable, confecrated the terminus into a deity, and instituted fellivals and facrifices to his honour. In a fhort time. what were formerly only large upright flones, were represented in human shape; and afterwards introduced as ornaments to temples and other buildings. The termini are now principally used as ornaments for gardens and fields.

CHAP V. Of Pedeftals.

Most writers confider the Pedefial as a necessary part of the order, without which it is not complete.

It is indeed a matter of little importance whether it Principles. be confidered in that light, or as a diffiner composition; we shall therefore treat of a pedeltal as a diflinct body, having no more connexion with the order than an attic, a basement, or any other part with which it may on fome occasions be affociated.

A pedefial confills of three principal parts: the base, the dye, and the cornice. The dye is always nearly of the same figure; being constantly either a cube or a parallelopipedon: but the base and cornice are varied and adorned with more or fewer mouldings, according to the simplicity or richness of the composition in which the pedestal is employed. Hence pedestals are, like columns, distinguished by the names of Tufcan, Doric, Ionic, Corinthian, and Com-

Site. Some authors are averse to pedestals, and compare Pedestals, a column raifed on a pedeftal to a man mounted on where proflilts; imagining that they were introduced merely per-

from necessity, and for want of columns of a sufficient length. It is indeed true, that the ancients often made use of artifices to lengthen their columns; as appears by fome that are in the Baptistery of Conflantine at Rome; the shafts of which, being too short for the building, were lengthened and joined to their bases by an undulated sweep, adorned with acanthus leaves. Nevertheless, there are many occasions where pedeftals are evidently necessary; and some in which the order, were it not so raised, would lose much of its beautiful appearance. Thus, in the infides of churches, if the columns that support the vault were placed immediately on the ground, the feats would hide their bases and a good part of their shafts; and in the theatres of the ancients, if the columns of the scene had been placed immediately on the stage, the actors would have hid a part of them from the audience. In anterior decorations, a pedestal diminishes the parts of the order, which otherwise might perhaps appear too clumfy, and hath the advantage of placing the column in a more favourable view, by railing its base nearer the level of the spectator's eye. In a second order of arcades, there is no avoiding pedeftals; as without them it is impossible to give the arches any tolerable proportion.

With regard to the proportion that pedeftals ought Their proto bear that of the columns they support, it is by portions. no means fixed. Both the ancients and moderns vary greatly on this head. Vignola's proportions are generally reckoned the best. He makes his pedestals in all the orders of the fame height, viz. one third of the column; and as their breadth of course increases or diminishes in the same degree as the diameters of their respective columns do, the character of the order is always preferred, which, according to any other method,

is impossible.

As to the divisions of the pedestals; if the whole height be divided into nine parts, one of them may be given to the height of the cornice, two to the base, and the fix remaining to the dye. The breadth of the dye is always made equal to that of the plinth of the column. The projection of the cornice may be made equal to its height; and the base being divided into three parts, two of them will be for the height of the plinth, and one for the mouldings, whose projection must be less than that of the cornice.

Principles measures are common to all pedestals. See Plate

CHAP. VI. Of Intercolumniations.

Co'LUMNS are either engaged, or infulated; and, when infulated, are either very near the wall, or at a confiderable diffance from it. Engaged columns, or fuch as are near the walls of a building, are not limited in their intercolumniations, as these depend on the breadths of the arches, windows, niches, or other decorations placed between the columns. But columns that are entirely detached, and perform alone the office of supporting the entablature, as in periflyles, porches and galleries, mult be near each other, for the

fake both of real and apparent folidity.

63 Different intercolummiations used by the aucients.

Uled by

Vignola.

The intercolumniations among the ancients were various. Those used in the Ionic and Cormthian orders were the pycnostyle, of which the interval was equal to one diameter and a half of the column; the fyflyle whose interval was equal to two diameters: the cultyle, to two and a quarter; the dialtyle to three, and the armoftyle to four. In the Doric order, they used other intercolumniations, regulating them by the triglyphs, one of which was always placed directly over the middle of each column; fo that they were either systyle, monotriglyph, of one diameter and a half; diastyle, of two diameters and three quarters; or arzoftyle, of four diameters; and the Tuscan intervals were very wide, fome of them being above feven diameters, which was very practicable, as the architraves were of wood.

Among these different intercolumniations, the pycnoftyle and fyltyle are too narrow; for although the ancients made frequent use of them, that ought rather to be ascribed to necessity than choice. For as the architraves were composed of fingle stones, extending from the middle of one column to the middle of another, it would have been difficult, especially in large buildings, to find blocks of a fufficient length for diaftyle intervals. With regard to the armoftyle and Tuscan intercolumnations, they are by much too wide, and can only be uted in ruftic buildings, where the architraves are of wood; neither is the diastyle fufficiently folid in large compositions. The euftyle is a medium between the narrow and broad intervals; and being at the fame time both spacious and folid, hath been preferred to any of the rell by the ancients as well as the moderns.

Vignola observed nearly the same proportion in all his intercolumniations; which practice, though condemned by feveral writers, is certainly preferable to any other; as it preserves the character of each order, and maintains in all of them an equal degree of real folidity. Setting afide therefore the pycnoftyle and fystyle dispositions on account of their want of space, and the arzoftyle for its deficiency in point of trength, it may be established, that the diastyle and eustyle intercolumniations (the latter of which on most occa-

fions, ought to have the preference) may be employed in all the orders without diffinction, excepting the Doric; in which the most perfect interval is ditriglyph; neither the monotriglyph, nor the armoftyle

being to be fuffered but in cases of necessity. Sometimes, on account of the windows, doors, niches, and other decorations, which correspond with the intercolumniations of the penalyle, or gallery, it is Principles not possible to make the intervals so narrow as curtyle, or even as diaflyle: wherefore the moderns, authorifed by fome few examples of the ancients, where grouped columns are employed, have invented a manner of disposing them, called by Perrault arcostyle, which admits of a larger interval, without any detriment to the apparent folidity of the building. This kind of disposition is composed of two systyle intercolumniations; the column that separates them being approached towards one of those at the extremities, fufficient room only being left between them for the projection of the capitals; fo that the great space is three diameters and a half wide, and the little one half a diameter.

In periffyles, galleries, or porticos, all the intercolumniations must be equal; but in a logio, or porch, the middle interval may be broader than the others, by a triglyph or modilion, or three or four dentils; unless the columns at the angles be coupled or grouped with pilasters; in which case, all the intervals should be of the fame dimensions.

When buildings are very small, as is frequently the case in temples and other inventions used for ornamenting gardens, the intercolumniations may be broader, in proportion to the diameter of the columns, than ufual; because, when they are nearer each other than three feet, there is hardly room for a bulky person to pass between them.

CHAP. VII. Of Arches.

ARCHES are not so magnificent as colonnades; but Arches, they are more folid and lefs expensive. They are where proproper for triumphal entrances, gates of cities, of Per. palaces, of gardens, and of parks, and, in general, for all openings that require an extraordinary breadth.

There are various manners of adorning arches. How a-Sometimes their piers are rufticated; fometimes they dorned. are adorned with pilasters, termini, or caryatides; and fometimes they are made fufficiently broad to admit niches or windows. The circular part of the arch is either furrounded with ruftic key-stones, or with an archivolt enriched with mouldings; which, in the middle, is sometimes interrupted by a confole, a mask, serving at the same time as a key to the arch, and as a support to the architrave of the order. The archivolt is fometimes supported by an impost, at the head of the pier; and at others by columns placed on each fide of it, with a regular entablature, or architrave and cornice. There are likewise instances of areades without piers, the arches being turned on fingle columns as in the temple of Faunus at Rome, &c. This practice, however, ought to be feldom imitated, as it is neither folid nor handfome.

When arches are large, the key-stone should never be omitted, but cut in the form of a confole, and carried close under the soffit of the architrave, which on account of its extraordinary length, requires a fupport in the middle. The imposts of arches should never be omitted; at least, if they be, a platform ought to fupply their place. If columns are employed without pedestals in arcades, they should always be raised on a plinth. In all arches, the circular part ought not to fpring immediately from the impost, but

ARCHITECTURE.

Plate XLII.

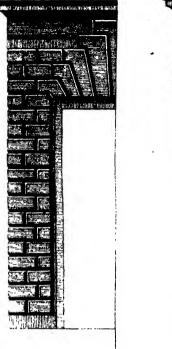

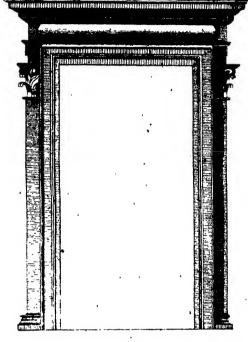

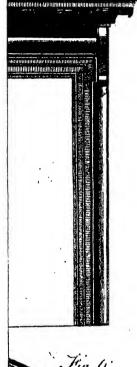

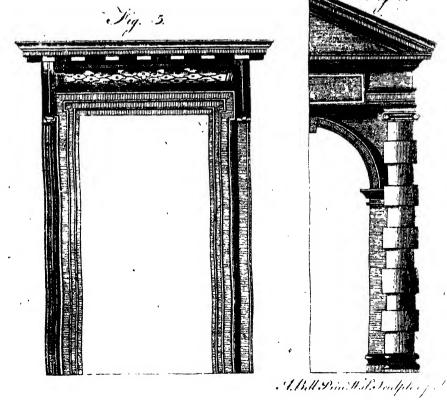

Fig. 1.

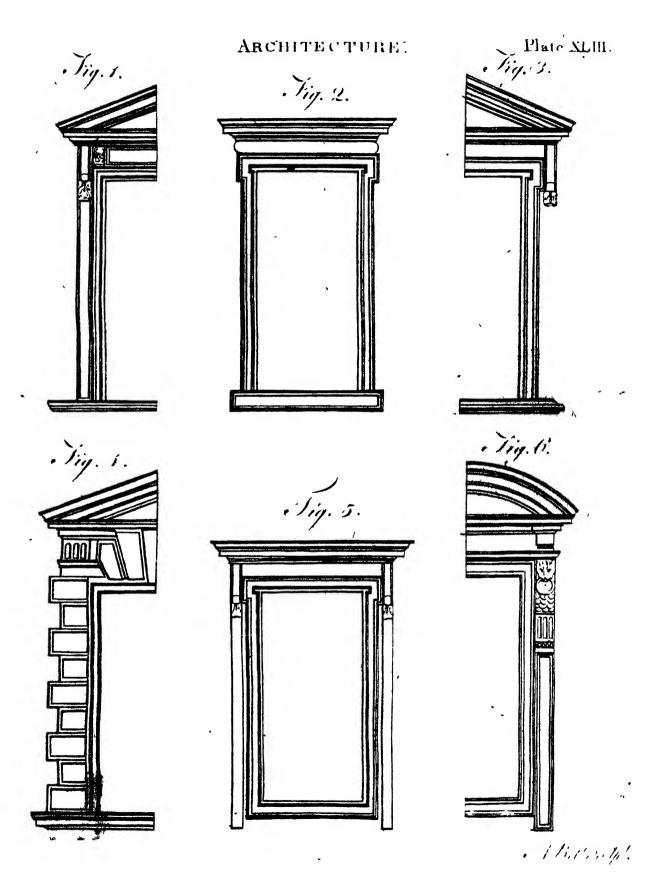

Principles, and crowned with a frize and cornice. The windows of the ground floor are fometimes left entirely plain, without any ornament: and at others they are furrounded with ruftics, or a regular architrave with a frize and cornice. Those of the second floor have generally an architrave carried entirely round the aperture; and the same is the method of adorning Attic and Mezzauine windows: but the two last have seldom either frize or cornice; whereas the fecond floor windows are often crowned with both.

> The breaks of all the windows on the same floor should be on the same level, and raised above the sloor from two feet nine inches to three feet fix inches at the very most. When the walls are thick, the breasts should be reduced under the apertures, for the conveniency of looking out. In France, the windows are frequently carried quite down to the floor. When the building is furrounded with gardens, or other beautiful objects, this method renders the rooms exceeding pleafant.

The interval between the apertures of windows depends in a great measure on their enrichments. The breadth of the aperture is the least distance that can be between them; and twice that breadth should be the largest in dwelling houses; otherwise the rooms will not be fufficiently lighted. The windows in all the stories of the same aspect must be placed exactly above one another.

Plate XLIII. fig. 1. is a defign of P. Lescot, abbot of Clagny, executed in the old Louvre at Paris. The apertures may be a double square, or a trifle more; the architrave from one fixth to one feventh of the breadth of the aperture: the pilaster is equal to that breadth, when the architrave is narrow; or lefe by one quarter, or one fifth, when it is broad. The whole entablature should not exceed one quarter of the height of the aperture, nor be much lower. The confoles may be equal in length to half the breadth of the aperture at most, and to one third of it at least.

Fig. 2. is a defign of Palladio's, executed at the Chiericato in Vicenza: its proportions are not much different from the following. The plat-hand that supports the window is equal to the breadth of the architrave.

Fig. 3. is likewife a defign of Palladio's, executed by him in many of his buildings. The aperture is a double square. The breadth of the architrave is one fixth of the breadth of the aperture; and the frize and cornice together are double the height of the architrave. The breadth of the consoles is two thirds of the breadth of the architrave.

Fig. 4. is a defign of Ludovico da Cigoli; and executed in the ground floor of the Ranunchini palace at Florence.

Fig. 5. is a defign of Inigo Jones, executed at the Banqueting House. The aperture may be a double fquare; the architrave may be one fixth of its breadth; the whole entablature one quarter of its height; and the breadth of the confoles two thirds of the breadth of the architrave.

Fig. 6. is a defign of M. Angelo Buonaroti, exccuted at the Farnese.

CHAP. XIV. Of Niches and Statues.

IT hath been customary, in all ages, to enrich differ-

ent parts of buildings with representations of the hu- Principles man body. Thus the ancients adorned their temples, baths, theatres, &c. with flatues of their deities, heroes, and legislators. The moderns still preserve the same cultom, placing in their churches, palaces, &c. statues of illustrious persons, and even groups composed of various figures, representing occurrences collected from history, fables, &c. Sometimes thefe statues or groups are detached, raifed on pedeffals, and placed contiguous to the walls of a building, or in the middle of a room, court, or public square. But they are most frequently placed in cavities made in the walls, called niches. Of Different these there are two forts; the one formed like an arch kinds of in its elevation, and femicircular or femielliptical in its niches plan; the other is a parallelogram both in its plan and elevation.

The proportion of both these niches depends on the characters of the statues, or the general form of the groups placed in them. The lowest are at least a double square in height; and the highest never exceed 2 tof their breadth.

With regard to the manner of decorating them, how decor when they are alone in a composition, they are gene-rated. rally enclosed in a pannel, formed and proportioned like the aperture of a window, and adorned in the fame manner. In this case the niche is carried quite down to the bottom; but on the fides and at the top, a small space is left between the niche and the architrave of the pannel. And when niches are intermixed with windows, they may be adorned in the fame manner with the windows, provided the ornaments be of the same figure and dimensions with those of the

The fize of the statues depends on the dimensions of Statues. the niches. They should neither be so large as to have the appearance of being rammed into the niches as in Sauta Maria Majora at Rome; nor fo narrow as to feem loft in them, as in the Pantheon. The diffance between the outline of the statue and side of the niche should never be less than one third of a head, nor more than one half, whether the niche be fquare or arched; and when it is square, the distance from the top of the head to the cicling of the niche should not be greater than the diffance on the fides. Statues are generally raised on a plinth, the height of which may be from one third to one half of a head; and fometimes, where the niches are large, the statues may be raifed on small pedestals.

The character of the statue should always correspond with the character of the architecture with which it is furrounded. Thus, if the order be Doric, Hercules, Jupiter, Mars, Æsculapius, and all male statues, representing beings of a robust and grave nature, may be introduced; if Ionic, then Apollo, Bacchus, &c.; and if Corinthian, Venus, Flora, and others of a delicate nature, should be employed.

CHAP. XV. Of Chimney-pieces.

Among the ancients there are very few examples of of chimney-pieces to be met with. Neither the Italians nor French have excelled in compositions of this kind. Britain, by being possessed of many able sculptors at different times, has furpassed all other nations, both in tafte of defign, and workmanship. Hh 2

8 c tions

The fize of the chimney must be regulated by the dimensions of the room where it is placed. In the fmallest apartments, the breadth of the aperture should Proportions never be less than three feet, or three feet fix inches. In rooms from 20 to 24 feet square, or of equal superficial dimensions, it may be from 4 to 41 feet broad; in those of 24 to 27, from 4; to 5; and in such as exceed these dimensions, the aperture may even be extended to 53 or 6 feet.

> The chimney should always be situated so as to be immediately feen by those who enter the room. The middle of the partition wall is the most proper place in halls, faloons, and other rooms of passage; but in drawing-rooms, dreffing-rooms, and the like, the middle of the back wall is the best situation. In bedroom; the chimney is always in the middle of one of the partition walls; and in closets and other very finall places, to fave room, it is put in a corner. Whereever two climneys are uled in the fame room, they should be placed either directly facing each other, if in different walls, or at equal diffances from the centre of the wall in which they both are.

> The proportion of the apertures of chimney-pieces of a moderate fize is generally a perfect fquare; in small ones, it is a trifle higher; and in large ones, a trifle lower. Their ornaments confift in architraves, frizes, coinices, columns, pilasters, termini, caryatides, confoles, and all kinds of ornaments of sculpture, reprefenting animals and vegetables, &c. likewife vafes, chalices, trophics of arms, &c. In defigning them regard must be had to the nature of the place where they are to be employed. Such as are intended for halls, faloons, guard-rooms, galleries, and other large places, mult be composed of large parts, few in number, of diffinct and simple forms, and having a bold relief; but chimney-pieces for drawing-rooms, dreffing-rooms, &c. may be of a more delicate and complicated nature.

> Chimney-pieces are composed of wood, stone, or marble; the last of which ought to be preferred, as figures or profiles are best represented in a pure white.

> Plate XLIV. exhibits different designs for chimney-pieces by Palladio and Inigo Jones. Their proportion may be gathered from the defigns, which are accurately executed.

CHAP. XVI. Of the Proportions of Rooms.

THE proportions of rooms depend in a great meafure on their use and actual dimensions; but, with regard to beauty, all figures, from a fquare to a fefquilateral, may be employed for the plan.

The height of rooms depends on their figure. Flat cieled ones may be lower than those that are coved. If their plan be a square, their height should not exceed five-fixths of the fide, nor be less than four-fifths; and when it is oblong, their height may be equal to their breadth. But coved rooms, if square, must be as high as broad; and when oblong, they may have their height equal to their breadth, more one-fifth one quarter, or even one-third of the difference been the length and breadth: and galleries should at be in height one and one-third of their breadth, and at most one and a half, or one and three-fifths.

The coldness of the British climate is a strong ob- Principles. jection to high rooms; fo that it is not uncommon to fee the most magnificent apartments not above 15, 16, Highrooms or at most 18 feet high; though the extent of the improper in rooms would require a much more confiderable eleva- Britain. tion. But where beauty is aimed at, this practice ought not to be imitated.

When rooms are adorned with an entire order, the entablature should never exceed one-fixth of the whole height in flat cicled rooms, and one-fixth of the upright part in coved ones; and when there are neither columns nor pilasters, but only an entablature, its height should not be above one-seventh of these heights. If the rooms be finished with a simple cornice, it should never exceed one-fourteenth, nor ever be lefs than one-fifteenth part of the above mentioned height.

CHAP. XVII. Of Ciclings.

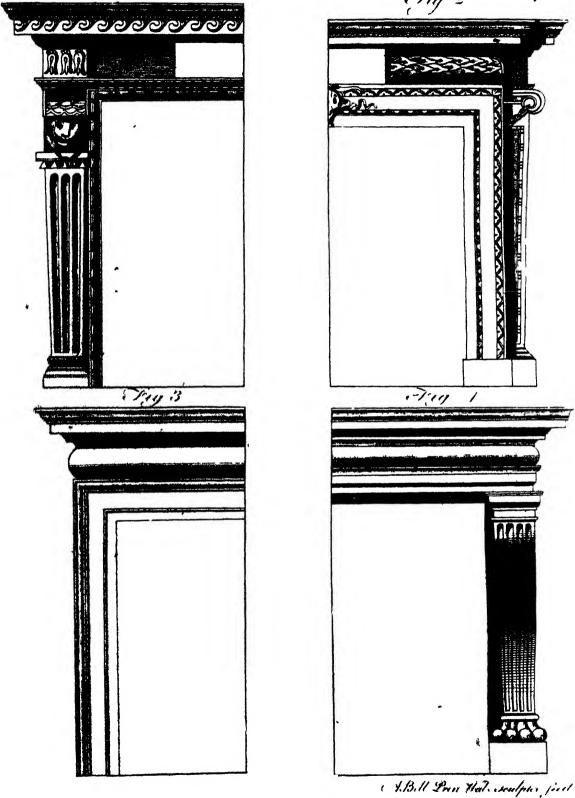

CIELINGS are either flat, or coved in different man-The simplest of the flat kind are those adorned with large compartments, furrounded with one or feveral mouldings, either let into the ceiling, or projecting beyond its furface; and when the mouldings that form the compartments are enriched, and some of the compartments adorned with well executed ornaments, fuch ciclings have a good effect, and are very proper for common dwelling houses, and all low apartments. Their ornaments and mouldings do not require a bold relicf; but, being near the eye, they must be finished with talle and neatness. For higher rooms, a flat cieling which has the appearance of being composed of various joills framed into each other, and forming compartments of various geometrical figures, should be employed. The fides of the joifts forming the compartments are generally adorned with mouldings, and represent either a simple architrave, or an architrave cornice, according to the fize of the compartments and the height of the room.

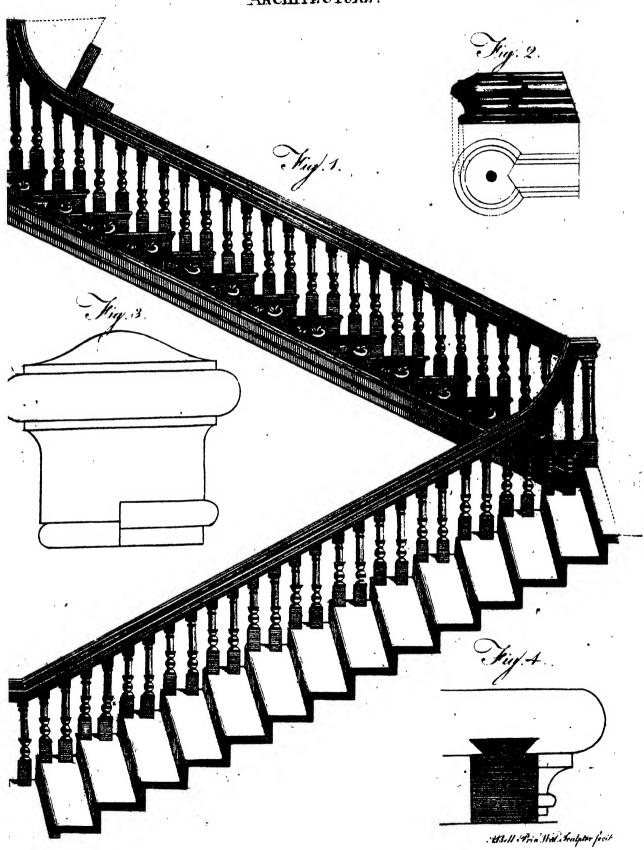

Coved ciclings are more expensive; but they are likewise more beautiful. They are used promiscuously in large and small rooms, and occupy from one fifth to one third of the height of the room. If the room be low in proportion to its breadth, the cove must likewife be low; and when it is high, the cove must be so likewife: by which means the excess of the height will be rendered less perceptible. But, where the architect is at liberty to proportion the height of the room to its superficial dimensions, the most eligible proportion for the cove is one-fourth of the whole height. In parallelogram figured rooms, the middle of the ceiling is generally formed into a large flat pannel. This pannel, with the border that furrounds it, may occupy from one half to three fifths of the breadth of the room. The figure of the cove is commonly either a quadrant of a circle or of an ellipse, taking its rife a little above the cornice, and finishing at the border round the great pannel in the centre. The border projects somewhat beyond the coves on the outfide; and, on the fide towards the pannel, it is generally made of fufficient depth to admit the ornaments of an architrave, or architrave and cornice.

In Britain circular rooms are not much in use; but

ARCHITECTURE.

Plate XLIV.

Staircafes

placed.

ECTURE

Principles, they are very beautiful. Their height must be the fame with that of square rooms; their ciclings may be flat; but they are handsomer when coved, or of a concave form.

> Arcs doublaux, or foffits of arches, when narrow, are ornamented with guillochs, or frets; but when broad, they may be adorned in a different manner.

> When the profiles of the room are gilt, the cielings ought likewise to be gilt. The usual method is to gild all the ornaments, and to leave the grounds white, pearl colour, light blue, or of any other tint proper to set off the gilding to advantage. Painted cielings, fo common in France and Italy, are but little used in Britain.

CHAP. XVIII. Of Stairs and Staircases.

THERE are many kinds of staircases: for, in some, the steps are made straight; in others winding; in others, mixed of both. Of straight stairs, some fly directly forward, others are square, others triangular. Others are called French flights; or winding flairs, (which in general are called spiral, or cockle stairs); of which some are square, some circular or round, and fome elliptical or oval; and these again are various, fome winding about a folid, others about an open newel. Stairs mixed of straight and winding steps are also of various kinds; some are called dog-legged; fome there are that wind about a folid newel, and othere that fly about a square open newel.

Great care ought to be taken in placing of the where to be staircase in any building; and therefore staircases ought to be described and accounted for justly when the plan of a building is made. For want of this, fometimes unpardonable errors have been committed: fuch as having a little blind staircase to a large house, er, on the other hand, a large spacious staircase to a little one.

> Palladio says, in placing staircases, the utmost care ought to be taken; it being difficult to find a place convenient for them, that will not at the same time prejudice the rest of the building. But commonly the flairs are placed in the angle, wing, or middle of

To ver " a cife are required three openings.

First, in love 1 ding thereto.

Secondly, The window, or windows that give light to it;

And, Thirdly, The landing.

First, The door leading to the staircase should be fo placed, that most of the building may be feen before you come at the stairs, and in such a manner that it may be easy for any person to find out.

Secondly, For the windows; if there be but one, it must be placed in the middle of the staircase, that thereby the whole may be enlightened.

Thirdly, The landing of stairs should be large and spacious for the convenient entering into rooms; in a word, staircases should be spacious, light, and easy in ascent. The height of large steps must never be less than six inches, nor more than seven inches and a

The breadth of steps should never be less than 10 inches, nor more than 18 inches; and the length of them not less than three feet, nor more than 12.

Plate XLV, fig. 1. A flaircufe of two flights,- Principles A shows the manner of drawing the ramp, which is to rife equal to the height of the first step of the next flight, and as much as its kneeling; as is shown by the ramp intersecting the rail of the second flight.

Fig. 2. shows the straight rail intersecting a cir-

cular cap.

Fig. 3. fection of two different hand rails.

Fig. 4. shows the manner of dove-tailing the rifer into the step.

Plate XLVI. fig. 1. represents a staircase, with

flights, and its landing rail.

Fig. 2. shows the solid part of the step out of which the scroll is formed; where a represents the oversuil of the step; b, The thickness of the bracket, with its mitring to the rifer; and c, The firing board.

Fig. 4. shows the scale for drawing the scroll of fig. 3.—To perform which, take the distance from I to the centre, in fig. 3. and fet it from 1 to the centre in fig. 4; divide that extent into three parts, then fet 4 such parts on the upper side of the scale, and draw the line from 4 to one; fet one foot of your compasses at 4, and strike the circular line; let that be divided into 12 equal parts, and then draw lines from 4 through those divisions to the upright line.

The scale being thus made, draw the scroll of sig. 3.

by it in the following manner.

Set one foot of your compasses in 1, and describe a stroke at c; take the same distance, and with one foot in 2, cross the stroke at c; then from c, turn the part from 1 to 2, and proceed in the same manner: for if the distance were taken in the scale from I to the centre, it would firike the circle too flat; and if taken from 2, it would strike the circle too

When this is well understood, there will be little difficulty in drawing the fcroll below fig. 2.; which throws itself out farther in proportion than that in fig 3.; for this will always be the case when the upper line of the scale, which consists of four divisions in fig. 4. is made but with three divitions or lefs; whence it appears, that the upper line of the scale may be drawn at what length you please, according as you would bring in or keep out the scroll.

Plate XLVII. shows the manner of squaring twist

rails.

Fig. 2. exhibits the pitch board, to show what part of the step the twisted part of the rail contains; the three doted lines drawn from the rail to the pitch board represent the width of the rail, which is to be kept level. The doted lines a and b show how much half the width of the rail turns up from its first beginning to 3.

Fig. 3. shows the same pitch board with the manner of the rail's turning up. If the fides of the twifted part of the rail be shaped by the rail mould, so that they direct down to its ground plan, that is, the upper fide of the rail being first struck by the mould, then apply the mould to the under side, as much back as the level of the pitch board shows, by being struck on the fide of the rail, and then fig. 3. being applied to the outside of the rail, from its first twifting part to 3, will show how much wood is to be taken off.

Practice.

Fig. 5. exhibits the fquare of the rail, with the raking line of the pitch board drawn through the middle on the upper fide; then draw the depth of the fide of the rail parallel to this, and the dotted lines from the diagonal of the rail; thele lines thow what quantity of wood will be wanting on the upper and lower fides of the rail. Set your compasses at c, and draw the circular stroke from the raking part of the pitch board to b; take the distance a b and transfer it from a to b, in fig. 7. The feveral distances thus found may be fet at any number of places, ranging with the straight part of the rail; and it then forms the width of the mould for the twifting part of the rail.

. Fig. 7. shows the sweep of the rail. The rail cannot be fixed less than one fourth part from the

no jug or front of the ftep.

The remaining part of the pitch board may be divided into any number of parts, as here into four; from these divitions draw lines across the pitch board to the raking line; then take the distances from the ground line of the pitch board to the plan of the rail, and fet them perpendicular from the raking line of the pitch board; and these divisions, when the rail is in its proper polition, lie directly over the divisions on the ground plan.

In this figure 1, m, and n, rife as much above o as the dotted line in fig. 5. does above the width of the rail; and they fink as much below o as the other dotted line in fig. 5. falls below the width of the rail; the fame thickneffes must be glued upon o, though the greatest part will come off in squaring. The reason of placing the letters l, m, and n, where they are, is, that they might not obstruct the small divisions of the rail mould.

Fig. 4. shows how to find the rail when it takes more than one step. The remaining part of the pitch board is divided into four parts, as before in fig. 7. and it takes in two fuch parts of the next step. Draw lines from these divisions to the diagonal of the pitch board as in fig. 7. then take the distance a b, and fet it from e to d, and so proceed with the other divisions.

Another way to find the outfide of the rail mould is, to draw all the divisions across the plan of the rail; then take the distance from the ground line of the pitch board to 4, transfer it from the diagonal of the pitch board to 4 on the rail; and fo proceed with

the other distances. Now, when the rail is put in its Prastice. proper fituation c will be perpendicular to b, and all the divisions, as 1, 2, 3, 4, &c. in the rail, will be perpendicular to 1, 2, 3, 4, &c. in the ground plan. Fig. 6. shows the plan of a rail of five steps.

To find the rail. - Set five divisions, as from e to b, which is the height of the five steps; draw the diagonal b to the plan of the rail; then take the distance e f, and transfer it to g b, and proceed in the same manner with the other feven diftances.

To find the width of the rail mould .- Draw the lines across the plan of the rail, as at &; fet that distance from the diagonal to i; and so proceed with the rest, as shown in sig. 4.

Having formed the fides of the rail perpendicular to its ground plan, and having squared the lower end of the rail, then take a thin lath, and bend it with the rail. as is represented by m. fig. 1.

This is the readiest method of squaring a solid rail; but if the rail be bent in the thicknelles, the noting of the steps must be drawn upon a cylinder, or some other folid body of a sufficient width to contain the width of the rail or firing board.

r Represents the depth of the rail, touching the nose of each step. Take a sufficient number of thicknesses of this width, to make the thickness of your rail, glue them altogether upon your cylinder or templet; confine them till they are dry, and the rail taken off is ready fquared. Proceed in the same manner with the architrave, marked a.

CHAP. XIX. Of Roofs.

PLATE XLVIII. Fig. 1. shows the form of a trusfed roof, with three ring posts, that may carry feventy feet or upwards.

Fig. 2. exhibits an M roof, capable of carrying as great an extent as the former. Indeed both these defigns are capable of carrying almost any extent.

Fig. 3. represents two different forts of truffes. Fig. 4. shows the manner of piecing timber. Sometimes the joint may be extended as far as a, with another bolt through it. To the right is shown a different

fort of joint. Fig. 5. shows the manner of trusting a girder. If the truffes are full long, with the pieces b and c, you may make them as light as you please.

Fig. 6. represents the manner of trusting partitions.

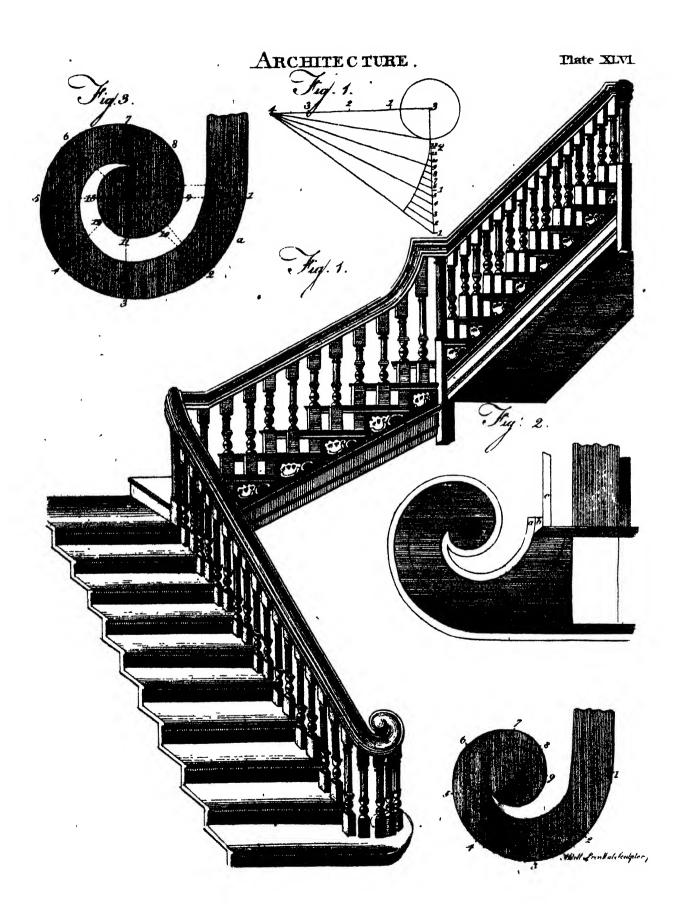

PART II. PRACTICE OF ARCHITECTURE.

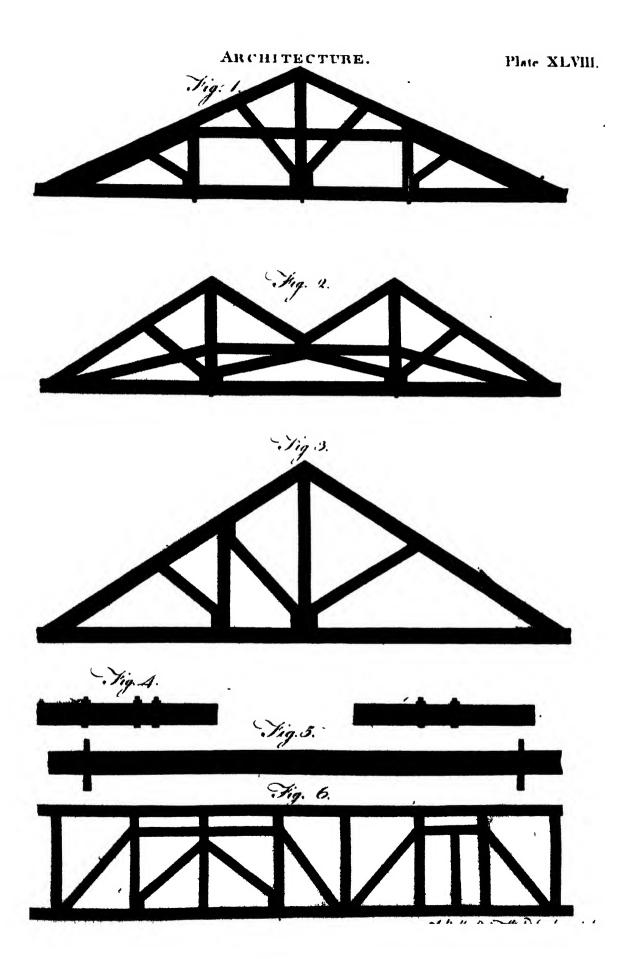

HAVING thus described and given rules for the most generally received proportions of the different Parts of buildings, both of the useful and ornamental kind, we must next give an account of the method of erecting different kinds of edifices; and here the judgement of the architect must necessarily be very much employed as no fixed rules have been laid down by which the hard be directed in all cases. As a necessary prelimited, however, to the construction, we must first conserve.

MAP. I. The Situations of Houses.

Tuesdan it must be, in many cases, impossible to choose such a situation as might be agreeable either to s wchien or the proprietor, yet where a choice can

be made, there are certainly a great many circumstances that will determine one situation to be preferable to another. These circumstances depend entirely on the person who is to inhabit the house. A farmer. for instance, ought to dwell in the most centrical part of his farm; an independent gentleman must regard the healthiness, the neighbours with whom he can converse, the prospect from his house, and also the aspect of the ground near it. To answer these purposes of health and pleasure, an open elevated situation is the best, as the air is there pure, and the prospect extensive. but too elevated a fituation is difagreeable, as being both difficult of access, and exposed to cold and bleak winds. To build in bottoms between hills is both unhealthful and unpleafant, the house being in a manner

Part II.

*Practice. buried, and the ground near it generally marshy from the rain water which runs down from the hills, which renders the air unwholesome. As a garden also is a very necessary article to a country habitation, the foil is by no means a matter of indifference; and therefore it may be concluded, that an elevated fituation on a gravelly loam, near some running water, is the best situation for a country house.

CHAP. II. Of the Construction of Edifices in general.

THE proper fituation of a house, or any other building, being chosen, according to its intended nature, the next thing to be confidered is to lay the foundation in a proper manner. The only fecurity of a house, or any other building whatever, is in having a good foundation, and no error is fo dangerous as that which is committed here; as the fhrinking of the foundation but the breadth of a thaw may cause a rent of five or Qualities of fix inches wide in the fuperstructure. To guard athe ground gainst errors of this kind, the qualities of the ground needlary to for a considerable depth must be carefully observed.

The best foundation is that which confists of gravel or stone; but, in order to know whether the inserior strata are sufficient for the support of the building, it will be advisable to fink wells at some little distance. By attending to what is thrown up in digging thefe, the architect will be acquainted with what lies under the stony or gravelly bed which on the furface promifes fo much fecurity, and will know what meafures

to take.

Rocky

į

ş

ground

metimes

dangerous.

But though a stony or gravelly bottom is undoubtedly the most fure and firm, where all is found beneath, there is no kind of ground which may prove more fallacious, or occasion such terrible accidents. The reason of this is, that fuch kind of ground often contains abfolite vacuities; nor is rock itself, though a foundation upon's rock is strong even to a proverb, free from dangers of the same kind. Caverns are very frequent in rocky places; and should a heavy building be erected over one of these, it might suddenly fall down altogether. To guard against accidents of this kind, Palladio advifes the throwing down great weights forcibly on the ground, and observing whether it founds hollow, or shakes; and the beating of a drum upon it, by the found of which an accustomed ear will know whether the earth is hollow or not.

Where the foundation is gravel, it will be proper to examine the thickness of the stratum, and the qualities of those that lie under it, as they have appeared in digging. If the bed of gravel is thick, and the under ftrata of a found and firm kind, there needs no affiftance; if otherwife, we must have recourse to various

methods in order to supply the defect.

The other matters which may occur for a foundation are clay, fand, common earth or rotten boggy ground. groundhow Clay will often both raife and fink a foundation; yet it has a folidity which, with proper management, is very useful. The marshy, rotten or boggy ground is of all others the worft; yet even upon this great buildings may be raifed with perfect fafety, provided proper care be taken. In case of boggy earths, or unfirm fand, piling is one of the most common methods of fecuring a foundation; and, notwithflanding the natural disadvantage of the earth, piles, when properly executed, are one of the firmest and most secure foun- Practical

R

In foundations near the edge of waters, we should 99 always be careful to found to the very bottom; as many trons near terrible accidents have happened from the ground be-waters dan ing undermined by rivers. The same method is to be gerous. followed when the ground on which we build has been dug or wrought before. It ought never to be trusted in the condition in which it is left; but we must dig through it into the folid and unmoved ground, and fome way into that, according to the weight and bigness of the intended edifice. The church of St Peter's Defect in at Rome is an instance of the importance of this last St Peter's observation. That church is in great part built upon the old circus of Nero; and the builders having neglected to dig through the old foundation, the func-ture is confequently fo much the weaker. The walls were judged of flrength enough to bear two fleeples upon the corners of the frontispiece; but the foundation was found too weak when it was impossible to remedy the defect perfectly.

Before the architect, however, begins to lay the foundation of the building, it will be proper to confirmet fuch drains as may be necessary for carrying off the rain, or other refuse water that would otherwise be collected and lodge about the house. In making of Drain- ho drains for carrying off this water, it will be necessary made. to make large allowances for the different quantities that may be collected at different times. It must also be confidered, that water of this kind is always loaded with a vall quantity of fediment, which by its continual

drain, especially at those places where there happen to be angles or corners in its courie. The only method of preventing this is by means of certain cavities disposed at proper diffances from one another. Into thefe the fediment will be collected, and they are for that reaton called fig. pools. With regard to thefe, the only direc-Sci-pools. tions recellary are, that they be placed at proper diflances, be sufficiently large, and placed so as to be eatily cleaned. It is a good rule to make a fefspool at

falling to the bettom will be very apt to choke up the

means a confid rable quantity of fediment will be prevented from entering the channel at all. Others are to be made at proper diffances, especially where there are any angles. They must be made fulficiently large; the bigger, in moderation, the better; and they mult also be covered in such a manner as to be easily got at

each place where the water enters the drain; as by this

in order to be cleaned. But as putrid water is exceedingly noxious, it will be necessary to carry up a brick funnel over every felapool, in order to prevent the collection of the putrid effluvia, which would otherwife occasion the death of the person who cleaned it.

All drains ought to be arched over at top, and may Proportion be most conveniently built of brick. According to of drains. their different fizes, the following proportions of height and thickness may be observed. If the drain is 18 inches wide, the height of the walls may be one foot, and their thickness 9 inches; the bottom may be paved with brick laid flatwife, and the arch turned 4 inches. If the drain is 22 inches wide, the fide walls are then to be one foot three inches in height, and the refl confiructed as before. If it is 14 inches wide, the leight of the walls may be 9 inches, and the sweep of the arch 4. A drain of a yard wide should have the

boggy managed.

Sandy or

radice. same height, and the arch turned over it ought to be o inches thick. Upon the same principles and proportions may other drains of any fize be constructed.

104 **mad**ation

The fewers and drains being constructed in a manner buildings proportioned to the fize of the intended building, the architect may next proceed to lay the foundation of the walls. Here the first care must be, that the floor of the foundation be perfectly smooth and level. The Italians begin with laying over it an even covering of strong oak plank; and upon that they lay, with the most exact care, the first course of the materials. Whether we take this method, or begin upon the naked floor, all must be laid with the most exact truth by rule and line. When the board plat is laid, a course of stone is the best first bed, and this is to be laid without mortar; for lime would make the wood decay, which otherwife, in a tolerably good foil, will last for ages. After this, all the courses should follow with the same perfect evennels and regularity. If the materials are brick, they should be laid on with an equal, and not too great quantity of mortar: if stone, they ought to be placed regularly, and in the fame fituation in which they lay in the quarry: for many stones which will bear any weight flatwife, and in their natural polition, are of fuch a grain, that they will split otherwise. The joinings of the under course must be covered by the folid of the next course all the way up; and the utmost care must be taken that there be no vacuity left in the wall, for the weight will most certainly crush it in. The less mortar there is in a foundation, the better. Its use is to cement the bricks and flones together; and the evener they are, the less will be required for that purpose. Where mortar is used to fill up cavities, it becomes part of the wall; and not being of equal strength with the folid materials, it takes from the firmness of the building. For the fame reason nothing can be more absurd than to fill up a foundation with loose stones or bricks thrown in at random; and where this is done, the ruin of the building is inevitable. Where the foundation of a principal wall is laid upon piles, it will be necessary also to pile the foundations of the partitions, though not fo strongly.

105 'hickness nd dimiutions of

The thickness of foundation walls in general ought to be double that of the walls which they are to support. The loofer the ground, the thicker the foundation wall ought to be; and it will require the same addition also in proportion of what is to be raised upon it. The plane of the ground must be perfectly level, that the weight may press equally everywhere: for when it inclines more to one fide than another, the wall will split. The foundations must diminish as they rise, but the perpendicular is to be exactly kept in the upper and lower parts of the wall; and this caution ought to be observed all the way up with the same strictness. In fome ground, the foundation may be arched; which will materials and labour, at the fame time that the Amperstructure has an equal security. This practice is peculiarly ferviceable where the foundation is piled.

As the foundation walls are to diminish in thickness, fo are those which are built upon them. This is necessary in order to save expence, but is not absolutely so to strengthen the wall; for this would be no less from though it was continued all the way to the tep of an application of an application was example. In this the ancients were very expert;

for we see, in the remains of their works, walls thus Practice: carried up to an exorbitant height. It is to be observed, however, that, belides perfect truth in their perpendiculars, they never grudged iron-work, which contributed greatly to the strength of their buildings. The thickness and diminution of walls is in a great measure arbitrary. In common houses built of brick, the general diminution from the bottom to the top is one half the thickness at the bottom; the beginning is two bricks, then a brick and a half, and laftly one brick, thickness. In larger edifices, the walls must be made proportionally thicker; but the diminution is preserved much in the same manner. Where stones are used regard must be had to their nature, and the propriety of their figures for holding one another. Where the wall is to be composed of two materials, as stone and brick, the heaviest ought always to be placed under-

There is one farther particular regarding the strength Angles how of a plain wall, and that is, the fortifying its angles. fortified. This is best done with good stone on each side, which gives not only a great deal of strength, but a great deal of beauty. Pilasters properly applied are a great strengthening to walls. Their best distance is about every 20 foot, and they should rife five or fix inches from the naked of the wall. A much flighter wall of brick with this assistance, is stronger than a heavier and massier one built plain. In brick walls of every kind, it is also a great addition to their strength to lay fome chief courses of a larger and harder matter; for these serve like sinews to keep all the rest firmly together, and are of great use where a wall happens to fink more on one side than another. As the openings in a Windows wall are all weakenings, and as the corners require to improper be the strongest parts, there should never be a window near the very near a corner. Properly, there should always be corners. the breadth of the opening firm to the corner. In the most perfect way of forming the diminution of walls, the middle of the thinnest part being directly over the middle of the thickest, the whole is of a pyramidal form; but where one fide of the wall must be per-

nice, which will at once be a strength and ornament. Along with the construction of walls, that of the Chimneys. chimneys must also be considered; for errors in the construction of these, will render the most elegant building extremely difagreeable. The common causes of fmoking are either that the wind is too much let in above at the mouth of the shaft, or the smoke is stifled below; and sometimes a higher building or a great elevation of the ground behind, is the fource of the mischief; or lastly, the room in which the chimney is may be so small or close, that there is not a sufficient current of air to drive up the smoke. Almost all that can be done, while the walls are constructing, to prevent smoke, is, to make the chimney vent narrower at bottom than at top: yet this must not be carried to an extreme; because the smoke will then linger in the upper part, and all the force of the draught will not be able to fend it up. As for the methods of curing fmoky chimneys in houses already built, fee the article CHIMNEY.

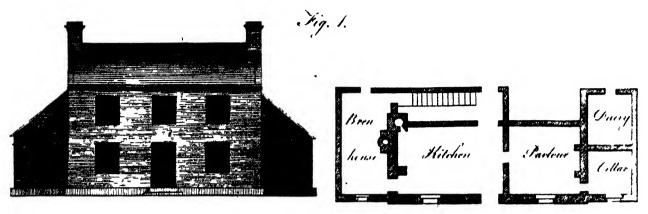

pendicular and plain, it ought to be the inner, for the

fake of the floors and crofs walls. The diminished

fide, in this case, may be covered with a fascia or cor-

ECTURE. RCHIT

116 Ruofs.

After the walls are finished, the roof is the next confideration: but concerning it very little can be faid; only that its weight must be proportioned to the strength of the walls. It must also be contrived so as to press equally upon the building; and the inner walls must bear their share of the load as well as the outer ones. A roof ought neither to be too masty nor too light; as being necessary for keeping the walls together by its pressure, which it is incapable of doing while too light; and if too heavy, it is in danger of throwing them down. Of these two extremes, however, the last is to be accounted the worst.

117 Pluora.

With regard to the floors, they are most commonly made of wood; in which case, it will be necessary that it should be well seasoned by being kept a considerable time before it is used. The floors of the same story should be all perfectly on a level: not even a threshold rising above the rest; and if in any part there is a room or closet whose floor is not perfectly level, it ought not to be left so, but raised to an equality with the rest; what is wanting of the true floor being supplied by a false one.

In mean houses, the floors may be made of clay, ox blood, and a moderate portion of sharp sand. These three ingredients, beaten thoroughly together and well spread, make a firm good floor, and of a beautiful colour. In elegant houses, the floors of this kind are made of plaster of Paris, beaten and fifted, and mixed with other ingredients. This may be coloured to any hue by the addition of proper substances; and, when well worked and laid, makes a very beautiful floor. Befides thefe, halls, and fome other ground rooms, are paved or floored with marble or stone; and this either plain or dotted, or of a variety of colours; but the universal practice of carpeting has, in a great measure fet afide the bestowing any ornamental workmanship upon floors. In country buildings, also, floors are frequently made of bricks and tiles. Thefe, according to their shapes, may be laid in a variety of figures; and they are also capable of some variation in colour, according to the nature of the earth from which they were made. They may be laid at any time; but for those of earth or platter, they are best made in the beginning of fummer, for the take of their drying.

CHAP. III. Of the distribution of the Apartments of Houses, with other conveniencies.

As houses are built only for the sake of their inhabitants, the distribution of the apartments must of neceffity be directed by the way of life in which the in-Plan of a habitants are engaged. In the country, this is com-Farmhouse mouly farming; and here, besides the house for the family, there is also necessary a barn for the reception of the produce of the ground, a stable for cattle, a cart house for keeping the utenfils under cover, and sheds for other uses.—To accomplish these purposes, let a piece of ground be taken of five times the extent of the front of the house, and enclosed in the least expensive manner. Back in the centre of this let the house be placed, and in the front of the ground the barn and the stable, with the adjoining sheds. These are to be fet one on each fide, to the extreme measure Vol. II. Part I.

of the enclosed ground; they will thus fill up a part of Practice the entrance, and will leave all about the house some enclosed ground by way of yard. From the barn to the stable may be extended a fence with a gate in the middle, and this gate ought to front the door of the house.

This much being fettled, the plan of the house and out buildings may be made as follows. The door may open into a plain brick passage, at the end of which may be carried up a small staircase. On one side of the passage may be a common kitchen; and on the other fide a better or larger room, which will ferve the family by way of parlour. Beyond this may stand on one fide the pantry, and on the other the dairy room, the last being twice the fize of the former. They are placed on the same side with the parlour, on account of the heat of the kitchen, which renders it improper to be near them. On the kitchen fide, a brewhouse may very conveniently be placed. More rooms may be added on the ground floor as occasion requires; and the upper flory is to be divided into bedchambers for the family, with garrets over them for the fervants .-A house of this kind is represented Plate XLIX. fig. 1.; and one of a fomewhat better kind, fig. 2. where a private gentleman who has a fmall family may find conveniency.

On plate L. is represented a gentleman's country- Of an elefeat, built on a more elegant plan. Here the front gant counmay extend 65 feet in length, the depth in the centry feat. tre being 40 feet, and in each of the wings 45. The offices may be disposed in wings; the kitchen in the one, and the stables in the other; both of which however, may correspond in their front with the rest of the building, which they ought also to do with one another. These wings may have a projection of 13 feet from the dwelling houle, to which they ought to be connected, not by thraight lines, but by curves as

represented fig. 2.

The best proportion of these offices to a house extending 65 feet in front, is 35 feet. If they are smaller, the house will look gigantic; if larger, they will lessen its aspect. To a front of 35 feet, a depth of 48 is a very good proportion. There ought also to be a covered communication between the dwelling house and offices, which must not appear only to be a plain blank wall, but must be ornamented with gates, as in the figure. The arch by which the offices are joined to the dwelling house must be proportioned to the extent of the buildings; and there cannot be a better proportion than five feet within the angles of the buildings. By this means the wings, which have only a projection of 19 feet, will appear to have one of 18, and the light will be agreeably broken.

With regard to the internal distribution of a house of this kind, the under story may be conveniently divided into three rooms. The hall, which is in the centre will occupy the whole of the projecting part, having a room on each fide. The length of the half must be 24 feet and its breadth 12: the rooms on each fide of it must be 16 feet long, and 11 wide. Of these two front rooms, that on the right hand may be conveniently made a waiting room for persons of better rank, and that on the left hand a refling room

Practice. for the master of the house. Behind the hall may run a passage of four feet and a half, leading to the apartments in the hinder part of the house and the staircase. These may be disposed as follows: Directly behind the hall and this passage the space may be occupied by a faloon, whose length is 24 feet and its breadth 17. On the left hand of the passage, behind the hall, is to be placed the grand staircase; and as it will not fill the whole depth, a pleafant common parlour may terminate on that fide of the house. On the other fide, the passage is to lead to the door of the great dining parlour, which may occupy the whole space.

110 Another.

121 Of the

earl of

house.

A plan of a house of the same kind, but somewhat different in the distribution, is represented below in the same plate. The front here extends 68 feet, and the wings project 28 feet; their depth is 48, and their breadth 36. The hall may be 26 feet long and 17 broad. On the left hand of the hall may be a waiting room 16 feet long and 10 broad; behind which may be a handionie dining room. The passage into this waiting room should be at the lower end of the hall; and it must have another opening into the room behind it. On the right hand of the hall is the place of the great flaurcale, for which a breadth of 16 feet three inches is to be allowed. In the centre of the building, behind the hall, may be a drawing room 26 feet long and 16 broad; and behind the staircase will be room for a common parlour of 16 feet square. The passage of communication between the house and wings may be formed into colonnades in a cheap manner behind: a flight of steps, raifed with a sweep, occupying the centre of each, and leading up to a door, and the covering being no more than a fled supported by the plainest and cheapest columns.

The two wings now remain to be disposed of. That on the right hand may contain the kitchen, and offices belonging to it, and the other the stables. The front of the right hand wing may be occupied by a kitchen entirely, which will then be 30 feet long and 161 wide; or it may be made smaller by setting off a fmall room to the right. Twenty-two feet by 16 will then be a good bignefs. The other room will then have the same depth of 16 feet, and the width to the front may be 7!. Beyond the kitchen may stand the flaircase, for which 71 feet will be a proper allowance; and to the right of this may be a scullery 12 feet 10 inches deep from the back front by 7 in breadth. the left of the stair may be a servants hall 16 feet square, and behind that a larder 12 feet 10 by 14 feet 6. In the centre of the other wing may be a double coachhouse: for which there should be allowed the whole breadth of the wing, with 10 feet 6 inches in the clear; and on each fide of this may be the stables. The external decorations of the front and wings will be better understood from the figure than they can be by any description.

Plate LI. shows the plan and elevation of the house of the earl of Wemyss at Newmills. The propor-Wemyfe's tions of the rooms are marked in the plan; and the front, being decorated with columns of the Ionic order, will fufficiently show in what manner any of the five orders may be induced with propriety and elegance.

CHAP. IV. Of Aquatic Buildings.

1. Of BRIDGES.

THESE are constructed either of wood or stone; of which the last are evidently the strongest and most durable, and therefore, in all cases to be preferred where the expence of erecting them can be borne. The proper situation for them is easily known, and requires no explanation; the only thing to be observed is, to make them cross the stream at right angles, for the sake of boats that pass through the arches, with the current of the river; and to prevent the continual striking of the stream against the piers, which in a long course may endanger their being damaged and destroyed in the end.

Bridges built for a communication of high roads, ought to be so strong and substantial as to be proof against all accidents that may happen, to have a free entrance for carriages, afford an easy passage to the waters, and be properly adapted for navigation, if the river admits of it. Therefore the bridge ought to be at least as long as the river is wide in the time of its greatest flood: because the stopping of the waters above may cause too great a fall, which may prove dangerous to the veffels, and occasion the under gravelling the foundation of the piers and abutments; or, by reducing the passage of the water too much in time of a great flood, it might break through the banks of the river, and overflow the adjacent country, which would cause very great damages; or if this should not happen, the water might rife above the arches, and endanger the bridge to be overfet, as has happened in

When the length of the bridge is equal to the breadth of the river, which is commonly the cafe, the current is lessened by the space taken up by the piers; for which reason this thickness should be no more than is necessary to support the arches; and it depends, as well as that of the abutments, on the width of the arches, their thickness, and the height of the piers.

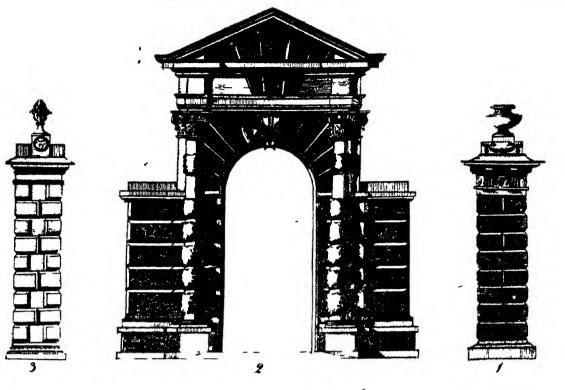

The form of the arch is commonly semicircular; but Proper when they are of any great width, they are made ellip-form of tical, because they would otherwise become too high, arches. This has been done at the Pont Royal at Paris, where the middle arch is 75 feet, and is height would have been 37.5 feet, insteed of which it is only 24 by being made elliptical.

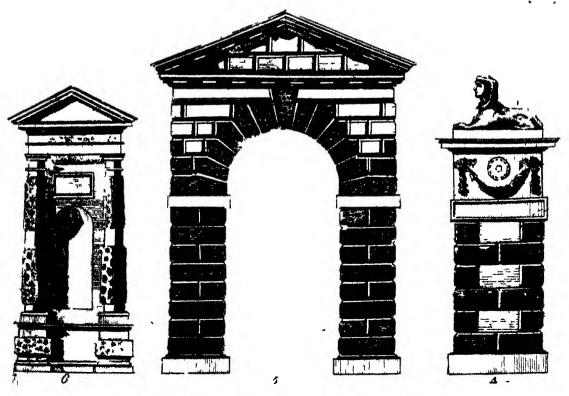

Another advantage of much more importance arises from the oval figure, which is, that the quantity of mafonry of the arches is reduced in the fame proportion as the radius of the arch is to its height. That is, if the radius is 36 feet, and the height of the arch 24, or three-fourths of the radius, the quantity of malonry of the arches is likewife reduced to three-fourths; which must lessen the expence of the bridge considerably. Notwithstanding these advantages, however, the latest experiments have determined fegments of circles to be preferable to curves of any other kind; and of these the semicircle is undoubtedly the best, as pressing most perpendicularly on the piers.

When the height of the piers is about fix feet, and the arches are circular, experience has shown, says Mr

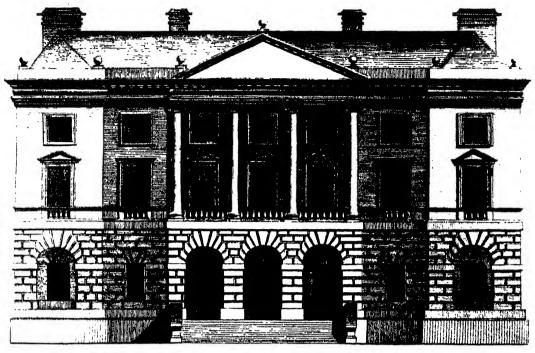

Belidor.

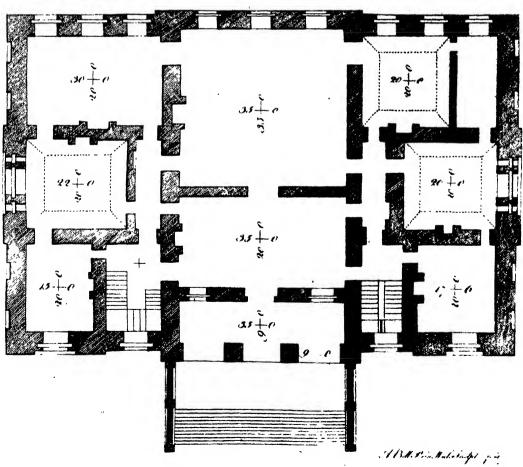

ARCHITECTURE.

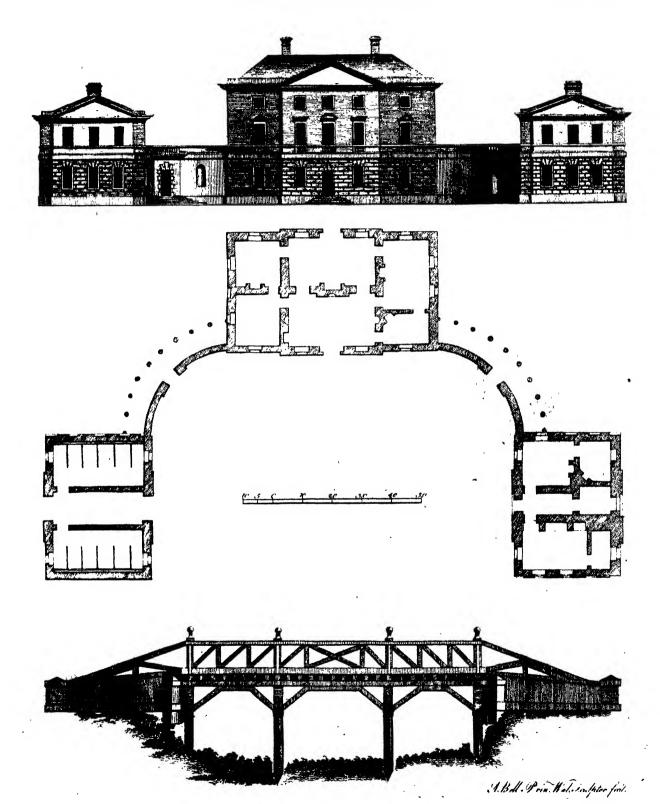

Defigns for Gates & Pears.

Practice. Belidor, that it is sufficient to make the thickness of the piers the fixth part of the width of the arch, and two feet more; that is, the thickness of the piers of an arch of 36 feet, ought to be 8 feet; those of an arch of 48 feet, to be 10.

124

125

When the arches are of a great width, the thickness of the piers of the piers may be reduced to the fixth part of that width; but the depression of the two feet is not done at once; that is, in an arch of above 48 feet, 3 inches are taken off for every 6 feet of increase of the width of the arch. For instance, the thickness of the piers supporting an arch of 72 feet wide, should be 14 fect, according to the preceding rule; but by taking off 3 inches for every 6 feet, above an arch of 48 wide, the thickness of the piers is reduced to 13 feet; consequently, by following the same rule, the thickness of the piers supporting an arch of 16 fathoms wide, will be 16 feet; all the others above that width are the fixth part of the width.

After this, Mr Belidor gives a rule for finding the thickness of the piers which support elliptic arches, and makes them stronger than the former; the abutments he makes one fixth part more than the piers of the largest arch. But it is plain that these rules are insufficient, being merely guess-work, determined from some works

that have been executed.

The thickness of the arch-stones is not to be deter-Of the archmined by theory, nor do those authors who have written on the subject agree amongst themselves. Mr Gautier, an experienced engineer, in his works, makes the length of the arch-stones, of an arch 24 feet wide, two feet; of an arch 45, 60, 75, 90 wide, to be 3, 4, 5, 6, feet long respectively, when they are hard and durable, and fomething longer when they are of a foft nature: on the contrary, Mr Belidor fays, they ought to be always one twenty-fourth part of the width of the arch, whether the stone be hard or foft; because, if they are foft, they weigh not fo much.

But that the length of the arch-stones should be but a foot in an arch of 24 feet wide, 2, 3, 4, in arches of 48, 72, 96 fect, seems incredible; because the great weight of the arches would crush them to pieces, by the pressure against one another; and therefore Mr Gautier's rule appears preferable; as he made the length of the arch-stones to increase in a slower proportion, from 10 to 45 feet wide, than in those above that width, we imagine that the latter will be sufficient for all widths, whether they are great or little; therefore we shall suppose the length of the arch-stones of 30 feet in width to be two feet, and to increase one foot in 15; that is, 3 feet in an arch of 45 feet; 4, 5, 6, in an arch of 60, 75, and 90 feet; and fo the rest in the same proportion.

Table containing the thickness of piers of bridges.

	6	9	12	15	18	21	24
20	4-574	4.918	5.165	5.350	5-492	5.610	5.693

70	13.114	13.869	14 517	15.049	15.573	16011	16.400
75	14.000	14.705	15.336	15.965	16.480	10.940	17.354
80	14.747	15.542	16.234	16.842	17.381	17 864	18.298
85	15.513	16 328	17.041	17.674	18.237	18.742	19 198
90	16 373	17.201	17929	18.578	19.157	19.679	20-152
95	17.184	17.826	18.772	19.438	20.036	20.577	21.068
100	17.991	ι8.848	19,610	20.293	20.90	21.466	21.976

The first horizontal line expresses the height of the Explana. piers in feet, from 6 to 24 feet, each increasing by 3; tion of the the first vertical column, the width of arches from 20 table. to 100 feet, for every five feet.

The other columns express the thickness of piers in feet and decimals, according to the respective height at the head of the column, and the width of the arch against it in the first column.

Thus, for example, let the width of the arch be 60 feet, and the height of the piers 12; then the number 12.718, under 12, and against 60, expresses the thickness of the piers, that is 12 feet and 8.6 inches: we must observe again, that the length of the key-stone is 2 feet in an arch of 30 feet wide; 3, 4, 5, 6, in an arch of 45, 60, 75, 90; that of 20 feet wide, I foot 4 mehes; and the length of any other width is found by adding 4 inches for every 5 feet in width.

As this table contains the thicknesses of piers in refpest to arches that are commonly used in practice, we imagined, that to carry it farther would be needlefs; because the difference between the thickness of the piers of any contiguous arches being but small, those between any two marked here, may be made equal to half the fum of the next below and above it: thus the thickness of the piers of an arch 52 or 53 feet wide is nearly equal to 10.222, half the fum of the thickneffes 9.085 and 10.64 of the arches 50 and 55 feet wide, when the height of the piers is 6 feet.

Rectangular piers are seldom used but in bridges o- Form of ver small rivers. In all others, they project the bridge piers. by a triangular prism, which presents an edge to the Ji 2

Practice. Argam, in order to divide the water more easily, and to prevent the ice from sheltering there, as well as vessels from running foul against them: that edge is terminated by the adjacent furfaces at right angles to each other at Westminster bridge, and make an acute angle at the Pont Royal of about 60 degrees; but of late the French terminate this angle by two cylindric furfaces, whose bases are arcs of 60 degrees, in all their new bridges.

128 Slope of the bridge on

When the banks of the rivers are pretty high, the bridge is made quite level above, and all the arches of an equal width; but where they are low, or for the fake of navigation, a large arch is made in the middle of the ftream, then the bridge is made higher in the middle than at the ends: in this case, the slope must be made eafy and gradual on both fides, fo as to form above one continued curve line, otherwise it appears disagreeable to the eye. Mr Behdor will have the descent of that flope to be one-twenty-fourth part of the length; but this is undoubtedly too much, as one-liftieth part of the length is quite sufficient for the descent.

Width, &c.

The width commonly allowed to small bridges is 30 feet: but in large ones near great towns, these 30 feet are allowed clear for horses and carriages, besides a banquet at each fide for foot puffengers of 6 to 9 feet each, raifed about a foot above the common road; the parapet walls on each fide are about 18 inches thick, and 4 feet high; they generally project the bridge with a cornish underneath: sometimes ballustrades of stone or iron are placed upon the parapet, as at Westminster; but this is only practifed where a bridge of a great length is made near the capital of a country.

The ends of bridges open from the middle of the two large arches with two wings, making an angle of 45 degrees with the reft, in order to make their entrance more free and easy: these wings are supported by the fame arches of the bridge next to them, being continued in the manner of an arch, of which one pier is

much longer than the other.

How the work is to be carried on.

As the laying the foundation of the piers is the most laying the difficult part of the whole work, it is necessary we should foundation. begin with an eafy case, that is, when the depth of the water does not exceed 6 or 8 feet; and then proceed to those which may happen in a greater depth of water.

TRE By batardeaus.

One of the abutments, with the adjacent piers, is enclosed by a dyke called batardeau by the French, of a fufficient width for the work, and room for the worknien. This batardeau is made by driving a double row of piles, whose distance is equal to the depth of water, and the piles in each row are 3 feet from each other: they are failened together on the outfide by bonds of 6 by 4 inches: this being done, frames of about 9 feet wide are placed on the infide to receive the boards which are to form the enclosure: the two uprights of these frames are two boards of an inch and a half thick, sharpened below to be driven into the ground, and fastened together by double bonds, one below and the other above, each separated by the thickness of the uprights; these bonds serve to slide the boards between: after these frames have been driven into the ground as hard as can be, then the boards themselves are likewise driven in till they reach the firm ground underneath.

Between every two piles tie-beams are fastened to the

bonds of the piles, to fasten the infide wall to the outside Practice. one; these tie-beams are let into the bonds and bolted to the adjacent piles: this being done, the bottom is cleared from the loofe fand and gravel, by a machine like those assed by ballast-heavers; and then well prepared clay is rammed into this coffer very tight and firm, to prevent the water from oozing through.

Sometimes these enclosures are made with piles only driven close to each other; at others, the piles are notched or dove-tailed one into the other; but the most usual method is to drive piles with grooves in them, 5 or 6 feet diffant from each other, and boards are let down between them.

This being done, pumps and other engines are used to draw the water out of the enclosures, so as to be quite dry; then the foundation is dug, and the stones are laid with the usual precautions, observing to keep fome of the engines always standing, in order to draw out the water that may ooze through the batardeau.

The foundation being cleared, and every thing ready to begin the work, a course of stones is laid; the outside all round with the largest stretchers and headers that can be had, and the infide filled with ashlers well jointed, the whole laid in terrals mortar: the facings are crampt together, and fet in lead; and fome cramps are alfo used to fasten the facings with the inside. The same manner is to be observed throughout all the courses to the height of low water mark; after which the facings alone are laid in terrals mortar, and the infide with the best of the common fort. When the foundation is carried to the height of low water mark, or to the height where the arches begin, then the shaft or middle wall is to be carried up nearly to the height of the arches, and there left standing till all the piers are sinished, in order that the malonry may be fufficiently dry and fettled before the arches are begun.

As the piers end generally with an arch at each end, Proper it is customary to lay the foundation in the same man-form of the ner: which is not fo well as to continue the base rect-base. angular quite to the ends of the piers, and as high as low water mark; both because the foundation becomes then so much broader, and also because the water will not be able to get under it: for when the current fets against a flat surface, it drives the sand and mud against it so as to cover it entirely; whereas if a sharp edge be presented to the stream, it carries every thing away, and exposes the foundation to the continual action of the water, which in course of time must destroy it.

After the intervals between the arches are filled up with stones laid in a regular manner without mortar, and the gravel is laid over them; two drains or gutters are to be made lengthwife over the bridge, one on each fide next to the foot-path, about fix feet wide and a foot deep; which being filled with fmall pebble ftones, ferve to carry off the rain water that falls on the bridge, and to prevent its filtering through the joints of the arches, as often happens.

The former method of laying the foundation by Method of means of batardeaus is very expensive, and often meets building with great difficulties: for when the depth of water is with coffers, 8 feet or more, it is scarcely possible to make the ba-as was practardeaus fo tight as to prevent the water from oozing Westminthrough them; and in that case the number of engines ster bridge, required, as well as the hands to work them, become very extensive; and if part of the batardeau should

(break

Practice. break by fome extraordinary wind or tide, the workmen would be exposed to very great danger.

> The next and best method therefore is to build with coffers, when it is practicable, fuch as were used at Westminster bridge. Here the height of water was 6 feet at a medium when lowest, and the tide rose about 10 feet at a medium also: so that the greatest depth of water was about 16 feet. At the place where one of the piers of the middle or great arch was to be, the workmen began to drive piles of about 13 or 14 inches square, and 34 feet long, shod with iron, so as to enter into the gravel with more eafe, and hooped above to prevent their splitting in driving them : these piles were driven as deep as could be done, which was 13 or 14 feet below the furface of the bed of the river, and 7 feet diffant from each other, parallel to the short ends of the pier, and at about 30 feet distant from them: the number of these piles was 34, and their intent to prevent any vessels or harges from approaching the work; and in order to hinder boats from passing between them, booms were placed so as to rife and fall with the water.

> This being done, the ballast-men began to dig the foundation under the water of about 6 feet deep, and 5 wider all round than the intended coffer was to be, with an easy slope to prevent the ground from falling in: in order to prevent the current from washing the fand into the pit, short grooved piles were driven before the two ends and part of the fides, not above 4 feet higher than low water mark, and about 15 feet distant from the coffer: between these piles rows of boards were let into the grooves down to the bed of the river, and fixed there.

> The bottom of the coffer was made of a strong grate, confitting of two rows of large timbers, the one longways, and the other croffways, bolted together with wooden trunnels ten feet wider than the intended foundation. The fides of the coffer were made with fir timhers laid horizontally close one overanother, pinned with caken truunels, and framed together at the corners, excepting at the two faliant angles, where they were secured with proper irons, so that the one half might be loofened from the other if it should be thought neceffary; these sides were lined on the inside as well as on the outfide with three inch planks placed vertically; the thickness of those sides was 18 inches at the bottom, reduced to 15 above, and they were 16 feet high; befides, knee timbers were bolted at the angles, in order to secure them in the strongest manner. The sides were fastened to the bottom by 28 pieces of timber on the outfide, and 18 within, called fraps, about 8 inches broad, and 3 or 4 inches thick, reaching and lapping over the ends of the fides: the lower part of thefe ftraps had one fide cut dove-tail fashion, in order to fit the mortifes made near the edge of the bottom to receive them, and were kept in their places by iron wedges; which being drawn out when the fides were to be taken away, gave liberty to clear the straps from the mortises.

> Before the coffer was launched, the foundation was examined, in order to know whether it was level; for which purpose several gauges were made, each of which confished of a stone of about 15 inches square and three thick, with a wooden pole in the middle of about 18 feet lofg. The foundation being levelled and the cof-

fer fixed directly over the place with cables fastened to Practice. tla adjacent piles the majons laid the first course of the stones for the foundation within it; which being sinished, a sluice made in the side was opened near the time of low water; on which the coffer funk to the bottom; and if it did not fet level, the fluice was shut, and the water pumped out, so as to make it float till fuch time as the foundation was levelled: then the mafons crampt the stones of the first course, and laid a second; which being likewise crampt, a third course was laid: then the fluice being opened again, proper care was taken that the coffer should settle in its due place. The stone work being thus raised to within two feet of the common low water mark, about two hours before low water the fluice was flut, and the water pumped out fo far as that the masons could lay the next course of stone, which they continued to do till the water was rifen fo high as to make it unfafe to proceed any further: then they left off the work, and opened the fluice to let in the water. Thus they continued to work night and day at low water till they had carried their work fome feet higher than the low water mark: after this, the fides of the coffer were loofened from the bottom, which made them float; and then were carried ashore to be fixed to another bottom, in order to serve for the next pier.

It must be observed, that the coffer being no higher than 16 feet, which is equal to the greatest depth of water, and the foundation being 6 feet under the bed of the river; the coffer was therefore 6 feet under water when the tide was in; but being loaded with three courses of stones, and well secured with ropes fastened to the piles, it could not move from its place. By making it no higher, much labour and expence were faved; yet it aniwered the intent full as well as if it had been high enough to reach above the highest stood.

The pier being thus carried on above low water mark, the masons simshed the rest of it during the intervals of the tides in the usual way; and after all the piers and abutments were finished in a like manner, the arches were begun and completed as mentioned before: the whole bridge was built in about feven years, without any accidents happening either in the work or to the workmen, which is feldom the case in works of this nature.

It may be observed, that all the piers were built Materials with folid Portland flone, fome of which weighed four employed tons. The arch flones were likewife of the fame fort : but the rest of the masonry was finished with Kentish rag-flones; and the paths for foot paffengers were paved with purbec, which is the hardest stone to be had in England, excepting Plymouth marble.

This method of building bridges is certainly the ca-This mefielt and cheapest that can be thought of, but cannot thed somebe used in many cases: when the foundation is so bad times inas not to be depended upon without being piled, or the practicable, depth of water is very great, with a flrong current and no tide, it cannot then be practifed. For if piles are to be ased, it will be next to impetible to cut them off in the same level five or six feet below the bed of the river, notwithstanding that fiws have been invented for that purpose: because if they are cut off separately, it will be a hard matter to do it so nicely that the one shall not exceed the other in height; and if this is not done, the grating or bottom of the coffer will not be equally. fapported,

thad.

Practice.

Practice supported, whereby the foundation becomes precarious: neither can they be cut off altogether; for piles are to be driven as far as the bottom of the coffer extends, which at Westmiaster bridge was 27 feet; the faw must have three feet play, which makes the total length of the faw 30 feet; now, if either the water is deeper than it is there, or the arches are wider, the faw must still be longer so that this method is impracticable in any fuch cases.

> In a great depth of water that has a strong current and no tide, the coffers must reach above the water, which makes them very expensive, and unwieldy to manage, as well as very difficult to be fecured in their places, and kept fleady; fo that there is no probabi-

lity of using them in such a case.

In some cases, when there is a great depth of water, Rullian meand the bed of the river is tolerably level, or where it can be made to by any contrivance, a very strong frame of timber about four times as large as the base of the piers may be let down with stones upon it round the edges to make it fink : after fixing it level, piles must be driven about it to keep it in its place; and then the foundation may be laid in coffers as before, which are to be kept fleady by means of ropes tied to the piles.

This method has frequently been used in Russia; and though the bed of the river is not very folid, yet fuch a grate, when once well fettled with the weight of the pier upon it, will be as firm as if piles had been driven under the foundation; but to prevent the water from gulling under the foundation, and to fecure it against all accidents, a row of dove-tail piles must be driven quite round the grating: this precaution being taken, the foundation will be as secure as any that can be made.

The French engineers make use of another method French mein raising the foundations of masonry under water; which is, to drive a row of piles round the intended place, nearer to, or farther from, each other, according as the water is more deep or shallow: these piles being through bound together in feveral places with horizontal tie-beams, ferve to support a row of dovetail piles driven within them: when this is done, and all well fecured according to the nature of the fituation, and circumstances, they dig the foundation by means of a machine with scoops, invented for that purpole, until they come to a folid bed of gravel or clay; or if the bed of the river is of a fost consistence to a great depth, it is dug only to about fix feet, and a grate of timber is laid upon it, which is well fecured with piles driven into the opposite corners of each square, not minding whether they exceed the upper furface of the grate much or little.

When the foundation is thus prepared, they make a kind of mortar called beton, which confilts of twelve parts of pozolano or Dutch terrals, fix of good fand, nine of unflaked lime, the best that can be had, thirteen of stone splinters not exceeding the bigness of an egg, and three parts of tile dust, or cinders, or else scales of iron out of a forge: this being well worked together must be left standing for about 24 hours, or till it becomes so hard as not to be separated without a pick axe.

This mortar being thus prepared, they throw into the coffer a bed of ruble stone, not very large, and spread them all over the bottom as nearly level as they can; then they fink a box full of this hard mortar, broken into pieces, till it come within a little of the bottom; the box is fo contrived as to be overfet or turned upfide down at any depth; which being done, the pieces of mortar foften, and so fill up the vacant spaces between the stones; by these means they fink as much of it as will form a bed of about 12 inches deep all over: then they throw in another bed of stone, and continue alternately to throw one of mortar and one of stone till the work approaches near the surface of the water where it is levelled, and then the rest is finished with stones in the usual manner.

Mr Belidor fays, in the fecond part of his Hydraulics, Vol. II. p. 188, that Mr Millet de Montville having filled a coffer containing 27 cubic feet, with mafonry made of this mortar, and funk it into the sea, it was there left standing for two months, and when it was taken out again it was harder than stone itself.

We have hitherto mentioned fuch fituations only Impossibiliwhere the ground is of a foft nature: but where it is ty of buildrocky and uneven, all the former methods prove inef ing bridges fectual; nor indeed has there yet been any one propof-cases. ed which can be always used upon such occasions, especially in a great depth of water. When the water is not fo deep but that the unevenness of the rock can be perceived by the eye, piles strongly shod with iron may be raifed and let fall down, by means of a machine, upon the higher parts, so as to break them off piece by piece, till the foundation is tolerably even, especially when the rock is not very hard; which being done either this or any other way that can be thought of, a coffer is made without any bottom, which is let down and well fecured, so as not to move from its place: to make it fink, heavy stones should be fixed on the outfide; then strong mortar and stones must be thrown into it; and if the foundation is once brought to a level, large hewn stones may be let down so as to lie flat and even: by these means the work may be carried on quite up to the surface of the water. But when the water is so deep, or the rock so hard as not to be levelled, the foundation must be sounded, so as to get nearly the rifings and fallings; then the lower part of the coffer must be cut nearly in the same manner, and the rest finished as before. It must however be obferved, that we suppose a possibility of finking a coffer; but where this cannot be done, no method that we know of will answer.

Among the aquatic buildings of the ancients none Trajan's appears to have been more magnificent than Trajan's bridge over bridge. Dion Cassius gives the following account of the Danuber it: " Trajan built a bridge over the Danube, which described. in truth one cannot sufficiently admire; for though all the works of Trajan are yery magnificent, yet this far ekceeds all the others: the piers were 20 in number, of square stone: each of them 150 feet high above the foundation, 60 feet in breadth, and distant from one another 170 feet. Though the expence of this work must have been exceeding great, yet it becomes more extraordinary by the river's being very rapid, and its bottom of a fost nature: where the bridge was built, was the narrowest part of the river thereabout, for in most others it is double or treble this breadth; and although on this account it became so much the deeper and the more rigid, yet no other place was for suitable for this undertaking. The arches were afterwards

goken

Practice. broken down by Adrian; but the piers are still remaining, which feem as it were to testify that there is nothing which human ingenuity is not able to effect." The whole length then of this bridge was 1500 yards; fome authors add, that it was built in one summer, and that Apollodorus of Damascus was the architect, who left behind him a description of this great work.

140 Wooden bridges.

Where slone bridges cannot be erected on account of the expence, very strong and durable ones may be constructed of wood: in which case they ought to be so framed, as that all the parts may press upon one another like the arch of a stone bridge; and thus, inflead of being weakened by great weights passing over them, they will become the stronger. How this is to be accomplished, will be better understood from the figure at bottom of Plate L. which represents a wooden bridge constructed after this manner, than it can be by any description.

2. Of HARBOURS.

Situation harbours.

In these, the first thing to be considered is the fituproper for ation; which may be some large creek or bason of water, in or near the place where the harbour is intended to be made, or at the entrance of a large river, or near the fea: for a harbour should never be dug entirely out of dry land, unless upon some extraordinary occasions, where it is impossible to do otherwise, and yet a harbour is absolutely necessary. When a proper place is found, before it is fixed upon, it must be considered whether thips can lie there fafe in flormy weather, cspecially when those winds blow which are most dangerous upon that coast; whether there be any hills, rising ground or high buildings, that will cover it; in thefe cases, the situation is very proper: but if there be nothing already that will cover the flups, it must be observed whether any covering can be made at a moderate expence, otherwise it would be useless to build a harbour there.

> The next thing to be confidered is, whether there be a sufficient depth of water for large ships to enter with fafety, and lie there without touching the ground; and if not, whether the entrance and infide might not be made deeper at a moderate, expence : or, in case a fufficient depth of water is not to be had for large ships, whether the harbour would not be useful for small merchantmen; for such a one is often of great advantage, when fituated upon a coast much frequented by fmall coasting vessels.

The form of the harbour must be determined in such a manner, that the ships which come in when it is flormy weather may lie safe, and so as there may be fufficient room for as many as pals that way; the depths of water where the piers are to be built must be taken at every 10, 15, or 20 feet distance, and marked upon piles driven here and there, in order that the workmen may be directed in laying the found-

142

Materials.

This being done, it must be considered what kind of materials are to be used, whether stone, brick, or wood. When stones are to be had at a moderate price, they ought to be preferred, because the work will be much stronger, more lasting, and need fewer repairs, than if made with any other materials: but when ilones are scarce, and the expence becomes greater than what is allowed for building the harbour, the foundation may be made of stone as high as low water mark, and the Practice. rest finished with brick. If this manner of building should still be too expensive, wood must be used; that is, piles are driven as close as is thought necessary; which being fastened together by cross bars, and covered with strong oaken planks, form a kind of coffer, which is filled with all kinds of stones, chalk, and

The manner of laying the foundation in different French me depths of water, and in various foils, requires particu-thod or building. lar methods to be followed. When the water is very deep, the French throw in a great quantity of stones at random, so as to form a much larger hase than would be required upon dry land; this they continue to within 3 or 4 feet of the furface of the water, where they lay the stones in a regular manner, till the foundation is raifed above the water: they then lay a great weight of stones upon it, and let it stand during the winter to fettle; as likewife to fee whether it is firm, and refifts the force of the waves and winds: after that, they finish the superstructure with large stones in the usual

As this method requires a great quantity of stones, A preferit can be practifed only in places where flones are in able one. plenty; and therefore the following one is much preferable. A coffer is made with dove-tail piles of about 30 yards long, and as wide as the thickness of the foundation is to be; then the ground is dug and levelled, and the wall is built with the belt mortar.

As foon as the mortar is tolerably dry, those piles at the end of the wall are drawn out, the fide rows are continued to about 30 yards farther, and the end enclosed; then the foundation is cleared, and the stones laid as before. But it must be observed, that the end of the foundation finished is left rough, in order that the part next to it may incorporate with it in a proper manner; but if it is not very dry, it will incline that way of itfelf, and bind with the mortar that is thrown in next to it: this method is continued till the whole pier is entirely finished.

It must likewise be observed, that the piers are not made of one continued folid wall; because in deep water it would be too expensive: for which reason, two walls are built parallel to each other, and the interval between them is filled up with flringle, chalk, and flone. As these walls are in danger of being thrust out or overfet by the corps in the middle, together with the great weight laid at times on the pier, they are tied or bound together by crofs walls at every 30 or 40 yards distance, by which they support each other in a firm and itrong manner.

In a country where there is a great plenty of stones, piles may be driven in as deep as they will go, at about two or three feet distance; and when the foundation is funk and levelled, large stones may be let down, which will bed themselves: but care must be taken to lay them close, and so as to have no two joints over each other; and when the wall is come within reach, the stones must be crampt together.

Another method practifed is to build in coffers much Another after the fame manner as has been done in building the method piers of Westminster bridge; but as in this case the with coffers ends of the coffers are left in the wall, and prevent their joining so well as to be water tight, the water that penetrates through and enters into the corps may occa-

Practice. fion the wall to burst and to tumble down. Another inconveniency arising from this manner of building is, that as there are but few places without worms, which will deftroy wood wherever they can find it; by their means the water is let into the pier, and confequently makes the work liable to the fame accident as has been mentioned above.

146 Ruffian method.

To prevent these inconveniencies, the best method is to take the wood away, and joggle the ends of the walls together with large stones, pouring terrals mortar into the joints; when this is done, the water between the two walls may be pumped out, and the void space filled up with stone and shingle as usual; or if these joggles cannot be made water tight, some dove-tail piles must be driven at each end as close to the wall as can be done, and a strong fail cloth put on the outside of them, which, when the water is pumped out, will flick so close to the piles and wall, that no water can come in. This method is commonly used in Russia.

Thickness. of piers.

The thickness of a pier depends on two considerations: it ought to be both such as may be able to resist the shock of the waves in stormy weather; and also to be of a sufficient breadth above, that ships may be laden or unladen whenever it is thought necessary. Now, because the specific gravity of sea water is about one half that of brick, and as 2 to 5 in comparison of stone; and fince the pressure of stagnated water against any furface is equal to the weight of a prism of water whose altitude is the length of that furface, and whose base is a right angled isosceles triangle, each of the equal sides being equal to the depth of the water; therefore a pier built with bricks, whose thickness is equal to the depth of the water, will weigh about four times as much as the pressure of the water against it; and one of stone of the same breadth, about fix times and a quarter as much. Now this is not the force to be confidered, fince this pressure is the same within as without the pier: but it is that force with which the waves strike against the piers, and that depends on the weight and velocity of the waves, which can hardly be determined; because they vary according to the different depths of water, the distance from the shore, and according to the tides, winds, and other causes. Consequently the proper thickness of the piers cannot be determined by any other means than by experience.

Practitioners suppose, that if the thickness of a pier Practice. is equal to the depth of the water, it is sufficient; but for a greater security they allow 2, 3, or 4 feet more. This might probably do, if piers were built with folid stones crampt together; but as this is hardly ever the cafe, and on the contrary, as the infide is filled up with shingle, chalk, or other loose materials, their rule is not to be depended upon; besides it makes the space above too narrow for lading and unlading the ships, unless in a great depth of water; so that it does not appear that their method can be followed, excepting in a very few cases where the water has but very little motion.

When stone can be had, no other materials should be used, because they being of a larger bulk than brick, will better relift the waves by their own weight, till fuch time as the mortar is grown hard; for after this is effected, brick will relift better against the action of fea water than foft stones.

The wall must be built with terrass mortar from the bottom to the height of low water mark, and the reft finished with cinder or tile-dust mortar, which has been found fufficiently good in those places where the wall is wet and dry alternately. The upper part of the pier should be paved with flat hewn stones laid in strong mortar, in order to prevent any water from penetrating into it: iron rings ought also to be fixed here and there at proper distances, to fasten the ships, and prevent them from striking against the pier when agitated by the waves.

Wooden fenders or piles should be driven at the infide close to the wall, and crampt to it with iron, to prevent the ships from touching them, and from being worn by the continual motion. Where the fea breaks against the piers with great violence, breakers should be made at proper diffances; that is, two rows of piles are driven nearly at right angles to the piers for the length of about 12 or 15 feet, and at about 8 or 10 feet distant from each other; and then another to join the two former: these piles being covered with planks, and the infide being filled with thingle and ruble stones, then the top is paved with stones of about a foot in length, fet longwise to prevent the waves from tearing them up. This precaution is absolutely necessary where the water rushes in very strongly.

Archons.

Archivist &c. The archives of ancient Rome were in the temple of Saturn; the archives of the court of chancery are in the rolls office.

> ARCHIVIST, ARCHIVISTA, a keeper of an archive.

> Under the emperors, the archivist was an officer of great dignity, held equal to the proconfuls, vefted with the quality of a count, flyled clarifimus, and exempted from all public offices and taxes. Among the ancient Greeks and Perfians, the trult was committed to none but men of the first rank; among the Franks, the clergy being the only men of letters, kept the office among themselves .- Since the erection of the electoral college, the archbishop of Mentz has had the direction of the archives of the empire.

> ARCHMARSHAL, the grand marshal of the empire, a dignity belonging to the elector of Saxony.

ARCHONS, in Grecian antiquity, were magistrates * See the appointed after the death of Codrus *. They were choarticle Atte- fen from the most illustrious families till the time of Ariflides, who got a law paffed, by which it was enacted, that, in electing thefe magillrates, lefs regard should be paid to birth than to merit.

The tribunal of the archors was composed of nine officers. The first was properly the archon; by whose name the year of his administration was distinguished. The title of the fecond was king; that of the third, polemarchus: to these were added six thesmothete. These magistrates, elected by the scrutiny of beans, were obliged to prove, before their respective tribes, that they had forung, both in their father's and their mother's fide, for three descents, from citizens of Athens. They were likewife to prove that they were attached to the worship of Apollo, the tutelary god of their country; that they had in their house an altar confecrated to Apollo; and that they had been respecifully obedient to their parents; an important and facted part of their character, which promifed that they would be faithful fervants to their country. They were likewife to prove, that they had ferved in a military capacity the number of years which the republic required of every citizen; and this qualification gave the flate experienced officers; for they were not allowed to quit the army till they were 40 years old. Their fortune too, of which they were to inform those before whom they were examined, was a wairant for their tidelity.

After the commissioners, who were appointed to inquire into their character and other requifites, had made a report of them, they were then to fwear that they would maintain the laws; which obligation if they neglicted, they engaged to fend to Delphi a flatue of the weight of their bodies. According to a law of Solon, if an archon got drunk, he was condemned to pay n heavy fine, and fometimes even punished with death. Buch magificates as the Atheman archors were well entitled to respect. Hence it was eternal infamy to infult them; and hence Demosthenes observed, that to treat the thelmocheta with diffespect, was to show difrespect to the republic.

Another qualification indispensably required of the Iecond officer of this tribunal, who was called the king, was, that he had married the daughter of an Atnenian citizen, and that he had espoused her a virgin. This was exacted of him, fays Demosthenes, because part of

Vos. II. Part I.

his duty was to facrifice to the gods jointly with his Archon wife, who, initead of appealing, would have irritated them, if the had not possessed both these honours.

The inquiry into the private title of the nine archons, was very fevere; and this attention was the more neceffary, as they had a right to take a feat in the Areepagus, after they had quitted their office, and given an account of their administration.

When any obscurity occurred in the laws relative to religion and the worship of the gods, the interpretation was submitted to the tribunal of the archons.

Aristotle observes, that Solon, whose aim was to make his people happy, and who found their government in his time authocratical, by the election of the nine archons, who were annual magistrates, tempered their power, by establishing the privilege of appealing from them to the people, called by lot to give their fullrage, after having taken the oath of the Heliaftæ, in a place near the Panathenaum, where Hiffus had formerly calmed a fedition of the people, and bound them to peace by an oath.

The archons were the principal officers, not only in civil, but likewife in facred matters, and especially in the mysteries of Bacchus. The archons, however, who were furnamed conymi, were chiefly employed in civil affairs; yet they prefided at the great feails, and held the first rank there. Hence they are fometimes ityled priefts.

ARCHON is also applied by some authors to divers officers, both evil and religious, under the eaftern or Greek empire. Thus bullops are fornetimes called archonics; and the lame may be faid of the lords of the emperor's court. We also read of the archin of the antimetifia, archon of archons, grand archon, archon of churches, archon of the gulpel, archon of the walls, Se.

ARCHONTICI, in church hillory, a branch of Valentinians, who maintained that the world was not created by God, but by angels called Archantes.

ARCHPRIEST, ARCHPRISBYTER, a priest or preflyter established in some dioceses, with a pre-eminence over the reft. Anciently the archipricit was the first person after the bishop; he was scated in the church next after the bishop; and even acted as his vicar, in his abfence, as to all fpiritual concerns. In the fixth century, there were found feveral archpriefls in the fame diocefe; from which time fome will have them to have been called deans. In the muth century, they diffinguished two kinds of cures or parishes: the fmaller governed by fimple priefts; and the baptifmal churches by archpriefts; who, belide the immediate concern of the cure, had the inspection of the other mferior priests, and gave an account of them to the biflion, who governed the chief or cathedral church, in person. There are archardoytenes still fabiiling in the Greek church; velled with moil of the functions and privileges of chorepifcopi or rural deans.

ARCHTREASURER, the great treasurer of the German empire. This office was created with the eighth electorate, in favour of the elector Palatine, who had lost his former electorate, which was given to the duke of Bavaria, by the emperor Ferdinand II. who took it away from Frederic V. elector Palatine, after the battle of Prague, where he was defeated in maintaining his election to the crown of Bohemia. The dignity of archtreafurer was contelled be-

Archilate tween the elector of Brunswick, who claimed it in virtue of his descent from the elector Frederic and the elector Palatine.

> ARCHILUTE, ARCILEUTO, a long and large lute, having its bass strings lengthened after the manner of the theorbo, and each row doubled, either with a little octave or an unifon. It is used by the Italians

for playing a thorough bafs.

ARCHYTAS of Tarentum, a philosopher of the Pythagorean fect, and famous for being the mafter of Plato, Eudoxas, and Philolaus, lived about 408 years before Christ. He was an excellent mathematician, particularly in that part of the science which regards mechanics: he is faid to have made a wooden pigeon that could fly, and to be the first that brought down mathematics to common uses. He is said to be the inventor of the ten categories. He afferted, that God was the beginning, the supporter, and the end, of all things. There are two epiftles preserved in Diogenes Laertius, one from Archytas to Plato, and another from Plato to Archytas. He acquired great reputation in his legislative capacity. He likewise commanded the army feven times, and was never defeated; but was at last cast away in the Adriatic sea, and thrown upon the coast of Apulia.

ARCIS-SUR-AUBE, a small handsome town of France, in Champagne, feated on the river Aube. E.

Long. 4. 15. N. Lat. 48. 40.

ARCO, a strong town and castle in the Trentin, belonging to the house of Austria. It was taken by the French in 1703, and abandoned foon after. It stands on the river Sarca, near the north extremity of the lake Garda. E. Long. 9. 55. N. Lat. 45. 52.

ARCONA, a strong town situated on the island of Rugen in the Baltic. It slood on a high promontory, with the east, north, and fouth fides defended by steep and lofty precipices, and the west by a wall sifty feet high, proportionably thick, and fecured by a deep and broad ditch. It was, however, taken and ruined, in 1168, by Valdemar king of Denmark. One of the conditions imposed by the conqueror was, that the inhabitants should destroy a temple they had erected to St Vitus, and deliver up the vast treasure belonging to this tutelary faint. Another was, that they should pay 40 filver vokes for oxen, by way of tribute, and enter as foldiers in the Danish service when called upon.

ARCOS, a strong city of Andalusia, in Spain, seated on a high craggy rock, at the bottom of which runs the Guadeleto. Its strength lies not only in its sitution, but in the works erected for its defence, and it is inacceffible on every fide but one. The governor refides in an old castle, from whence there is a delightful prospect, which extends very far into the neighbouring country. W. Long. 2. 10. N. Lat. 36. 40.

ARCTIC, in astronomy, an epithet given to the north pole, or the pole raifed above our horizon. It is called the arxic pole, on occasion of the constellation of the little bear, in Greck called agares; the last star in the tail whereof nearly points out the north pole.

ARCTIC Circle is a leffer circle of the sphere, parallel to the equator, and 23° 30' distant from the north pole; from whence its name. This, and its opposite the antardic, are called the two polar circles; and may be conceived to be described by the motion of the poles of the ecliptic, round the poles of the equator, or of Arctium the world.

ARCTIUM, BURDOCK: A genus of the polyga- Arcturus. mia æqualis order, belonging to the fyngenefia class of plants; and in the natural method ranking under the 49th order, Composita capitata: The calyx is globular; with scales having hooks reflected at the tops.—The species are three, viz. the lappa or common burdock, the tomentofum, and the perfonata. All these are troublesome weeds, so require no direction for their culture. The tender stems of the common kind, deprived of the back, may be boiled and eat like afpara-When raw, they are good with oil and vinegar. Boys catch bats by throwing the prickly heads of this species up into the air. Cows and goats cat this herb; sheep and horse resuse it; swine are not fond of it. The feeds, which have a bitterish subacted talle, are recommended as very efficacious dimetics, given either in the form of emulfion, or in powder to the quantity of a drachm. The roots, which talle sweetish, with a flight auflerity and bitterness, are esteemed aperient, diuretic, and fudorific; and faid to act without irritation, so as to be safely ventured upon in acute diforders.

ARTOPHYLAX, (from menter, bear, and pulution, I guard), in altronomy, a conftellation, otherwise call-

ed Bootes.

ARCTOPUS, in botany: A genus of the polygamia dioccia class; and in the natural method ranking under the 45th order, Umbellata. The umbella of the male is compound; the involucrum confifts of five leaves; the corolla has five petals; the stamina are five; and two piftilli: The umbella of the hermaphrodite is simple; the involucrum is divided into four parts, is spinous, large, and contains many male flowers in the disk. There is but one species of arctopus, viz. the echinatus, a native of Ethiopia.

ARCTOTIS, in botany: A genus of the polygamia necessaria order, belonging to the syngenesia class of plants; and in the natural method ranking under the 49th order, Composite discoides. The receptacle is briftly; the corona of the pappus is pentaphyllous; and the calvx is imbricated with scales loofe at the top. It is commonly called anemospermos, from the resemblance of its seeds to those of the anemone. The species are 11; all of them natives of Ethiopia, or the Cape of Good Hope. Of these the angustifolia with spear-shaped leaves, and the aspera with wingshaped woolly leaves, are most remarkable for their beauty, having rays of a fine yellow or deep gold colour. They flower in May and June.

Culture. All the species of arctotis may be propagated by cuttings; which should be frequently renewed, as the old plants are subject to decay in winter. They may be planted in any of the fummer months in a bed of light fresh earth; observing to shade them from the fun until they have taken root. They should be exposed to the open air until the latter end of Octoher, or longer, if the weather is favourable, when they

must be removed into the greenhouse.

ARCTURUS, in astronomy, a fixed star, of the first magnitude, in the constellation Arctophylax, or Bootes. The word is formed of agares, bear, and seas tail, q. d. bear's tail, as being very near it. This

own to the ancients, as in the following Arcuation fir irgil:

Alurum, pluviasque Hyades, geminasque Triones. re also Job ix. 9. xxxviii. 32.

ARCUATION, in gardening, the method of raifing trees by layers, which is done in the following

Strong mother plants or stools must be planted in a clear border, and in a straight line, about fix feet a-When these have shot sive or six main branches from the root, and as many collateral branches, the former must be bent to the ground, and there fastened. The small branches must be covered three inches deep upon the joints, and have a large bason of earth made round them to hold the water.

About the middle of September they may be opened, and if they have taken root, may be immediately removed into the nursery; but if they have not sufficiently extended their roots, they must be suffered to remain till the spring, and then transplanted.

ARCUCCIO, Arcutio, a machine made of a board, covered with pieces of hoops, like the tilt of a waggon; used in Italy to prevent children from being overlaid and fmothered by nurses or others. Every nurse in Florence is obliged to lay her child in an arcutio, under pain of excommunication.

ARDAMON, or ARDAMA, in antiquity, a veffel of water placed at the door of a person deceased, till the time of burial, as a token that the family was in mourning, and to serve to sprinkle and purify persons as they came out of the house.

ARDASSES, in commerce, the coarsest of all the filks of Persia; and as it were the refuse of each kind. In this fense, they say, the legis, the housets, the choufs, and the payas ardaffes, to fignify the worst of those four forts of Perfian filks.

ARDASSINES, in commerce, called in France ablaques; a very fine fort of Persian silks, little inferior in finenels to the fourbaltis, or rather cherbaffis, and yet it is little used in the filk manufactures of Lyons and Tours, because that kind of filk will not bear hot water in the winding.

ARDEA, in ornithology, a genus of the order of The general characters of this order are thefe: The bill is straight, sharp, long, and somewhat compressed, with a furrow that runs from the nostrils towards the point; the nostrils are linear; and the feet have four toes. Under this genus Linnæus comprehends the grus or crane, the ciconia or flork, and the ardea, or heron of other authors. See Plates LIV. LV.

1. The first species is the pavonia, or crowned crane, which has an erect briftly creft, with the temples and two wattles naked. The head is black; the creft is yellowish, and tipped with black at the top; the wings are white; and the feathers of the tail black, and of an equal length. It is a native of Africa, particularly the coast of Guinea, as far as Cape de Verd; at this last place they are said to be exceedingly tame, and will often come into the court yards to feed with the poultry. These birds are often kept in our menageries, and, with shelter of nights, live a good while. chief food is supposed to be worms, and such other

things as the heron tube usually feed on; also vege- A dea. tables of all kinds. It often fleeps on one leg; runs very fast; and is faid not only to fly well, but to continue on the wing for a long time together. The flesh is said to be very tough.

2. The virgo, with a straight greenish bill and crimfon irides. The crown of the head is ash coloured; the rest of the head, the upper part of the neck behind, and all the under patts, to the breaft, black; the back, rump, and tail, and all the under part from the breaft, are of a bluish ash colour: behind each eye springs a tuft of long white feathers, which decline downwards, and hang in an elegant manner: the quills and tail are black at the ends; the legs black. This species is found in many parts of Africa and Asia, where they frequent marshes and the neighbourhood of rivers, as their food is fish, like most of the heron genus. It is frequently kept in menageries, being endowed with great gentlenels of manners, added to its being an elegant bird. At various times it puts itself into strange and uncouth attitudes, especially those which imitate dancing; and Keysler mentions one in the Great Duke's gallery, at Florence, which had been taught to dance to a certain tune, when played or fung to it. The name this bird is known by in the east is kurki, or querky. Sometimes it will breed in confinement: one is recorded to have lived 24 years at Versailles, where it had been bred.

3. The leucogeranos of Pallas, or Siberian crane of Pennant, is four and a half feet when standing erect. The bill is of a red colour; the indes are white; the plumage is white as fnow, except the 10 fast greater quills, with the coverts of them, which are black: the legs are long and red. This species inhabits the vast marshes and lakes in Siberia, especially those about the Ifchim, and along the rivers Ob and Irtith. It makes its neft among the reeds, feldom accossible by man, upon rifing green graffy tufts, made up of herbs and grafs heaped together; and lays two ash-coloured eggs, spotted with brown. They are shy birds, and always upon their guard against an enemy; having a centinel to warn them of an approach: on the least alarm they cry aloud, not unlike the fwan, and fly off directly. The sportsman finds, in course, much difficulty in approaching them within gunthot; for, as they fland near five feet high from the ground, they are enabled to espy him at a greater distance. Sometimes indeed he approaches them under cover of a stalking horse, or other object; at other times a small dog will divert their attention, as they will without fear attack the dog, while his mafter gets within reach. In breeding time, however, they are more bold, as they will defend their young even against men, so as to make it dangerous to come near their haunts. The male and female are faid to guard the neft by turns.

4. The grus, or common crane of English authors, has a naked papillous crown; the prime feathers of the wings are black; the body is ash coloured; the prime feathers of the tail are ragged. This species is far spread, being met with in great flocks throughout northern Europe and Asia; in Sweden, Russia throughout, and Siberia as far as the river Anadyr, migrating even to the arctic circle. In Kamtschatka they are only seen on the fouthern promontory; are migratory, returning

K k 2

northward

northward to breed in the spring, and generally choofing the same places which had been occupied by them the season before. In the winter they inhabit the warmer regions, fuch as Egypt, Aleppo, India, &c. they are also met with at the Cape of Good Hope, changing place with the season. In their migrations they frequently fly fo high as not to be visible; their passing only being known by the noise they make, which is louder than any other bird. In France they are feen in fpring and autumn; but for the most part are mere passengers.-This species feems to have been formerly. a native of Britain; as we find in Willoughby, page 52, that there was a penalty of twenty pence for destroying an egg of this bird; and Mr Ray informs us, that in his time they were found during the winter in large flocks in Lincolnshire and Cambridgeshire: but at present the inhabitants of those counties are scarcely acquainted with them; fo that those birds feem now to have forfaken our ifland. We are told that they make their nest in the marshes, and lay two bluish eggs. The young birds are thought very good food. They teed on reptiles of all kinds, and in turn on green corn; of which last they are said to make so great havock, as to ruin the farmers wherever the flocks of thefe depredators alight.

5. The Americana, or hooping crane of Edwards, is a native of America. The crown of the head and temples are naked and papillous; the forehead, nape of the neck, and prime wing feathers, are black; but the body is white: The under part of the head, as far as the lower chap, is red; the beak is yellowish, and jagged at the point; the feet are red, and the prime tail feathers white. This is an American fpecies, often feen at the mouths of the Savanna, Aratamaha, and other rivers near St Augustine; in spring going to the north to breed, like the common crane, and returning, like that bird, to the fouth in autumn. In the fummer they are found in Hudson's Bay, at which place they arrive in May, and retire in September; and are chiefly met with in unfrequented places, in the neighbourhood of lakes, where they breed. The nest is made on the ground, composed of grass and feathers. They lay two white eggs, like those of the swan, and fit 20 days; the young are at first yellow, changing to white by degrees. These birds have a loud long note, which may be heard at a great distance: their food is chiefly worms and infects, which it fearches for at the bottom of ponds. The natives of Hudson's Bay call this species Waparw-uchechauk.

6. The argil, or hurgil, of Ives, is a very large species; from tip to tip of the wings measuring 14 feet 10 inches; and from the tip of the bill to the claws feven feet and a half: the bill is 16 inches round at the base, of different colours, and nearly of a triangular shape; the feathers of the back and wings are very ftrong, and of an iron colour; those of the breaft long: over the belly a great deal of down, of a dirty white: the legs and half the thighs are naked; the naked

parts full three feet in length.

This monfter, as Ives terms it, inhabits Bengal, and is also found at Calcutta; at the last place called Hurgell, or Argill. It majestically stalks along before one, and appears at first like a naked Indian. The common opinion is, that the fouls of the Brumins possels these birds. On opening one of these, a terapin, or land tortoife, 10 inches long, was, and a large male black cat was found mach. In Sumatra there is faid to be a craw, of the flork kind; some of a prodigious fize, towife curious; as the Boorong Cambing, anty ringular.

The same species seems to have been remarked by Mr Smeathman in Africa, while refident there; an 50 ... adult of one of which will often measure seven feet when standing creet. He describes the plumage much Part I. the same as in Mr Ives's bird; adding, that the gape is monftroufly wide: the head is covered with white down, thinly difperfed, appearing not unlike a gray-headed man: on the middle of the neck before, a long, conic membrane, like a bladder, fprinkled very thinly with fhort down, rifing or falling as the animal moves the beak, and always appearing inflated. These birds are met with in companies. When feen at a diffance, near the mouths of rivers, coming towards an observer, which they do with their wings extended, they may well be taken for canoes, upon the furface of a fmooth fea: when on the fand banks, for men and women picking

up shell fish or other things on the beach.

One of these, a young bird, about five feet in height, was brought up tame, and prefented to the chief of the Bananas, where Mr Smeathman lived; and being accustomed to be fed in the great hall, foon became familior; duly attending that place at dinner-time, and placing itself behind its matter's chair, frequently before any of the guefts entered. . The fervants were obliged to watch it narrowly, and to defend the provisions with switches in their hands; but, notwithstanding this, it would frequently fnatch off somewhat or other, and was known once to have purloined a whole boiled fowl, which it swallowed in an instant. Its courage is not equal to its voracity; for a child of eight or ten years old foon puts it to flight with a fwitch, though at first it feems to stand upon its defence, by threatening with its enormous bill widely extended, and crying out with a loud hoarse voice like a bear or tyger. It is an encmy to fmall quadrupeds, as well as birds and reptiles, and destroys fowls and chickens, though it dare not attack a hen with her young openly: it preys also on rats, young kittens, and the like; and has been known to swallow a cat whole: a bone of a shin of beef being broken asunder, serves it but for two morsels. The individual above mentioned used to fly about the island, and rooft very high among the filk-cotton trees; from whence, at two or three miles distance, it could spy the dinner carrying across the yard; when, darting from its station, it would enter promiscuously with the women who carried in the dishes. When sitting, it was observed to rest itself on the whole length of the hind part of the leg. It sometimes stood near, for half an hour after dinner, with the head turning alternately, as if liftening to the conversation; and during this time would every three or four minutes void the excrements, which were liquid and whitish; and took care always to do this on its legs, by wheeling the back parts round over one or the other, and this regularly on different legs; for if it had muted on the left leg lall, it would be fure to do the fame on the right the next time, never making any mistake.

7. The ciconia, or white flork of Ray, has naked eye balls, and black prime wing-feathers. The flin be-

times this proverb

ed to He

does not

know a

Arden/low the feathers, as also the beak, feet, and claws, are of a blood colour. It is a native of Europe, Asia, and Africa; but is feldom or never to be met with in Italy. The ciconia feeds upon amphibious animals. It is fuch an enemy to serpents, that it is reckoned almost a crime to kill a stork. From this favourable treatment, they are feen in Holland and the Low Countries walking unconcerned in the middle of the streets. Storks are birds of paffage; they spend the summer in Europe, and disappear all at once, and go off to Egypt, Ethiopia, &c. before winter, and do not return till about the middle of March.

8. The major, or common heron, has a black creft depending from the back part of the head, an ash coloured body, and a black line and belt on the neck and breaft. It is a native of Europe. This bird is remarkably light in proportion to its bulk, scarce weighing three pounds and a half: the length is three feet two inches; the breadth five feet four inches. The body is very finall, and always lean; and the skin scarce thicker than what is called gold-beater's skin. It must be capable of bearing a long abilinence, as its food, which is fith and frogs, cannot be readily got at all times. It commits great devastation in our ponds; but being unprovided with webs to fwim, nature has game, heron-hawking being so favourite a diversion of our ancestors, that laws were enacted for the preservation of the species, and the person who destroyed their eggs was liable to a penalty of twenty shillings for each offence. Not to know the hawk from the heron-shaw · In after-was an old proverb*, taken originally from this diver-

> 9. The garzetta, or egret, is crested behind; the body is white, the beak black, and the feet greenish. It is a most elegant bird. It weighs about one pound; and the length is 24 inches, to the end of the legs 32. It is a native of the call: But that formerly it was very frequent in Britain, appears by some of the old bills of fare; in the famous fealt of Archbishop Neville, we find no less than a thousand afterides, egrets, or egrittes, as it is differently spelt. Perhaps the esteem' they were in as a delicacy during those days occasioned their extirpation in our islands; abroad they are still common, especially in the southern parts of Europe, where they appear in flocks. The scapulars and the

crest were formerly much esteemed as ornaments for caps and head-pieces; fo that aigrette and egret came to fignify any ornament to a cap, though originally the word was derived from aigre, a cause de l'aigreur de sa voix.

10. The herodian or cristata maxima of Catesby, is crefted behind, has a dusky-coloured back, reddish thighs, and the breast speckled with oblong black spots. It is four feet and a half when erect; the bill is about eight inches from the angle of the mouth to the end of it; and the creft is made up of long, narrow, brown feathers, the longest being five inches in length, which -it can erect and let fall at pleasure. It is a native of Virginia, and feeds not only upon fish and frogs, but

on lizards, ests, &c.

11. The stellaris, or bittern, has a smooth head; it is variegated through the whole body with dark-coloured spots of different figures and fizes. It is a native of Europe, and inhabits chiefly the fen countries. It is met with skulking among the reeds and fedges; and its usual posture is with the head and neck erect, and the beak pointed directly upwards. It will fuffer perfons to come very near it without rifing; and has been known to firike at boys and at sportsmen, when wounded and unable to make its escape. It flies principally about the dulk of the evening, and then rules in a very fingular manner, by a spiral ascent, till it is quite out of fight. It makes a very strange noise when it is among the reeds, and a different and very fingular one as it rifes on the wing in the night. It builds its nest with the leaves of water plants on fome dry clump among the reeds, and lays five or fix eggs of a cincious green colour. This bird and the heron are very apt to strike at the fowler's eyes when only maimed. The food of the bittern is chiefly frogs; not that it rejects fish, for small trouts have been met with in their stomachs. In the reign of Henry VIII, it was held in much efteem at our tables, and valued at one shilling. Its flesh has much the flavour of a hare, and nothing of the fishings of that of the heron.

12. The violacea, or crefted bittern of Catefly, has a white crest; the body is variegated with black and white, and bluith below. These birds are I can in Carolina, in the rainy feafons: but in the Bahama islands, they breed in bushes growing among the rocks in prodigious numbers, and are of great. use to the inhabitants there; who, while these birds are young and unable to fly, employ themselves in taking them for the delicacy of their food. They are, in fome of these rocky islands, so numerous, that in a few hours two men will load one of their calapatches, or little boats, taking them perching from off the rocks and bushes, they making no attempt to escape, though almost full grown. They are called by the Bahamians erab-catchers, crabs being what they mostly subsist on; yet they are well talled, and free from any rank or fishy favour.

There are 67 other species enumerated by ornitho-

ARDEA (anc. grog.), a town of Latium, the royal refidence of Turnus king of the Rutuli, (Livy); fo called, either from the augury of the heron, (Hyginus); or from the excessive heat of the country, (Martial). It was in a marshy, fickly situation, (Strabo, Seneca). It was built by Danae, the mother of Perfeus,

furnished it with very long legs to wade after its prey. It perches and builds in trees, and fometimes in high cliffs over the fea, commonly in company with others, like rooks. It makes its nell of flicks, lines it with wool, and lays five or fix large eggs of a pale green colour. During incubation, the male passes much of his time perched by the female. They defert their nests during the winter, excepting in February, when they refort to repair them. It was formerly in this island a bird of

lion; but in course of time served to express great ignorance in any science. This bird was formerly much was absurd-esteemed as a food; made a favourite dish at great tay corruptbles; and was valued at the same rate as a pheasant. It is faid to be very long lived: by Mr Keysler's account it may exceed 60 years; and by a recent inflance of Bawk from one that was taken in Holland by a hawk belonging to a band-fam. the Stadtholder, its longevity is again confirmed, the

bird having a filver plate fastened to one leg, with an inscription, importing it had been before struck by the elector of Cologne's hawks in 1735 .- The cinerea of

Linnaus is the female of this species.

(Virgil);

Ardebil, Arden. (Virgil); above five miles distant from the sea, and 20 from Rome: now a hamlet. It was a Roman colony, (Livy); the inhabitants called Ardentes. E. Long.

17. 49. Lat. 41. 30.

ARDEBIL, or ARDEVIL, a town of Persia in the province of Aderbijan. It was taken and burnt by Tenghiz Khan in 1222, when most of the inhabitants were destroyed: but it has been since rebuilt; and is still ranked for dignity among the best cities of the kingdom, on account of its having been the refidence and burying-place of some of the Persian kings; particularly the sepulchre of Sheik Sesi is at this place, to which the people refort in pilgrimage. He founded a place, which they call his kitchen, with a revenue fufficient to maintain 1000 poor people, and to feed them three times a-day. Three or four of the largest principal streets have shops, and are planted on each fide with elms and linden trees, to keep off the exceffive heat of the fun; but the houses are poorly built, with bricks dried in the fun: yet most of them, that are not in the bazars or market places, have the pleafure and conveniency of a garden full of trees bearing fruit; and there are large spots in the out parts of the town, where the houses are at a distance from each other, and the spaces between planted with trees, which render the city of a large extent. The meidan, or great square, is 300 paces long, and 150 broad, having shops all round; which, when this place was in a flourithing condition, were flored with all manner of valuable commodities.

Through the city there pass two branches of a rivulet, which are fometimes enlarged by the melting of the fnow on the mountains, fo that they have been forced to make canals to divert the stream. In the reign of Shah Abbas, it broke down the dikes, and carried away a great number of houses. The city is without walls, and is feated in the midst of a large plain encompassed with mountains, the highest of which lies westward, and is always covered with snow. These render the air fometimes extremely hot, and at others intolerably cold, which occasious epidemical distempers, that carry off great numbers of people. The foil produces no fruit near the city but apples, pears, and peaches; and yet is good both for corn and pasture. sheep are so numerous, that 100,000 have passed over the city bridge in a day. There are here feveral forts of mineral waters, which ferve both for common bathing, and for the cure of various difeases; one of these is a fulphureous fpring, whose exhalations render the circumambient air extremely difagreeable. There are three springs which produce as hot water as if it was boiling; and from which, waters are conveyed to the public baths in the city. About half a league from the city, on the right hand of the public road, there is a pool of standing water, which is covered all over with falt like ice. E. Long. 47. 30. N. Lat 37. 55.

ARDEN, the common name of forests among the Celtæ, from the widely extensive one which ranged for 500 miles across the country of Gaul, or to that which covered more than half the county of Warwick in Britain, and the sites of which still retain the appellation of Arden, to the much smaller one of the aucient Mancenion, that covered and surrounded the site of the present Manchester. It is written Arduen by Cessar and Tacitus in speaking of the forest in Gaul, and Ardven

by Offian in mentioning the woods of Caledonia. It\rdenburg cannot (favs Mr Whitaker) be compounded of ar the prepositive article in Celtic, and the substantive den, as Ardrah. Baxter and Camden affert it to be; but is formed of ard an adjective, and ven the same as den. The meaning of the name therefore is not, as Mr Baxter renders it, fimply the hills, or even; as the ingenious translator of Ossian interprets it, the bigh bill. Ard signifies either bigh or great, and wen or den either a bill or wood. Arduen, Ardven, or Arden, then, means a confiderable wood. Hence, only, the name became applicable to fuch very different fites, as the plains of Warwickshire and the hills of Scotland: and it was given, not only to the most extensive forests, to that which was the greatest in Gaul, or so considerable in Britain; but to many that were important only within their own contracted districts, as the wood of Mancenion above mentioned, and others.

ARDENBURG, a town of the Netherlands, in Dutch Flanders, and formerly the most considerable in that country; but has been dismantled by the Dutch.

E. Long. 3. 30. N. Lat. 51. 16.

ARDENNE, a forest in France, formerly of vast extent; but the trees are in many places grubbed up, and where they slood are built cities, towns and abbeys. At present it extends from Thionville, near the country of Liege, to Donchery and Sedan, on the confines of Champagne. The roads are so narrow in some places, that two waggons cannot pass each other; and therefore the waggoners are obliged to provide themselves with bells or horns to give one another notice to stop in time.

ARDENTES, in middle-age writers, an appellation given to those afflicted with the ignis sacer, or erysipelas. They were thus called, as sceming to be scorched or burned with the disease. Hence also the abbey of St Genevieve at Paris is called *Domus Ardentium*, by reason, as it is said, that great numbers were cured of that distemper at the shrine of this saint, in

the reign of Lewis VI.

ARDES, a town of France, in Lower Auvergne, and the principal place of the duchy of Mercœur. It serves as a mart for the commodities and trade between Upper and Lower Auvergne. E. Long. 3. 10. N. Lat. 45. 22.

ARDFERT, a town of Ireland, was the ancient capital of Kerry, with an university, which was held in the highest esteem. It is a bishop's see, and borough by ancient prescription, and has been held in commendam with the bishopric of Limerick ever since the Refloration. The bishops were anciently called Bishops of Kerry. St Brandon, to whom the cathedral is dedicated, had his first education in this county, under Bishop Ert; but he sinished his studies in Connaught, St Jarlath bishop of Tuam being his preceptor. The ruins here are very extensive. Near the cathedral was an anchorite tower, the loftiest and finest in the kingdom, being 120 feet high: it fell suddenly in 1771. In the ruined churches there are feveral infcriptions round the mouldings of the tomb stones; and over an arch, behind Lord Glandore's house, is an inscription in relief done in a matterly manner, but the characters unknown.

ARDRAH, a fmall territory or kingdom of Africa, in Guinea properly fo called. It lies at the bottom

Ardres of the gulf of St Thomas, and has a town called Arhes, supposed to be the capital. The inhabitants are Areca. very licentious, and have neither temple nor any place for religious worship. However they are very courageous; and their king was absolute till lately that the king of Dahomy made war upon this and the neighbouring teritories, brought them under subjection, and burnt the towns, particularly Ardres. The air is very unwholesome to Europeans; yet the natives live to a great age; but the smallpox makes great dellruction among them. This country is fertile in Indian corn, palm wine, plants, and fruits, which last all the year; and they make a great deal of falt.

> ARDRES, a small but strong town in France, in Lower Picardy. Here was an interview between Francis I. and Henry VIII. king of England in 1520. It is feated in the midit of a morafs. E. Long. 2. 0.

N. Lat. 50. 35.

ARDS, barony of, in the county of Down in Ireland: it is a narrow flip of land, in some places three and in none above fix miles broad; but the foil is for the most part tolerably good. It lies between the lake of Strangford and the sea, and in the south part it is opposite to Lecale. Sir Thomas Smith obtained a patent for this barony from Queen Elizabeth, and fent his natural fon with a colony to possess it; but he was intercepted and slain by an Irishman. After Sir Thomas's death, Ards was granted by James I. to some of the Scots nobility.

ARDUBA, an ancient city of the Pannonians. It was taken by Germanicus about the 7th year of the Christian æra; but its reduction was more owing to the disagreement that reigned among the inhabitants than to the valour of the Romans. The greater part of the citizens were for submitting; but the women more fond of their ancient laws and liberties than the men, joined some Roman deserters, and falling upon their husbands, killed a great number of them; but being at laft overcome by the men, who then submitted to the Romans, the women either threw themselves headlong from the tops of the walls, or, setting fire to their houses burnt themselves and their children to death.

AREA, in general, denotes any plain furface, whereon we walk, &c. The word is Latin, importing more properly a threshing floor; and is derived from arere, " to be dry."

AREA in architecture, denotes the space or site of ground on which an edifice stands. It is also used for inner courts and those portions of ground.

AREA, in geometry denotes the superficial content of any figure. Thus, if a figure, e.g. a field, be in form of a square, and its side be 40 feet long, its area is said to be 1600 square feet; or it contains 1600 little fquares, each a foot every way.

AREB, a kind of imaginary money used in the dominions of the Great Mogul. Four arebs are equal to one crou, or 100 lacs; one lac to 100,000 roupees.

AREBO, or Arebon, a town on the Slave coast of Guinea, in Africa, feated at the mouth of the river Formosa. The English had once a factory there, as the Dutch have still. It is a large oblong place, indifferently well peopled, and furnished with houses built of reeds and leaves. E. Long. 5. 5. N. Lat. 5. 0.

ARECA, the FAUSEL-NUT, in botany a genus of the order of palmæ pennatifoliæ. The male has no calyx, but three petals, and nine stamina; the female has no Arccacalyx; the corolla has three petals, and the calyx is imbricated. There are two species, viz.

1. The catechu, a native of India. This has no branches, but its leaves are very beautiful; they form a round tuft at the top of the trunk, which is as firaight as an arrow. It grows to the height of 25 or 35 feet, and is a great ornament in gardens. The shell which contains the fruit is fmooth without, but rough and hairy within; in which it pretty much resembles the shell of the cocoa nut. Its fize is equal to that of a pretty large walnut. Its kernel is as big as a nutmeg, to which it bears a great refemblance without, and has also the same whitish veins within when cut in two. In the centre of the fruit, when it is foft, is contained a grayith and almost liquid substance, which grows hard in proportion as it ripens. The extract of this nut has been supposed to be the terra japonica of the shops, at least that it is a very fimilar substance both in colour and tafte: But according to latter observations the genuine drug feems to be obtained from the Mimofa Catechu. The fruit when ripe is aftringent, but not unpalatable, and the shell is yellowish. Of this fruit there is a prodigious confumption in the East Indies, there being scarce any person, from the richest to the poorest, who does not make use of it; and the trade they drive in it is incredible. The chief use that is made of areca is to chew it with the leaves of betcl, mixing with it lime made of fea fhells*. In order to *Cornelius chew it, they cut the areca into four quarters, and le Brun afferts, that take one quarter of it, which they wrap up in a leaf they rub of betel, over which they lay a little of the line; af-the leaves terwards they tie it by twilling it round. This bit of betel prepared for mastication is called pinang; which is a with a red Malayan word used all over the East Indies. The drug of Siam, or pinang provokes spitting very much, whether it be with white. made with dried or fresh areca; the spittle is red, chalk. which colour the areca gives it. This maltication cools the mouth, and fallens the teeth and gums. When they have done chewing the pinang, they fpit out the grofs fabiliance that remains in the mouth. They are under a mistake who imagine that fresh areca melts entirely in the mouth. Nor is it less a mistake to think that the teeth which are tinged red during the time of chewing, always retain that colour. As foon as they have done chewing the pinang, they wash their mouth with fresh water, and then their teeth are white again. The Europeans who live at Batavia, or Malaca, and in the Sunda and Molucca islands, use pinang as much as the Indians do; and by washing their teeth they preferve them white. Some pretend that areca firengthens the flomach, when the juice of it is swallowed, as most of the Indians do. Another property afcribed to it, is its curing or carrying off all that might be unwholesome or corrupt in the gums. When eaten by itself, as is sometimes done by the Indians, it impoverishes the blood, and causes the jaundice; but is not attended with thefe incoveniences when mixed in the usual way with betel. The Siamele call it plou in their language. The best areca of the Indics comes from the island of Ceylon. The Dutch East India Company send a great deal of it in their ships into the kingdom of Bengal. There grows in Malabar a fort of red areca, which is very proper for dying in that colour. The fame company fend

E

Areca. Some of it from time to time to Surat and Amedabad, for the use of the dyers in the dominions of the Great Mogul.

2. The oleracea, or true cabbage palm, is the most beautiful, and perhaps the talleft, of all trees. The trunk is perfectly flraight, and marked with rings at the veiligize of the footstalks of the leaves. Near the ground it is about feven feet in circumference; but tapers as it afcends, and attains the height of 170 or 200 feet. The bark is of an ash colour till within 25 or 30 feet of the extremity of the tree; when it alters at once to a deep fea green, which continues to the top. About five feet from the beginning of the green part upwards, the trunk is furrounded with its numerous branches in a circular manner; all the lowermork foreading horizontally with great regularity; and the extremities of many of the higher branches hend wavingly downwards, like fo many plumes of feathers. These branches, when full grown, are 20 feet long, more or lefs; and are thickly fet on the trunk alternately, rifing gradually superior one to another: Their broad curved lockets so surround the trunk, that the fight of it, whilst amongst these, is lost, which again appears among the very uppermost branches, and is there enveloped in an upright green conic spire, which beautifully terminates its great height. The abovementioned branches are fomewhat round underneath, and flightly grooved on the upper fide: They are likewife decorated with a very great number of green pennated leaves: Some of these are near three feet long, and an inch and a half broad, growing narrower towards their points, as well as gradually decreasing in length towards the extremities of the branches. As there are many thousand leaves upon one tree: every branch bearing many fcores upon it, and every leaf being fet at a small and equal distance from one another, the beauty of fuch a regular lofty group of waving foliage, fusceptible of motion by the most gentle gale of wind, is not to be described. The middle rib, in each leaf, is ftrong and prominent, supporting it on the under fide, the upper appearing smooth and shining. The pithy part of the leaf, being scraped off, the inside texture appears to be fo many longitudinal thread-like filaincuts. Thefe, being fpun in the fame manner as they do hemp, or flax, are used in making cordage of every kind, as well as fishing nets, which are esteemed thronger than those usually made from any other material of the like nature.

Upon removing the large leaves, or branches, which furround the top of the trunk a little way above the beginning of the green bark just mentioned, what is called the adhage is discovered lying in many thin, thow white brittle flakes, in tathe refembling an almond, but fweeter. This fubitance, which cannot be procured without deltroying the tree, is boiled, and eaten with mutton by the inhabitants of the West Indies. in the fime manner as turnips and cabbage are with us; though it must appear the height of extravagancy and laxary to fell fo flately a tree, which would be an ornament to the most magnificent pulses in Europe, to gratify the talle of any epicire, especially as there is but a very finall part of it eatable. What is called the callage-flower, grows from that part of the tree where the affi-coloured trunk joins the green part

already described. Its first appearance is a green life. Areca, ky spatha, growing to above 20 inches long and abor Archite. four broad; the infide being full of fmall white flringy filaments, full of alternate protuberant knobs, the smallest of these resembling a fringe of coarse white thread knotted: thefe are very numerous, and take their rife from larger footstalks: and these footstalks likewise are all united to different parts of the large parent stalk of all. As this hufky spatha is opened while thus young, the farinaceous yellow feed in embryo, refembling fine faw dust, is very plentifully dispersed among these stringy filaments, which answer the use of apices in other more regular flowers: thefe filaments being cleared of this duft, are pickled, and effected among the best pickles either in the West Indies or in Europe. But if this spatha is not cut down and opened whilst thus young; if it be suffered to continue on the tree till it grows ripe and burfts; then the enclosed part, which whilft young and tender is fit for pickling, will by that time have acquired an additional hardness, become foon after ligneous, grow bushy, confisting of very many fmall leaves, and in time produce a great number of fmall oval thin-shelled nuts, about the bignels of unhulked coffee berries: Thefe, being planted, produce young cabbage tiecs.

The fockets or grooves, formed by the broad part of the footilalks of the branches, are used by the negroes as cradles for their children. On the inner fide of the very young footstalks are tender pellicles, which, when dried, it is faid, make a writing paper. The trunks ferve as gutterings; the pith makes a fort of fago; and the nuts yield oil by decoction. In the pith also, after the trees are felled, there breeds a kind of worms, or grubs, which are eaten and esteemed a great delicacy by the French of Martinico, St Domingo, and the adjacent illands. These worms, says Father Labat, are about two inches long, and of the thickness of one's finger; the head is black, and attached to the body without any distinction of neck. Their preparation for the table is as follows: They are strung on wooden skewers before a fire; and as soon as heated, are rubbed over with raspings of crust, salt, pepper, and nutneg: this powder absorbs all the fat, which during the cookery would otherwife escape; when properly roafted, they are ferved up with orange or citron fance. These worms being exposed for some time to the sun, are faid to yield an oil which is of great efficacy in the piles. The oil in question, fays Labat, is never to be heated before its application to the part affected; as repeated experiments have evinced that its spirit is totally diffipated by the fire.

ARELATE, or Arelatum, is a town of Gallia Narbonensis, situated on the Rhone, denoting a town on, or beyond, a marsh, according to the particular fituation of the speaker; called Arclate Sextanorum, (Pliny, Mela, Coin), because it had a colony of the fixth legion. Writers of the lower age call it Arelas Alis, (Prudentius, Aufonius). There was a double Arelas, one on each fide of the river, and joined by a bridge, (Aufonius); that on the left fide is thought to have been built by Constantine. Tiberius's father was fent by Julius Carfar at the head of the colony, (Suctonius); and hence the appellation Julia Paterna, as appears from an infeription. It was the favou-

Arutoxe- nice in three books, all that are come down to us, together with Ptolemy's Harmonics, were first published by Gogavinus, but not very correctly, at Venice, 1562, in 4to, with a Latin version. John Meursius next translated the three books of Aristoxenus into Latin, from the MS. of Jos. Scaliger; but according to Meibomius, very negligently. With these he printed at Leyden, 1616, 4to, Nicomachus and Alypius, two other Greek writers on music. After this, Meibomius collected these musical writers together; to which he added Euclid, Bacchius senior, Aristides Quintilianus; and published the whole, with a Latin version and notes, from the elegant press of Elzevir, Amst. 1652.

The learned editor dedicates these ancient musical Aristone treatifes to Christina queen of Sweden. Aristoxenus is faid by Suidas to have written 452 different works, among which those on music were the most esteemed; yet his writings on other subjects are very frequently quoted by ancient authors, notwithstanding Cicero and fome others fay that he was a bad philosopher, and had nothing in his head but music. The titles of several of the lost works of Aristoxenus, quoted by Athenæus and others, have been collected by Meursius in his notes upon this author, by Tonfius and Menage, all which Fabricius has digested into alphabetical order.

RIT H M

IS a feience which explains the properties of num-bers, and shows the method or art of computing by them.

History of Arithmetic.

AT what time this science was first introduced into the world, we can by no means determine. fome part of it, however, was cocval with the human race is absolutely certain. We cannot conceive how any man endowed with reason can be without some knowledge of numbers. We are indeed told of nations in America who have no word in their language to express a greater number than three; and this they call patarrarorincouroac: but that fuch nations should have no idea of a greater number than this, is absolutely incredible. Perhaps they may compute by threes, as we compute by tens; and this may have occasioned the notion that they have no greater number than three.

But though we cannot suppose any nation, or indeed any fingle person, ever to have been without some knowledge of the difference between greater and fmaller numbers, it is possible that mankind may have fublished for a considerable time without bringing this science to any perfection, or computing by any regular scale, as 10, 60, &c. That this, however, was very early introduced into the world, even before the flood, we may gather from the following expression in Enoch's prophecy, as mentioned by the apostle Jude: " Behold, the Lord cometh with ten thousands of his faints." This shows, that even at that time men had ideas of numbers as high as we have at this day, and computed them also in the same manner, namely by tens. The directions also given to Noah concerning the dimensions of the ark, leave us no room to doubt that he had a knowledge of numbers, and of measures likewise. When Rebekah was sent away to Isaac, Abraham's fon, her relations wished she might be the mother of thousands of millions; and if they were totally unacquainted with the rule of multiplication, it is difficult to fee how fuch a wish could have been formed.

It is probable, therefore, that the four fundamental rules of Arithmetic have always been known to some nation or other. No doubt, as fome nations, like the Europeans formerly, and the Africans and Americans

now, have been immerfed in the most abject and deplorable state of ignorance, they might remain for fome time unacquainted with numbers, except fuch as they had immediate occasion for; and, when they came afterwards to improve, either from their own industry, or hints given by others, might fancy that they themfelves, or those from whom they got the hints, had invented what was known long before. The Greeks were the first European nation among whom arithmetic arrived at any degree of perfection. M. Goguet is of opinion, that they first used pebbles in their calculations: a proof of which he imagines is, that the word \$1000, which comes from \$1000, a little stone, or flint, among other things, fignifies to calculate. The same, he thinks, is probable of the Romans; and derives the word calculation from the use of little stones (calculi) in their first arithmetical operations.

If this method, however, was at all made use of, it must have been but for a short time, since we find the Greeks very early made use of the letters of the alphabet to represent their numbers. The 24 letters of their alphabet taken according to their order, at first denoted the numbers 1, 2, 3, 4, 5, 7, 8, 9, 10, 20, 30, 40, 50, 60, 70, 80, 100, 200, 300, 400, 500, 600, 700, and 800; to which they added the three following, e, b, D, to represent 6, 90, and 900. The difficulty of performing arithmetical operations by fuch marks as these may easily be imagined, and is very conspicuous from Archimedes's treatise concerning the dimensions of a circle.

The Romans followed a like method; and befides characters for each rank of classes, they introduced others for five, fifty, and five hundred. Their method is still used for distinguishing the chapters of books, and fome other purpoles. Their numeral letters and values are the following:

IVXL One, five, ten, fifty, one hundred, five hundred, one thousand.

Any number, however great, may be represented by repeating and combining these according to the following rules:

1st, When the same letter is repeated twice, or oftener, its value is represented as often. Thus II fignifies two; XXX thirty, CC two hundred.

2d, When a numeral letter of leffer value is placed after one of greater, their values are added: thus XI arthore. to form different tenets from those of his mafter, who became highly piqued at his behaviour. Upon the death of Plato, he quitted Athens; and retired to Atarnya, a little city of Mysia, where his old friend Hermias reigned. Here he married Pythias, the fifter of this prince, whom he is faid to have loved fo passionately, that he offered facrifice to her. Some time after, Hermias having been taken prisoner by Meranon the king of Persia's general, Aristotle went to Mitylene the capital of Leibos, where he remained till Philip king of Macedon having heard of his great reputation, fent for him to be tutor to his son Alexander, then about 14 years of age: Aristotle accepted the offer; and in eight years taught him rhetoric, natural philofophy, ethics, politics, and a certain fort of philosophy, according to Plutarch, which he taught nobody else. Philip crected statues in honour of Aristotle; and for his fake rebuilt Stagyra, which had been almost ruined by the wars.

The last fourteen years of his life he spent mostly at Athens, furrounded with every affistance which men and books could afford him for profecuting his philofophical inquiries. The glory of Alexander's name, which then filled the world, enfured tranquillity and respect to the man whom he distinguished as his friend: but after the premature death of that illustrious protector, the invidious jealoufy of priests and fophists inflamed the malignant and superstitious fury of the Athenian populace; and the same odious passions which proved fatal to the offensive virtue of Socrates, siercely usfailed the fame and merit of Aristotle. To avoid the cruelty of perfecution, he fecretly withdrew himfelf to Chalcis in Euboea. This measure was sufficiently inflified by a prudent regard to his personal safety, but lest his conduct should appear unmanly, when contrasted with the firmness of Socrates in a similar situation, he condescended to apologize for his slight, by faying, that he was unwilling to afford the Athenians a second apportunity " to fin against philosophy." He seems to have survived his retreat from Athens only a few months; vexation and regret probably ended his days.

Besides his treatifes on philosophy, he wrote also on poetry, rhetoric, law, &c. to the number of 400 treatiles, according to Diogenes Laertius; or more, according to Francis Patricius of Venice. An account of fuch as are extant, and of those said to be lost, may be feen in Fabricius's Bibliothera Graca. He left his writings with Theophrastus, his beloved disciple and fucceffor in the Lyezum; and forbade that they should ever be published. Theophrastus, at his death, trusted them to Neleus, his good friend and disciple; whose heirs buried them in the ground at Scepsis, a town of Troas, to secure them from the king of Pergamus, who made great fearch everywhere for books to adorn his library. Here they lay concealed 160 years, until, being almost spoiled, they were fold to one Apellicon, a rich citizen of Athens. Sylla found them at this manufacte, and ordered them to be carried to Rome. The were some time after purchased by Tyrannion a greenmarian: and Andronicus of Rhodes having bought them of his heirs, was in a manner the first reflorer of the works of this great philosopher; for he not only repaired what had been decayed by time and ill keeping, but also put them in a better order, and them copied. There were many who followed the

doctrine of Aristotle in the reigns of the 12 Celars, Aristotle, and their numbers increased much under Adrian and Aristoxe-Antoninus: Alexander Aphrodinus was the first professor of the Peripatetic philosophy at Rome, being appointed by the emperors Marcus Aurelius and Lucius Verus; and in succeeding ages the doctrine of Aristotle prevailed among almost all men of letters, and many commentaries were written upon his works.

The first doctors of the church disapproved of the doctrine of Aristotle, as allowing too much to reason and sense; but Anatolius bishop of Laodicea, Didymus of Alexandria, St Jerome, St Augustin, and severai others, at length wrote and spoke in favour of it. In the fixth age, Boethius made him known in the west, and translated some of his pieces into Latin. But from the time of Boethius to the eighth age, Joannes Damascenus was the only man who made an abridgment of his philosophy, or wrote any thing concerning him. The Grecians, who took great pains to restore learning in the 11th and following ages, applied much to the works of this philosopher, and many learned men wrote commentaries on his writings: amongst these were Alfarabius, Algazel, Avicenna, and Averroes. They taught his doctrine in Africa, and afterwards at Cordova in Spain. The Spaniards introduced his doctrine into France, with the commentaries of Averroes and Avicenna; and it was taught in the university of Paris, until Amauri having supported some particular tenets on the principles of this philosopher, was condemned of herefy, in a council held there in 1210, when all the works of Aristotle that could be found were burnt, and the reading of them forbidden under pain of excommunication. This prohibition was confirmed, as to the physics and metaphysics, in 1215, by the pope's legate; though at the fame time he gave leave for his logic to be read, instead of St Augustin's used at that time in the university. In the year 1265. Simon, cardinal of St Cecil, and legate from the holy fee, prohibited the reading of the physics and metaphysics of Aristotle. All these prohibitions, however, were taken off in 1366; for the cardinals of St Mark and St Martin, who were deputed by Pope Urban V. to reform the university of Paris, permitted the reading of those books which had been prohibited: and in the year 1448, Pope Stephen approved of all his works, and took care to have a new trauslation of them hito Latin.

ARISTOXENUS, the most ancient musical writer; of whose works any tracks are come down to us... He was born at Tarentum, a city in that part of Italy called Mogna Grecia, now Calabria. He was the fon of a musician, whom fome call Mnessas, others Spintharus. He had his first education at Mantistra, a city of Arcadia, mider his father, and Lampyrus of Erythrie; he next studied under Kenophilus, the Pythagorean; and laftly under Afiftotle, in company with Theophradius. Suidas, from whom these particulars are transcribed, adds; that Aristokenus; enraged at Aristotle's having bequeathed his school to Theophrastus, traduced him ever after. But Aristocles the Peripatetic, in Eusebius, exculpates Aristoxenus in this particular, and affures us, that he always spoke with great respect of his master Avistotle. From the preceding account it appears that Aristoxenus lived under Alexander the Great and his first successors. His Harmo-

nos Aristote-

Aristophs which she could not say of any other piece; and that the pleasure which she received from it was so exquifite, that she forgot all the contempt and indignation which Aristophanes deserved for employing his wit to ruin a man, who was wildom itself, and the greatest ornament of the city of Athens. Aristophanes having conceived some aversion to the poet Euripides, satirizes him in feveral of his plays, particularly in his Frogs and his Thesmophosiazulæ. He wrote his Peace in the 10th year of the Peloponnesian war, when a treaty for 50 years was concluded between the Athenians and the Lacedemonians, though it continued but feven years. 'The Acharnenses was written after the death of Pericles and the loss of the battle in Sicily, in order to disfuade the people from intruiting the fafety of the commonwealth to fuch imprudent generals as Lamachus. Soon after, he represented his Aves or Birds; by which he admonshed the Athenians to fortify Decelaa, which he calls by a fictitions name Nephelococcygia. Vespæ, or Wasps, was written after another loss in Sicily, which the Athenians fuffered from the misconduct of Chares. He wrote the Lyfistrata when all Greece was involved in a war; in which comedy the women are introduced debating upon the affairs of the commonwealth; when they come to a refolution, not to go to bed with their hulbands till a peace should be concluded. His Plutus, and other comedies of that kind, were written after the magistrates had given orders that no person should be exposed by name upon the stage. He invented a peculiar kind of verse, which was called by his name, and is mentioned by Cicero in his Brutus; and Suidas fays, that he also was the inventor of the tetrameter and octameter verse.

> Arlftophanes was greatly admired among the ancients, especially for the true Attic elegance of his flyle. The time of his death is unknown; but it is certain he was living after the expulsion of the tyrants by Thrafybulus, whom he mentions in his Plutus and other comedies. There have been several editions and translations of this poet. Nicodemus Frischin, a German, famous for his classical knowledge, in the 16th century, translated Plutus, the Clouds, the Frogs, the Equites, and the Acharnenfes, into Latin verse. Quintus Septimus Florens. rendered into Latin verse the Wasps, the Peace, and Lysistrata; but his translation is full of obfolete words and phrases. Madame Dacier published at Paus in 1692, a French version of Plutus and the Clouds, with critical notes, and an examination of them according to the rules of the theatre. Mr Lewis Theobald likewife translated these two comedies into English, and published them with remarks. The most noble edition of this author is that published hy Ludolphus Kuster, at Amsterdam, in folio, in 1710, and dedicated to Charles Montague earl of Halifax.

> ARISTOTELIA, in antiquity, annual feaths celebrated by the citizens of Stagyra, in honour of Aristocle, who was born there; and in gratitude for his having procured from Alexander the rebuilding and repeopling of that city, which had been demolished by King Philip.

> ARISTOTELIAN, fomething that relates to the philosopher Ariflotle.

> ARISTOTELIAN Philosophy, the philosophy taught by Aristotle, and maintained by his followers. The A-

ristotelian is otherwise called the Peripatetic Philosophy. See Peripatetics.

ARISTOTELIANS, a fect of philosophers, other- Arithoth

wife called Peripateties.

The Aristotelians and their dogmata prevailed for a long while in the schools and universities; even in spite of all the efforts of the Cartefians, Newtonians, and other corpufcularians. But the systems of the latter have at length gained the pre-eminence; and the Newtonian philosophy in particular is now very generally received. The principles of Aristotle's philosophy, the learned agree, are chiefly laid down in the four books de Calo; the eight books of Physical Auscultation, Purium augentus, belonging rather to logic, or metaphysics, than to physics. Instead of the more ancient fystems, he introduced matter, form, and privation, as the principles of all things; but he does not feem to have derived much benefit from them in natural philosophy. His doctrines are, for the most part, so obscurely expressed, that it has not yet been satisfactorily ascertained what were his sentiments on some of the most important subjects. He attempted to resute the Pythagorean doctrine concerning the twofold motion of the earth; and pretended to demonstrate, that the matter of the heavens is ungenerated, incorruptible, and subject to no alteration : and he supposed that the flars were carried round the earth in folid orbs. The reader will find a diffinct acount of the logical part of his philosophy, by Dr Reid professor of moral philosophy in the university of Glasgow, and in the second volume of Lord Kames's Sketches of the History of Man; and Mr Harris has published a sensible commentary on his Categories, under the title of Phileses phical Arrangements.

ARISTOTLE, the chief of the Peripatetic philosophers, born at Stagyra, a small city in Macedon, in the 99th Olympiad, about 384 years before the birth of Christ. He was the son of Nicomachus, physician to Amyntas the grandfather of Alexander the Great. He lost his parents in his infancy; and Proxenes, a friend of his father's, who had the care of his education, taking but little notice of him, he quitted his studies, and gave himself up to the follies of youth. After he had spent most of his patrimony, he entered into the army: but not succeeding in this profession, he went to Delphos to confult the oracle what course of life he should follow; when he was advised to go to Athens and study philosophy. He accordingly went thither about 18 years of age, and studied under Plato till he was 37. By this time he had fpent his whole fortune; and we are told that he got his living by felling powders, and some receipts in pharmacy. He followed his studies with most extraordinary diligence, so that he foon furpaffed all in Plato's school. little, and slept less; and that he might not over-sleep himself, Diogenes Laërtins tells us, that he lay always with one hand out of the bed, having a ball of brafs in it, which, by its falling into a bason of the same metal, awaked him. We are told, that Ariflotle had feveral conferences with a learned Jew at Athens, and that by this means he instructed lumfelf in the sciences and religion of the Egyptians, and thereby faved himself the trouble of travelling into Egypt. When he had studied about 15 years under Plato, he began 285

flowers come out fingly at every leaf, toward the up-They are of a purplish black per part of the stalk. colour; and are frequently succeeded by oval feed-veffels having fix cells full of flat feeds. 2. The longa, is a native of the fame countries. This species hath long tup-roots like carrots; the branches are weak and trailing, extending little more than a foot; the flowers come out from the wings of the leaves like the other, arc of a pale purple colour, and are frequently succeeded by feed veffels like the other. 3. The serpentaria, is a native of Virginia and Carolina, from whence the radix ferpentaria, or fnake-root, so much used in medicine, is brought over. The plant rifes out of the ground in one, two, and sometimes three pliant stalks, which at every little distance are crooked or undulated. The leaves stand alternately, and are about three inches long, in form somewhat like the smilax aspera. The leaves grow close to the ground on footitalks an inch long, of a fingular shape, and of a dark purple colour. A round canulated capfule succeeds the flower. It is filled with feeds, which are ripe in May. The ufual price of the root when dried is 6d. per pound, both in Virginia and Carolina, which is money hardly earned; yet the negro flaves employ great part of the time allowed them by their mafters in fearch of it, which is the reason that there are seldom found any but very small plants of this species. When they are planted in gardens in those countries where they are natives, the plants increase so much in two years time, that the hand can scarce grasp the stalks of a single one. This species delights in woods, and is usually found near the roots of great trees. 4. The indica, or contrayerva of Jamaica, is a native of that island, where its roots are used instead of the true contraverva. It hath long trailing branches, which climb upon the neighbouring plants, and sometimes rise to a considerable height. The flowers are produced in small clusters towards the upper part of the stalks, which are of a dark purple colour. 5. The clematitis, with heart-shaped leaves, an upright stem, with the flowers crowded in the axillæ. The root is long and flender.

Culture. The first, second, and third forts are propagated from feeds, which should be fown in the autumn, in pots filled with light freth earth, and placed under a frame to preserve them from the frost. If they are plunged into a gentle hot bed in the month of March, the plants will come up the fooner. In fummer, and in autumn when the stalks begin to decay, they must be watered. In winter they must be again sheltered; and in March before the roots begin to shoot, they must be transplanted into small separate pots filled with light earth, when they may be removed into the open air, and treated as before. The next fpring they may be planted in the open air in a warm border; where, in the autumn, when their stalks decay, if the border is covered with old tanners bark to keep out the frost, the roots will be secured; but where this care is not taken, they will frequently be killed by the frost. The fourth is tender; and therefore must be kept in a flove during the winter, or it will not live in England.

Medicinal uses. The roots of the long and round forts, on being first chewed, scarce discover any taste, but in a little time prove nauseously bitterish; the long somewhat the least so. The root of the clematitis is long and flender, rarely exceeding the thickness of a

goofe-quill; it inftantly fills the mouth with an aro- Annomematic bitterness, which is not ungrateful. Their medical virtues are, to heat, stimulate, attenuate viscid Aristophaphlegm, and promote the fluid fecretions in general: they are principally celebrated in suppressions of female evacuations. The dose in substance is from a feruple to two drachms. The long fort is recommended externally for cleaning and drying wounds and ulcers, and in cutaneous diseases.

The root of the serpentaria is small, light, bushy, and confifts of a number of strings or fibres, matted together, issuing from one common head; of a brownish colour on the outfide, and paler or yellowish within. It has an aromatic finell, like that of valerian, but more agreeable; and a warm, bitterish, pungent taste. This root is a warm diaphoretic and diuretic; it has been greatly celebrated as an alexipharmic, and efteemed one of the principal remedies in malignant fevers and epidemic diseases. In these intentions, it is given in substance from 10 to 30 grains; and in insusion, to a drachm or two. Both watery and spirituous menstrua extract its virtue by infusion, and elevate some share of its flavour in diffillation; along with the water a fmall portion of effential oil arifes.

None of these articles, however, are now in so much efteem as formerly; and while all them are banished from the Pharmacopæia of the London College, the clematitis is alone retained in that of Edinburgh.

ARISTOMENES, a general of the Messenians, renowned for his valour and virtue. See MESSENIA.

ARISTOPHANES, a celebrated comic poet of Athens. He was cotemporary with Plato, Socrates, and Euripides; and most of his plays were written during the Peloponnesian war. His imagination was warm and lively, and his genius particularly turned to raillery. He had also great spirit and resolution; and was a declared enemy to flavery, and to all those who wanted to oppress their country. The Athenians suffered themselves in his time to be governed by men who had no other views than to make themselves masters of the commonwealth. Aristophanes exposed the defigns of these men, with great wit and severity, upon the stage. Cleon was the first whom he attacked, in his comedy of the Equites; and as there was not one of the comedians who would venture to personate a man of his great authority, Aristophanes played the character himself, and with so much success, that the Athenians obliged Cleon to pay a fine of five talents, which were given to the poet. He described the affairs of the Athenians in so exact a manner, that his comedies are a faithful history of that people. For this reason, when Dionysius king of Syracuse desired to learn the state and language of Athens, Plato sent him the comedies of Aristophanes, telling him, these were the best representations thereof. He wrote above 50 comedies; but there are only 11 extant which are perfect : these are, Plutus, the Clouds, the Frogs, E. quites, the Acharnenses, the Wasps, Peace, the Birds, the Ecclesiazuse or Female Orators, the Theimophospazusæ or Priestesses of Ceres, and Lysistrata. Clouds, which he wrote in ridicule of Socrates *, is * Sec the

the most celebrated of all his comedies. Madame Dacier article & tells us, she was so much charmed with this perform-crates. ance, that after the bad translated it, and read it over 200 times, it did not become the least tedious to her,

which

Aristoppus road under his burden, he bid him throw away all that was too much for him to carry. Horace mentions this fact in his third fatire of the fecond book:

Quid fimile isti Græcus Aristippus? qui servos projicere aurum In media justit Libya, quia tardius irent Propter onus segues.

Being asked, what things were most proper for children to be instructed in? he answered, " Those which might prove of the greatest advantage to them when they came to be men." Being reproached for going from Socrates to Dionysius, he replied, " That he went to Socrates when he wanted ferious inftruction, and to Dionysius for diversion." Having received money of Dionysius at the same time that Plato accepted a book only, and being reproached for it, "The reason is plain (fays he) I want money, and Plato wants books." Having loft a confiderable farm, he faid to one who feemed excessively to compassionate his loss, "You have but one field; I have three left: why should not I rather grieve for you?" Plutarch, who relates this in his book, De Tranquillitate Animi, observes upon it, that it is very abfurd to lament for what is loft, and not to rejoice for what is left. When a person told him, "That the land for his fake was loft," he replied "That it was better fo, than that he should be lost for the land." Being cast by shipwreck ashore on the island of Rhodes, and perceiving mathematical schemes and diagrams drawn upon the ground, he faid, " Courage, friends; for I fee the footsteps of men."

After he had lived a long time with Dionysius, his daughter Arete fent to him, to defire his presence at Cyrene, in order to take care of her affairs, fince the was in danger of being oppressed by the magistrates. But he fell fick in his return home, and died at Lipara, an Eolian island. With regard to his principal opinions; like Socrates, he rejected the sciences as they were then taught, and pretended that logic alone was fufficient to teach truth and fix its bounds. He afferted, that pleafure and pain were the criterions by which we were to be determined; that thefe alone made up all our passions; that the first produced all the soft emotions, and the latter all the violent ones. The afsemblage of all pleasure, he afferted, made true happiness, and that the best way to attain this was to enjoy the present moments. He wrote a great many books: particularly the history of Libya, dedicated to Dionyfins; feveral Dialogues; and four books of the Luxury of the ancients. There are four epiftles of his extant in the Socratic collection published by Leo Allatius.

Besides Arete his daughter, whom he educated in philosophy, Aristippus had also a son, whom he disinherited for his stupidity. Arete had a son who was named Aristippus from his grandsather, and had the surname of Marzedidantes from his mother's instructing him in philosophy. Among his auditors, besides his daughter Arete, we have an account of Ethiops of Ptolemais, and Antipater of Cyrene. Arete communicated the philosophy which she received from her father to her son Aristippus, who transmitted it to Theodorus the Atheist, who instituted the section ealled Theodorean. Antipater communicated the philosophy of Aristippus to Epitimedes his disciple; E.

pitimedes to Paræbates; Paræbates to Hegesias and Anniceris: and these two last improving it by some additions of their own, obtained the honour each of them of giving a name to the Hegesiac and Annicerian sect.

Laertius mentions two other persons of the name of Aristippus; one who wrote the History of Arcadia; the other a philosopher of the New Academy.

ARISTO, a Stoic philosopher, the disciple of Zeno the chief of the Stoics, flourished about 290 years before the Christian era. He differed but little from his master Zeno. He rejected logic as of no use, and natural philosophy as being above the reach of the human understanding. It is said, that being bald, the fun burnt his head; and that this caused 15 death .-There is a faying of his recorded, which might render the doctrine of Aritippus less odious than it ordinarily is; (fee ARISTIPPUS). He used to say, " That a philosopher might do those of his hearers a prejudice who put a wrong interpretation upon good meanings: as for example that the school of Aristippus might fend out debauchees, and that of Zeno Cynics:" which feens to imply, that the doctrine of this philosopher never produced this effect but when it was misunderstood. He should also have added, that every teacher is therefore obliged to forbear laying down ambiguous maxims, or to prevent false glosses being put upon them.

ARISTO (Titus), a Roman lawyer, perfect master of the public and civil law, of history and antiquity. The Pandects mention some books of his, as does Aulus Gellius. He was contemporary with Pliny the younger, who gives him a noble character, and had a most tender friendship for him. See Plinii Epist. Lib. I. Ep. 22.

ARISTOCRACY, a form of government where the supreme power is vested in the principal persons of the state. The word is derived from agires, optimus, and xparin, impero, "I govern." The ancient writers of politics preser the aristocratical form of government to all others. The republic of Venice is an aristocracy. Aristocracy seems to coincide with oligarchy; which however, is more ordinarily used to signify a corruption of an aristocratical state, where the administration is in the hands of too sew, or where some one or two usurp the whole power.

ARISTOGITON, a famous Athenian, who, with Harmodius, killed Hipparchus tyrant of Athens, about 513 years before the Christian æra. The Athenians erected a statue to him.

ARISTOLOCHIA, BIRTHWORT: A genus of the hexandria order, belonging to the gynandria class of plants; and in the natural method ranking under the 11th order, Sarmentacea. It has no calyx; the corolla confifts of one entire petal; and the capfule, which is below the flower, has fix cells. The species are 21; but only the five following merit description. 1. The rotunda is a native of the fouth of France, of Spain, and Italy, from whence the roots are brought for medicinal use. The roots are roundish, grow to the fize of small turnips, being in shape and colour like the roots of cyclamens, which are frequently fold inflead of them. This fort hath three or four weak trailing branches, which lie on the ground when they are not supported, and extend two feet in length; the leaves are heart-shaped and rounded at their extremity; the

Ariftolochia-

He that with tyrants facks for bare support, Asiaippus. Enflaves himself, though free he came to court;

he immediately answered,

He is no slave, if he be free to come.

Diocles, as Lacrtius informs us, related this in his Lives of the Philosophers; though others ascribe this saying to Plato. Aristippus had a contest with Antisthenes the Cynic philosopher; notwithstanding which, he was very ready to employ his interest at court for some friends of Antilthenes, to preserve them from death, as we find by a letter of his to that philosopher. Diogenes followed the example of his mafter Antifthenes in ridiculing Aristippus, and called him the court

We have many apophthegms of his preferved. Suidas observes, that he surpaised all the philosophers in the acutenels of his apophthegms. Being once tailed at, he left the room; and the person who abused him, sollowing him, and asking him why he went away, he anfwered, " Because it is in your power to rail, but it is not in my power not to hear you." A person observing, that the philosophers frequented the houses of rich men; " Why (fays he), the phyticians frequent the chambers of the fick, yet that is no reason why a man should rather choose to be sick than be cured." To one who boaked of his great reading, he faid, " That as they who feed and exercise most are not always more healthy than they who only eat and exercise to satisfy nature; so neither they who read much, but they who read no more than is useful, are truly learned." Among other instructions which he gave to his daughter Aicte. he advised her particularly to despise superfluity. To one who asked him what his fon would be the better for being a scholar? " If for nothing else (said he), yet for this alone, that when he comes into the theatre. one stone will not fit upon another." When a certain person recommended his fon to him, he demanded 500 drachmas; and upon the father's replying, that he could buy a flave for that fum, " Do fo (faid he), and then you will be master of a couple." Being reproached, because, having a suit of law depending, he fee'd a lawyer to plead for him, " Just so (faid he), when 1 have a great supper to make, I always hire a cook." Being asked what was the difference between a wrice man and a fool, he replied, " Send both of them together naked to those who are acquainted with neither of them, and then you will know." Being reproved by a certain person (who, according to Mr Stanley, was Plato) for his costly and voluptuous feasts, " I warrant you faid he), that you would not have bestowed three farthings upon such a dinner;" which the other confeffing, " Why, then (faid he), I find myfelf lefs indulgent to my palate than you are to your covetous humour ;" or, as it is otherwise represented, " I find, that I love my belly, and you love your money." When Simus, treasurer to Dionysius, showed him his house magnificently furnished, and paved with costly marble. (for he was a Phrygian, and consequently profuse); Andlippus spit in his face: upon which the other growing angry, "Why, truly (faid he), I could not find a fitter place." His fervant carrying after him a great weight of money, and being ready to fink upon the Nn2

course which we find in Xenophon. Here Aristippus became acquainted with Lais, the famous courtezan of Corinth: for whose sake he took a voyage to that city. He continued at Agina till the death of Socrates, as appears from Plato's Phado, and the epittle which he wrote upon that occasion. He returned at into his own country Cyrene, where he professed philosophy, and instituted a sect which, as we observed above, was called the Cyrenaic, from the place, and by Some writers the Hedonic or voluptuous, from its doctrines. During the height of the grandeur of Dionyfius the Sicilian tyrant, a great many philosophers reforted to him; and among the rest Aristippus, who was tempted thither by the magnificence of that court. Dionysius asking him the reason of his coming, he replied, "That it was in order to give what he had, and to receive what he had not:" or, as others reprefent it, " That when he wanted wisdom, he went to Socrates; but now as he wanted money, he was come to him." He very foon infinuated himself into the favour of Dionysius; for being a man of a soft easy temper, he conformed himself exactly to every place, time, and person, and was a complete master of the most refined complaisance.

We have feveral remarkable passages concerning him during his relidence at that court mentioned by Diogence Lacrtius. Dionyfius, at a feast, commanded that all should put on women's purple habits, and dance in them. But Plato refused, repeating these lines:

I cannot in this gay effeminate drefa Difgrace my manhood or my fex betray.

But Aristippus readily submitted to the command, and made this reply immediately:

· At feasts, where mirth is free, A fober mind can never be corrupted.

At another time, interceding with Dionysius in behalf of a friend, but not prevailing, he cast himself at his feet: being reproved by one for that excels of humility, he replied, " That it was not he who was the cause of that submission; but Dionysius, whose cars were in his feet." Dionysius showed him three beautiful courtezans, and ordered him to take his choice. Upon which he took them all three away with him, alleging that Paris was punished for preferring one to the other two: but when he had brought them to his door, he difmiffed them, in order to show that he could either enjoy or reject with the same indifference. Having desired money of Dionysius, the latter observed to him, that he had affured him a wife man wanted nothing. " Give use (fays he) what I ask, and we will talk of that afterwards." When Dionysius had given it him, " Now (fays he), you fee I do not want." By this complaifance he gained so much upon Dionysius, that he had a greater regard for him than for all the rest of the philo-Sophers, though he sometimes spoke with such freedom to that king, that he incurred his displeasure. When Dionysius asked, Why philosophers haunted the gates of rich men, but not rich men those of philosophers: he replied, " Because the latter know what they want, and the others not." Another time, Dion Mius repeating (out of Sophocles, as Plutarch affirms, who Moribes this to Zeno) these verses,

Arifba Lriffides. of it is a bank, where they fish for pearls. E. Long. 80. 25. N. Lat. 8. 42.

ARISBA (anc. geog.), a town of the island of Lesbos (Herodot,)-Another of Tross on the continent, in the territory and to the fouth-east of Abydos (Polyb.): the rendezvous of Alexander's army after the passage of the Hellespont (Arrian); a colony of the Mitylenians (Stephanus); taken and plundered by Achilles (Virgil). The residence of Axylus, celebrated by Homer for his hospitality, which gained him the character of Friend of Mankind.

ARISH, a Persian long measure, containing about 48 English inches.

ARISI, the Indian name for the plant which produces the rice. See ORYZA.

ARISTA, or AWN, among botanists, a long needlelike heard, which stands out from the hulk of a grain

of corn, grafs, &c.

ARISTÆUS, fon of Apollo and Cyrene, whom for the many services he had rendered to mankind by his knowledge of all profitable arts, the gods placed amongst the stars; so that he is the Aquarius in the zodiac. The refemblance of his history to that of Mofes has been curiously discussed by Huetius.

ARISTANDER, a famous foothfayer under Alexander the Great, over whom he gained a wonderful influence by the good fuccess of his art. He had already had the same employment at the court of King Philip; and it was he who explained better than his brethren the dream that this prince had after having

married Olympias.

ARISTARCHUS, a Grecian philosopher of Samos, one of the first that maintained that the earth turns upon its own centre. We are not fure of the age in which he lived; and have none of his works but a Treatife of the greatness and distance of the Sun and Moon, translated into Latin by Frederic Commandine, and published with Pappus's explanations in 1572.

ARISTARCHUS, a celebrated grammarian, much e-Reemed by Ptolemy Philometor, who committed to him the education of his son. He applied himself eliefly to criticism, and made a revisal of Homer's poems but in too magisterial a way; for such verses as he did not like he treated as spurious. He commented on other poets. Cicero and Horace made use of his name to express a very rigid critic.

ARISTIDA, in botany: A genus of the triandria digynia class; and, in the natural method, ranking under the 4th order, Gramina. The calyx has a double valve; the corolla has one valve, and three awas at the points. There are three species of ariftida, viz. the adscensionis, a native of the island of Ascension; the Americana, a native of Jamaica; and the plumofa, a

native of America.

ARISTIDES, furnamed the Juft, flourished at Athens at the same time with Themistocles, who triumphed over him by his boifterous eloquence, and got him banished, 483 years before Christ, (See OSTRA-CISM): but Aristides being recalled a short time after, would never join with the enemies of Themistocles to get him banished; for nothing could make him deviate from the strictest rules of moderation and justice. Aristides brought the Greeks to unite against the Perfians; diffinguished himself at the famous battle of Marathon, and that of Salamis and Platza; and effablished an annual income of 460 talents for a fund to Aristica supply the expences of war. This great man died to Aristippe poor, though he had the management of the revenues of Greece, that the state was obliged to pay his funeral expenses, to give fortunes to his daughters in marriage, and a maintenance to his fon Lytimachus.

ARISTIDES of Miletus, a famous Greek author,

often cited by the ancients.

ARISTIDES, a very eloquent Athenian orator, who became a convert to the Christian religion, and about the year 124 presented to the emperor Adrian an apology for the Christians.

ARISTIDES (Alius), a celebrated orator, born in Mysia, about 129 years before the Christian era. The best edition of his works is that of Oxford, printed in

Greek and Latin, in two volumes quarto.

ARISTIBES, a painter cotemporary with Apelles, flourished at Thebes about the 122d Olympiad. He was the first, according to Pliny, who expressed character and passion, the human mind, and its several emotions; but he was not remarkable for foftness of colouring. " His most celebrated picture was of an infant (on the taking of a town) at the mother's breaft, who is wounded and expiring. The fentations of the mother were clearly marked, and her fear left the child, upon failure of the milk, should suck her blood." "Alexander the Great (continues the same author) took this picture with him to Pella."

Junius (in his Treatise de Pictura Veterum) conjectures that the following beautiful epigram of Æmili-

anus was written on this exquisite picture:

Exxi, tudes, rage untros er un tri macer amideus Ехично интетнет черов ката фВірачись. Η δη γας ξιφιεσσι λιποπτοος αλλα τα μιητρος Фідтен жиі віз ніду живохорыя вравот.

Elegantly trauflated thus:

Suck, little wretch, while yet thy mother lives, Suck the last drop her fainting bosom gives ! She dies! her tendernels survives her breath, And her fond love is provident in death. Webb's Inquiry, Dial. VII. p. 161.

ARISTIPPUS, the founder of the Cyrennic feet of philosophy, was the fon of Aretades, and born at Cyrene in Libya. He flourished about the 96th Olympiad. The great reputation of Socrates induced him to leave his own country, and remove to Athens, that he might have the fatisfaction of hearing his discourses. He was chiefly delighted with those discourses of Socrates that related the most to pleasure: which he asferted to be the ultimate end in which all happiness consists. His manner of life was agreeable to his opimion; for he indulged himself extremely in all the luxuries of drefs, wine, and women. Though he had a good estate, and three country seats, yet he was the only one of the disciples of Socrates who took money for teaching; which being observed by the philosopher, he asked Aristippus, How he came to have so much? Who in reply asked him, How he came to have so little? Upon his leaving Sociates, he went to Ægina, as Athenaus informs us, where he lived with more freedom and luxury than before. Socrates fent frequent exhortations to him, in order to reclaim him; but all in vain; and with the same view he published that disand Petrarch did before him, and our own Milton fince *, that his father banished him from the Muses. At the age of 24, Ariosto lost his father, and found himself perplexed with family affairs. However, in about fix years he was, for his good parts, taken into the fervice of Don Hippolito, cardinal of Este. At this time he had written nothing but a few fonnets; but now he resolved to make a poem, and chose Bayardo's Orlando Inamorato for a ground work. However, he was prevented writing for a great many years, and was chosen as a fit person to go on an embassy to Pope Julio II. where he gave fuch fatisfaction, that he was fent again, underwent many dangers and difficulties, and at his return was highly favoured. Then, at his leifure, he again applied himself to his poem : but, foon after, he incurred the cardinal's displeasure for refusing to accompany him into Hungary; by which he was fo discouraged, that he deferred writing for 14 years, even till the cardinal's death. After that, he finished by degrees, in great perfection, that which he began with great expectation. Duke Astolfo offered him great promotions if he would serve him; but preferring liberty to grandeur, he refused this and other great offers from princes and cardinals, particularly from Leo X. from all whom he received notwithflanding great presents. The duke of Ferrara delighted so much in his comedies, of which he wrote five, that he built a stage on purpose to have them played in his court, and enabled our poet to build himfelf a house in Ferrara, with a pleasant garden, where he used to compose his poems, which were highly effected by all the princes in Italy, who fent him many presents; but he said, "he would not sell his liberty for the best cardinal's hat in Rome." It was but a small, though convenient house: being asked, why he had not built it in a more magnificent manner, since he had given fuch noble descriptions of sumptuous palaces, beautiful

> Parva, sed apta mibi, sed nulli obnoxia, sed non Sordida, parta meo fed tamen ære, domue.

Which Mr Harrington thus translates:

This house is small, but fit for me, but hurtful unto none : But yet not fluttish, as you see, yet paid for with mine own.

porticos, and pleafant fountains, in his Orlando Furiofo?

he replied, That words were cheaper laid together than

flones. Upon the door was the following inscription :

In his diet he was temperate, and so careless of dainties, that he was fit to have lived in the world when they fed upon acorns. Whether he was ever married. is uncertain. He kept company with one Alexandria, to whom, it was reported, he was married privately, and a lady Genevera, whom he slily mentions in the 24th book of his Orlando, as poets are apt to intermix with their fictions some real amours of their own. He was urged to go ambassador to Pope Clement, but would by no means accept this embassy. He translated the Menecmi of Plauses: and all his own comedies were so esteemed, the hey were frequently acted by persons of the first quarty; and when his Lena was first represented, Ferdinand of Este, afterwards marquis of Massa, so far honoured the piece as to speak the prologue. He began one of his comedies in his father's lifetime, when the following incident shows the remarkable talent he had for poetry. His father one day rebuked him sharply, charging him with some Vol. II. Part 1.

great fault; but all the while he returned him no an-fwer. Soon after, his brother began on the same subject: but he easily refuted him, and, with strong arguments justified his own behaviour. " Why then (faid his brother) did you not fatisfy my father?" " In truth (faid Lodovico) I was thinking of a part in my comedy; and methought my father's speech to me was fo fuited to the part of an old man's chiding his fon, that I forgot I was concerned in it myself, and considered it only to make it a part of my play." It is also reported of Ariosto, that coming by a potter's shop, he heard him finging a stave out of his Orlando, with fo bad a grace, that, out of all patience, he broke with his flick feveral of his pots. The potter, in a pitiful tone, asking what he meant by wronging a poor man that had never injured him? "You rascal (he replied), I have not done thee half the wrong thou hast done me: for I have broken but two or three pots of thine, not worth fo many halfpence; whereas thou hast broken and mangled a stanza of mine worth a mark of gold."

Ariosto was tall, of a melancholy complexion, and so absorbed in study and meditation, that he often forgot himself. His picture was drawn by Titian in a masterly manner. He was honoured with the laurel by the hands of the emperor Charles V. He was naturally affable, always affuming less than was his due, yet never putting up a known injury, even from his superiors. He was so fearful on the water, that, whenever he went out of a ship, he would see others go before him; and, on land, he would alight from his horse on the least apprehension of danger. He was of an amorous dispofition, and left two natural fons. He enjoyed the friendship of the most eminent men of learning of his time, most of whom he mentions with great respect in the last canto of his Orlando Furioso. His constitution was but weakly, fo that he was obliged to have recourse to physicians the greatest part of his life. He bore his last sickness with great resolution and serenity; and died at Ferrara the 8th of July 1533, according to Sir John Harrington, being then 59 years of age. He was interred in the church of the Benedictine monks. who, contrary to their custom, attended his funeral. He had a buft erected to him, and the following epitaph, written by himself, inscribed upon his tomb :

Ludovici Ariosti humantur ossa Sub hoc marmore, feu fub hac humo, feu Sub quidquid voluit benignus hæres, Sive hærede benignior comes, seu Opportunius incidens viator: Nam scire haud potuit futura: sed nec Tanti erat, vacuam sibi cadaver Ut urnam cuperet parare. Vivens ista tamen sibi paravit, Quæ scribi voluit suo sepulchro. Olim si quod haberet id sepulchrum : Ne cum spiritus hoc brevi peracto Prescripto spatio misellos artus, Quos ægre ante reliquerat, reposcet, Hac et hac einerem huc et huc revellem Dum noscat proprium, diu vagetur,

ARIPO, a strong town of Asia, on the western coast of the island of Ceylon, at the mouth of the river Sarunda. It belongs to the Dutch; and to the east

Arimanius following account of the Magian traditions in relation to these gods, and the introduction of evil into the Arimathea. world, viz. That Oromazes confifted of most pure light, and Arimanius of darkness; and that they were at war with each other: that Oromazes created fix gods; the first, the author of benevolence; the second, of truth; the third, of justice, riches, and the pleafure which attends good actions; and that Arimanius made as many, who were the authors of the oppolite evils or vices: that then Oromazes, triplicating himfelf, removed as far from the fun as the fun is from the earth, and adorned the heaven with stars, appointing the dog star for their guardian and leader: that he alfo created 24 other gods, and enclosed them in an egg; but Arimanius having also made an equal number, these last perforated the egg, by which means evil and good became mixed together. However, the fatal time will come, when Arimanius, the introducer of plagues and famine, must be of necessity utterly destroyed by the former, and annihilated; then the earth being made plain and even, mankind shall live in a happy state, in the fame manner, in the fame political fociety, and using one and the same language. Theopompus writes, that, according to the Magians, the faid two gods, during the space of 3000 years, alternately conquer, and are conquered; that for other 3000 years, they will wage mutual war, fight, and deilroy the works of each other, till at last Hades (or the evil spirit) shall perish, and men become perfectly happy, their bodies needing no food, nor casting any shadow, i. e. being perfectly transparent.

> ARIMASPI, (Pliny), a people of Sarmatia Europea, to the fouth of the Montes Riphæi, said by Mela to have but one eye; a fable broached by Aristeas

Proconnessus, according to Herodotus.

ARIMATHEA, a town of Judea, (Evangelifts); thought to be the same with Ramatha, 1 Sam. i. and thus in the tribe of Ephraim, (Wells) .- This place is now called Ramla; and is in a very ruinous state, containing nothing but rubbish within its boundaries. The aga of Gaza resides here in a Serai, the floors and walls of which are tumbling down. He maintains about one hundred horsemen, and as many Barbary foldiers, who (fays Mr Volney) are lodged in an old Christian church, the nave of which is used as a stable, and in an ancient khan, which is disputed with them by the feorpions. The adjacent country is planted with lofty olive trees, disposed in quincunces. The greatest part of them are as large as the walnut trees of France; but they are daily perishing through age, the ravages of contending factions, and even from secret mischief: for, in these countries, when a peasant would revenge himself of his enemy, he comes by night, and saws or cut his trees close to the ground, and the wound, which he takes care to cover, draining off the fap like an issue, the olive tree languishes and dies. Amid thefe plantations, we meet, at every step, with dry wells, eisterns fallen in, and vast vaulted reservoirs, which prove that, in ancient times, this town must have been upwards of a league and a half in circumference. At present it scarcely contains two hundred families. The little land which is cultivated, by a few of them, belongs to the mufti, and two or three perfons related to him. The rest content themselves with spinning cotton, which is chiefly purchased by two

French houses established there. The only remarkable Asimi antiquity at Ramla is the minoret of a ruined mosque on the road to Yafa, which is very lofty; and by an Arabic infeription appears to have been built by the fultan Saladin.

ARIMINUM, a town of Umbria, or Romagna, at the mouth of the Ariminus, on the gulf of Venice. The feizing on it by Cæfar gave rife to the civil war. Now called Rimini. E. Long. 13. 30. Lat. 44. 8.

ARIOLI, in antiquity, a kind of prophets, or religious conjurers, who by abominable prayers, and horrible facrifices at the altars of idols, procured answers to their questions concerning future events. Ifid. Orig. Lib. VIII. cap. 9. These are also called barioli, and the operation bariolation. Sometimes they were denominated aruspices or haruspices. The arioli were distinguished by a flovenly drefs, diforderly and matted beards, hair, &c.

ARION, an excellent musician and poet, inventor of dithyrambics. Periander entertained him at his court, where getting an estate, and returning to Corinth, the failors, for lucre of his money, threw him into the fea; when, according to the poets, a dolphin, charmed with his music, took him on her back and carried him fafe to shore.

ARION, an admirable horse, much more samous in poetic history than Bucephalus in that of Alexander. Authors speak variously of his origin, though they agree in giving him a divine one. His production is most commonly ascribed to Neptune. This god, according to some, raised him out of the ground by a stroke of his trident: according to others, he begot him upon the body of the fury Erinnys; according to others, upon that of Ceres, whom he ravished in the form of a horse, the having previously assumed the form of a mare to elude his pursuit. This horse was nursed by the Nereids; and being fometimes yoked with the fea horses of Neptune to the chariot of this god, he drew him with incredible swiftness through the sea. He had this fingularity in him, that his right feet refemled those of a man. Neptune gave him to Capreus king of Haliartus. Capreus made a present of him to Hercules; who mounted him when he took the city of Elis, gained the prize with him in the race against Cygnus the fon of Mars near Træcena, and at last made a present of him to Adrastus. It is under this last master that Arion has signalized himself the most: he won the prize for racing at the Nemean games, which the princes who went to befiege Thebes instituted in the honour of Archemorus; and was the cause that Adrastus did not perish in this famous expedition as all the other chiefs did.

ARIOSTO (Lodovico), the famous Italian poet, and author of Orlando Furioso, was born at the castle of Reggio in Lombardy in 1474. His father, who was major domo to Duke Hercules, lived to the extent of his fortune, so left but little at his death. Ariofto, from his childhood, showed great marks of genius, especially in poetry; and wrote a comedy in verse on the story of Pyramus and Thisbe, which his brothers and fifters played. His father being utterly unlearned, and rather regarding profit than his fon's inclination, compelled him to fludy the civil law, in which having plodded some years to no purpose, he quitted it for more pleasing studies; yet often lamented, as Ovid

disciples; but he gave occasion after his death to the forming of a new Tystem of Arianism in Geneva, much more fubtle and artful than his own, and which did not a little perplex Calvin. From Geneva the new Arians removed to Poland, where they gained confiderable ground; but at length became Socinians.

The appellation Arian has been indifcriminately applied in more modern times, to all those who consider Jesus Christ as inferior and subordinate to the Father; and whose sentiments cannot be supposed to coincide exactly with those of the ancient Arians. Mr Whiston was one of the first divines who revived this controverfy, in the beginning of the 18th century. He was followed by Dr Clarke, who published his famous book, entitled The Scripture Doctrine of the Trinity, &c. In consequence of which, he was reproached with the title of Semi-Arian. He was also threatened by the convocation, and combated by argument. Dr Waterland, who has been charged with verging towards Tritheifm, was one of his principal adverfaries. The hiflory of this controverly during the prefent century, may be found in a pamphlet, entitled, An Account of all the considerable Books and Pamphlets that have been wrote on either Side, in the Controversy concerning the Trinity, from the Year 1712; in which is also contained an Account of the Pamphlets written this last Year, on each fide, by the Dissenters, to the End of the Year 1719. Published at London 1720.

ARICINA, in mythology, a furname of Diana; under which appellation she was honoured in the forest Aricine, so called from Aricia a princess of the blood royal of Athens. Hippolytus, to whom this princels was married, is faid to have erected a temple to Diana in this forest, where he was concealed after his refurrection by Esculapius, and to have established a

priest and festivals.

ARIUS MONTANUS, a learned Spanish divine, employed by Philip II. of Spain to publish another edition of the Bible, after that of Cardinal Ximenes; which he finished with applause, and died at Seville

in 1598.

ARICA, a port town of South America, in the province of Los Charcas, in Peru. It was formerly a confiderable place, but the carthquakes, which are frequent here, have almost entirely ruined it; for there are no more than 150 families, which are most of them blacks, mulattoes, and Indians. Most of the houses are made with canes or reeds, set upright, and bound together with cords or thongs; and as it never rains here, they are covered only with mats, which makes the place look at a distance like a heap of ruins.

The vale of Arica is about a league wide, and fix leagues long, next the fea, and is all a barren country, except the spot where the old town stood, which is divided into little meadows of clover grafs, and plots for fugar cases, with a few olive and cotton trees intermixed. This vale grows narrower as it runs eastward: and a legue up there is a village, where they begin to cultivate pimento or Jamaica pepper, which is planted throughout all the rest of the vale; and there are several farms, which produce nothing else, that bring in the value of 80,000 crowns yearly. The Spaniards of Peru are so used to this pepper, that they drefs no provisions without it. W. Long. 70. 15. S. Lat. 18. 26.

ARICONIUM, a town of the Silures, (Antonine); Ariconium now Hereford, (Cainden). W. Long. 2. 42. Lat. 52. 6.

ARIDAS, a kind of taffety, manufactured in the Arimanius. East Indies from a shining thread which is got from certain herbs, whence they are styled aridas of berbs.

ARIDULLAM, in natural history, a kind of zarnich found in the East Indies. See ZARNICH.

ARIES, in zoology. See Ovis.

ARIES, the battering ram. See BATTERING Ram. ARIES, in aftronomy, a conftellation of fixed flars, drawn on the globe, in the figure of a ram. It is the first of the twelve signs of the zodiac, from which a twelfth part of the ecliptic takes its denomination.

ARILLUS, an improper term invented by Linnæus, and defined to be the proper exterior coat or covering of the feed which falls off spontaneously.

All feeds are not furnished with an arillus; in many, a dry covering, or fearf skin, supplies its place. In jasmine; hound's tongue, cynoglossum; cucumber; fraxinella, dittamnus; staff tree, celastrus; spindle tree, euonymus; African spiran, diofma; and the coffee tree, coffea; it is very conspicuous.

In the genus hound's tongue, four of these arilli or proper coats, each enfolding a fingle feed, are affixed to the flylus; and in this circumstance, says Linnæus, does the effence of the genus confift. fraxine'i, the arillus is common to two feeds. The staff tree has its feeds only half involved with this

The arillus is either baccatus, succulent, and of the nature of a berry; as in the spindle tree, euonymus. Cartilagineus, cartilaginous, or griftly; as in the African spiræa, diosma. Coloratus, coloured; as in the staff tree. Elasticus, endued with elasticity, for difperfing the feeds; as is remarkable in the African spiræa, diofma, and fraxinella. Scaber, rough and knotty; as in hound's tongue.

Although covered with an arillus or other dry coat, feeds are faid to be naked (femina nuda) when they are not enclosed in any species of pericarpium or fruit veffel; as in the graffes, and the labiati or lipped flowers of Tournefort, which correspond to the didynamia gymnospermia of Linnaus. Seeds are faid to be covered (semina tella) when they are contained in a fruit veffel, whether capfule, pod, or pulpy pericarpium, of the apple, berry, or cherry kind : (See Semen). This exterior coat of the feed is, by some former writers, flyled calyptra. See CALYPTRA.

The different skins or coverings of the seed, are adapted, fay naturalists, for receiving the nutritive

juices, and transmitting them within.

ARIMANIUS, the evil god of the ancient Perfians. The Perfian Magi held two principles; a good demon, or god, and an evil one: the first the author of all good, and the other of all evil: the former they supposed to be represented by light, and the latter by darkness, as their truest symbols. The good principle they named Yezad or Yesdan, and Ormozd or Hormizda, which the Greeks wrote Oromasdes; and the evil demon they called Ahriman, and the Greeks Arimalius. Some of the Magians held both these principles to have been from all eternity; but this feet was reputed heterodox: the original doctrine being, that the good principle only was eternal, and the other created. -Plutarch (De Iside et Osiride, p. 369.) gives the

Arians.

ther with Ariadne; whom, however, he afterward for-

ARIADNIA, in antiquity. See ARIADNEA.

ARIT NA, (anc. geog.); an extensive country, comprifing Paropamifus, Arachofia, Drangiana, and Gedrofia, if we suppose it to reach to the sea. See ARIA.

ARIANNA, a fmall village fix miles N. E. from the city of Tunis. Here is a beautiful range of the ancient Carthaginian aqueduct, 74 feet high, supported by columns 16 feet square, and which still increased in grandeur the nearer it approached Carthage. The flones are all diamond cut. Near this fpot feveral ancient mattamones, or inhterraneous magazines for corn. have been discovered within these few years, capable of containing 100 buffiels, flrongly arched with large fquare stones. The Moors have already begun to demolish them, it being their custom to do so with every thing beautiful as foon as it comes to light.

ARIANO, a town of Italy, in the kingdom of Naples, in the Ulterior Principality, with a bishop's fee. Mr Swinburne describes it as an ugly city, built upon the uneven fummit of a mountain, with an extenfive look-out on all fides, but exposed to every blast that blows. It does not appear to be so old as the time of the Romans; therefore may be supposed to owe its rife to the demolition of fome neighbouring town, and to the advantages its fituation afforded for discovery and defence. It is but a poor place, without trade or manufactures; having declined ever fince the defolation caused by an earthquake in 1456. It reckons about 14,000 inhabitants, and no less than 20 parishes and convents, besides an ill endowed cathedral. The wine made here is pale, like red Champagne, which it also resembles in a certain tartness, exceedingly refreshing in hot weather. The foil lies upon a foft argillaceous stone. At a small distance to the east is a bank confishing of layers of volcanical earths, interspersed with thick strata of oyster shells.

Below the town is a convent of Dominicans, whose house, within these last hundred years, has been thrice rebuilt, having been as often thrown to the ground by earthquakes. The last and most destructive happened in 1732, fatal to all the country that lies along the eastern verge of the Appenines. In order to fecure a retreat in case of suture accidents, which from their situation they have every reason to expect, these fathers have constructed a small building of wood, the parts of which being joined together with strong iron chains, are contrived so as to have a proper play, and by yielding to the oscillatory motion of the earth, return easily to their equilibrium. E. Long. 15. 19. N. Lat. 41.8.

ARIANS, followers of Arius, a presbyter of the church of Alexandria about the year 315; who maintained, that the Son of God was totally and effentially distinct from the Father; that he was the first and noblest of those beings whom God had created, the instrument by whose subordinate operation he formed the universe; and therefore inferior to the Father both in nature and dignity: also, that the Holy Ghost was not God, but created by the power of the Son.

The Arians owned that the Son was the Word, but denied that Word to have been eternal. They held, that Christ had nothing of man in him but the flesh,

Ariadnia notaur, carried off the Athenians he had relieved, toge- to which the Aoyo; or Word was joined, which was the Ariadnia fame as the foul in us. See Lardner's Credibility, &c. Vol. IX. B. L. c. 69.

> The Arians were first condemned and anathematized by a council at Alexandria in 320, under Alexander, bishop of that city; who accused Arius of impiety, and caused him to be expelled from the communion of the church; and afterwards by 380 fathers in the general council of Nice, affembled by Conflantine in the year 325. But, notwithstanding that, it was not extinguished; on the contrary, it became the reigning religion, especially in the East, where it obtained much more than in the West. Arius was recalled from banishment by the emperor Constantine in two or three years after the council of Nice, and the laws that had been enacted against him were repealed. In the year 335, Athanasius, his zealous opponent, was deposed and banished into Gaul, and Arius and his followers were reinstated in their privileges, and received into the communion of the church. In little more than a year after this, he fell a victim to the refentment of his enemies, and died a tragical death, occasioned probably by poilon, or some other violence. The Arian party found a protector in Constantius, who succeeded his father in the empire of the East; and the zeal with which he abetted them produced many animolities and tumults to the time of his death in the year 362. They underwent various revolutions, perfecuting and oppressed, under succeeding emperors, according to the degree of interest they had in the civil power, till at length Theodosius the Great exerted every possible effort to suppress and disperse them.

> The Arians were divided into various sects, of which ancient writers give an account under the names of Semi-Arians, Eusebeans, Actians, Eunomians, Acacians, Pfathyrians, and others. But they have been commonly distributed into three classes, viz. the Genuine Arians, Semi-Arians, and Eunomians.

> Arianism was carried in the fifth century into Africa under the Vandals; and into Asia under the Goths; Italy, the Gauls, and Spain, were also deeply infected with it; and towards the commencement of the fixth century, it was triumphant in many parts of Afia, Africa, and Europe. But it funk almost all at once, when the Vandals were driven out of Africa, and the Goths out of Italy, by the arms of Justinian. However, it revived again in Italy under the protection of the Lombards in the feventh century.

> Erasmus seems to have aimed in some measure to restore Arianism at the beginning of the sixteenth century, in his Commentaries on the New Testament. Accordingly, he was reproached by his adversaries with Arian interpretations and glosses, Arian tenets, &c. To which he made little answer, save that there was no herely more thoroughly extinct than that of the Arians: Nulla berefis magis extintla quam Arianorum. But the face of things was foon changed. Servetus, a Spaniard by nation, published in 1531 a little treatile against the Trinity, which once more revived the opinions of the Arians in the West. Indeed he rather showed himself a Photinian than an Arian; only that he made use of the same passages of Scripture, and the same arguments against the divinity of our Saviour, with the proper Arians.

It is true, Servetus had not, properly speaking, any disciples;

R

dered him too powerful as the subject of a limited monarchy. He still possesses many royalties; his vassals, even of the name of Campbell, are so numerous, and his influence extends fo far, that he could, on occasion, bring 3000 or 4000 fighting men into the field. Argylishire is in general peopled by this clan; and affords a great number of castles and seats belonging to gentlethen who hold of the duke, and boast themselves de-Icended from his family.

Argyll Proper is bounded by Knapdale and Cowal on the fouth; Lochaber on the north; Lennox and the Grampian hills on the east; and Lorn on the west. It lies between Lochfyn and Lochow; which last is a fresh water lake, about a mile broad, but extending 24 in length, including 12 islands, on two of which there are the castles of Enconel and Glenurquhart. This lake, which gives the title of viscount to the duke of Argyll, issues in the river Aw, which, after a course of fix or seven miles, enters Loch Ettiff, and this falls into the west sea, opposite to the isle of Mull: all these abound with excellent trout and falmon. Argyllshire fends one member to parliament.

When the projected canal shall be completed, and fome villages and harbours erected, the populous county of Argyll (Mr Knox affirms) will become one of the most valuable provinces in the British empire. It abounds in black cattle, sheep, and sish, though the latter are less numerous than those on the more northern fhores. Washed on both sides by the sea, deeply indented by navigable lakes and bays; having an easy communication with the fishing grounds on the North Highlands; with Glasgow, and the trading towns on the Clyde; with Ireland, Wales, Whitehaven, Liverpool, Bristol, and other marts on the west coast of England, we may eafily conceive, that the period is at no great diffance, when Argyllshire will become a great commercial county. To corroborate this opinion, he observes, that after a vessel gets under fail from this coast, she enters at once into the Atlantic, where the meets with no interruption till the makes the coast of America or the West Indies. The line, therefore, which nature points out for the inhabitants, is that of falt making, fishing, ship building, freights, or the carrying trade; foap and glass making, by means

island, which is adapted for the latter. ARGYRASPIDES, or Argyroaspides; in antiquity, persons armed with filver bucklers, or bucklers filvered.

of the kelp upon their shores, and sand found upon Gia

The argyrafpides, according to Quintus Curtius, made the fecond corps of Alexander's army; the first was the phalanx .- According to Justin's account, Lib. XII. Cap. vii. Alexander having penetrated into India, and extended his empire as far as the ocean; for a monument of his glory, ordered the armour of his foldiers, and the houfings of his horfes, to be adorned with fil-And hence commanded them to be called argyraspider, from the Greek agyoges, silver, and works, buckler.

By this author it should seem, that Alexander's whole army were called argyraspides.-After that prince's death, the argyraspides despised all other chiefs of the army, disdaining to obey any other, having borne arms under Alexander.

ARGYRIPÆ. See Argos Hippium.

ARGYRUN'I'UM, a maritime town of Illyria Argyrub-(Ptolemy, Pliny). Now Novigrad, a town of Dalma-

Ariadae.

ARHUSEN, a diocese of North Jutland in Denmark, to the fouth of Wilburg, about 60 miles in length and 30 in breadth. It contains two capital cities, called Arhusen and Rander; besides several market towns of less note, and upwards of 300 villages. Arhusen, one of the capitals, is advantageously situated on the coast of the Baltic sea, at the mouth of the river Guda, which runs through it; and it is furrounded with forests full of game. E. Long. 10. o. W. Lat.

ARIA, one of the ancient names of Thrace, (Stephanus); that is martial, from the character of the people, whose country Euripides calls the residence of Mars, and Sophocles his place of nativity.

ARIA, and Ariana (anc. geog.), whether the same or distinct countries authors are not agreed. Ptolemy has only Aria, and knows nothing about Ariana. Pling mentions only Ariana, and fays nothing about Aria; but distinguishes between the Arii and Ariani: Parthia, he fays, has the Arii to the east, Caramania and the Ariani to the fouth; from which it is conjectured, the Ariani extended farther than the Arii, and comprifed the Gedrofii and the Drangæ. Arrian has only Aria and Arii, and is filent about Ariana. But Strabo gives more extensive bounds to Ariana than to Aria, without particularly defining them; only in general he fays, that Ariana begins from India, and quotes Eratosthenes; according to whom, Ariana is bounded by the Indus on the east; on the fouth by the Great Sea; by Paropamisus on the north, and by the mountains, quite to Portæ Cafpiæ; on the west by the same boundaries by which Parthia is feparated from Media, Caramania from Parætacene and Persia: and thus Ariana is extremely extensive.—Aria has its limits thus defcribed by Ptolemy: On the north, some parts of Margiana and Bactriana; on the east, the Paropamisidæ; on the fouth the Drangiana: and Strabo fays, the Arii adjoin to the Paropamisidæ on the west.

ARIA, called Ariapolis, (Strabo): Now Herat, in Chorasan, set down in an ancient map as situated on the river Arias, which probably gave name to the country Aria. Arrian calls the river Arcies; Pliny, Arius; Ammian, Arias: now Heri, which runs by Alexandria, also called Alexandria Arion or Ariorum.

ARIADNÆA, in Grecian antiquity, two festivals at Naxos, in honour of two women named Ariadne. One of them being the daughter of King Minos, they had, in the folemnity dedicated to her, a show of forrow and mourning; and, in memory of her being left by Theseus near the time of child-birth, it was usual for a young man to lie down and counterfeit all the agonies of a woman in labour. This festival is said to be first instituted by Theseus, to atone for his ingratitude to that princess.—The other Ariadne was thought to be of a gay and sprightly temper; and therefore her festival was observed with music and other expressions of mirth and joy.

ARIADNE, daughter of Minos king of Crete. Theseus being sent to destroy the Minotaur, Ariadne was fo taken with him, that, as a testimony of her love, the gave Thefeus a clue of thread to guide him out of the labyrinth. Thefeus, having killed the Mi-

Argulm there maintained themselves in spite of the utmost endeavours of the French Company to disposses them. Argutize. Numberless were the memorials, protests, rescripts, &c. which were published on this occasion, till a new war in 1701 put an end to them. In 1717, however, the French Company having found all their remonstrances ineffectual, fitted out a new squadron; but this armament did not arrive at Arguim before Feb. 26. 1721. The Dutch defended themselves with such intrepidity and conduct as had almost baffled the utmost efforts of the French; but the latter having found means to draw off a Moorish chief from his allegiance, the Dutch were obliged to evacuate Arguim, and retire to Portendic, where they fortified themselves, determining to watch a favourable opportunity for recovering their settlement This was not long wanting, by means of at Arguim. the weakness of the garrison and the imprudence of Duval the French director; who having quarrelled with the Moors, was surprised, defeated, and killed by them; in confequence of which, the fettlement fell again into the hands of the Dutch on the 11th of Jan. 1722. In 1723, the Dutch were attacked by another French fquadron under the command of the Sieur Riguadiere. This gentleman boasted that the fort could not hold out one day; but though he prevailed fo far as to get possession of the cisterns which contained the water of the belieged, he was at last shamefully repulsed, and forced to raife the fiege with precipitation. The Dutch however, did not long enjoy the possession which they had so bravely defended; for, in 1725, their fort was entirely demolished by the French under Du Casse, and has never fince been rebuilt by any European nation.

ARGUMENT, in rhetoric, and logic, an inference drawn from premifes, the truth of which is indifputable, or at least highly probable. SEE Logic.

ARGUMENT, in matters of literature, denotes also the abridgment or heads of a book, history, comedy, chapter &c. See SYLLABUS.

ARGUMENTATION, the act of inventing or framing arguments, of making inductions, and drawing conclusions. See Induction, &c.

Argumentation, according to Cicero, is the delivering or unfolding of an argument.-The matter of argumentations is propositions; the form, their due difposition, with regard to one another, so as a conclufion may be drawn from them. See ENTHYMEME, PROPOSITION, RATIOCINATION, SORITES, SYLLO-GISM. &c.

ARGUS, in fabulous history, was the son of Aristor, and had 100 eyes, 50 of which were always open. Juno made choice of him to guard Io, whom Jupiter had transformed into a white heifer, but Jupiter, pitying Io for being fo closely confined, fent Mercury, who, with his flute, charmed Argus to sleep, sealed up his eyes with his caduceus, and then cut off his head; when Juno, to reward his fidelity, turned him into a peacock, and placed his eyes in his tail.

Argus-shell, a species of porcelain shell, beautifully variegated with spots, resembling in some measure those in a peacock's tail.

ARGUTIÆ, witty and acute fayings, which commonly fignify fomething further than what their mere words at first fight feem to import. - Writers on rhetoric speak of divers species of argutiz, viz.

ARGUTIM ab aliene, when something is said, which

feems repugnant either to the nature and property of Arguita' a thing, or to common custom, the laws, &c. which yet in reality is confishent therewith; or when something is given as a reason of another, which yet is not the reason of it. For instance, Si Gaius nibil didicisset, erraffet minus; again, Aureum hoc faculum eft, quia plurimus jam auro honos venit.

Argutie ab allufione, those wherein allufion is made to some history, fable, sentence, proverb, or the like; c. g. Multi umbram captant et carnem amittunt.

Argutia à comparatis, when two things are compared together, which yet at first fight appear very different from each other, but so as to make a pretty kind of fimile or difimile; e. g. Par est pauper nil cupiens principi omnia habenti.

Argutia à repugnantibus, when two thing meet in a subject, which yet regularly cannot be therein; or when two things are opposed to each other, yet the epithet of the one is attributed to the other, e. g. Dum tacent clamant.

ARGYLL, (dukes of), See CAMPBELL.

ARGYLLSHIRE or ARGATHILIA, in Scotland. which, together with Perthshire and the Western Islands, is said to have constituted the ancient kingdom of the Scots, while the rest of Caledonia was subject to the Picts and Romans, comprehends Kintyre, Knapdale, Argyll Proper, Cowal and Lorn. It is bounded on the fouth by the Irish sea and the frith of Clyde; on the east, by Perthshire; on the north-east, by Lochaber; and on the north west, by several islands. The extent of it from fouth to north, between the Mull of Kintyre and the point of Ardnamurchan where it joins the thire of Inverness, is about 114 miles; and the breadth in some places, including the isles, 70. This country, like all other parts of the Highlands, affords a very wild and horrid prospect of hills, rocks, and huge mountains, piled upon each other in a finpendous and dreadful disorder; bare, bleak, and barren to the view; or at best covered with shagged heath, which appears black and difmal to the eye, except in the fummer, when it is variegated with an agreeable bloom of a purple colour. The coast of Argyll is rocky; yet indented with bays and inlets, that afford good harbours for shipping. The country is well watered by rivers, brooks, and lakes, abounding with fish : the vales and flat parts of it are cultivated for corn; the mountains feed an innumerable quantity of black cattle, which run wild among the hills in winter as well as fummer; the heath and woods, of which there is a confiderable number, afford shelter to deer, roebucks, and all forts of game in great plenty: the circumambient sea, with its locks, bays, and harbours, pours forth myriads of fish; but the innate wealth of the country is dug from the bowels of the mountains in iron, copper, lead, and other metals and minerals.

Argyll is the feat of a provincial fynod, confifting of five prefbyteries and 49 parishes; and gives the titles of duke and earl to the noble family of Campbell, the most powerful of all the Scottish nobility. The duke of Argyll is, by hereditary right, great master of the king's household in Scotland; admiral of the Western isles; general of Denoon castle; keeper of Dunstastnage and Carrick; and, before the jurisdictions were abolished, enjoyed other hereditary offices, which rencolor Argonaut knights came to be called knights of the shell. They received the order of St Basil, archbishop of Naples; and held their affemblies in the church of

St Nicholas, their patron.

ARGOPHYLLUM, WHITE LEAF (Forfl. Nov. Gen.): A genus of the morogynia order, belonging to the pentandria class of plants. The capsule is trilocular; the nectarium is pyramidal, pentagonous, and the length of the corolla. There is but one species, the nitidum or gloffy, a native of New Caledonia. This genus has great affinity with the ivy; but differs in the nectarium, and perhaps in the fruit.

ARGOS, an ancient name of Peloponnesus; from

Argos, one of the kings, (Homer, Strabo).

Argos, the capital, and an inland town, of Argolis or ARGEIA. It had different furnames ; as Achaicum, from the country, or an ancient people, (Homer); Hippium, from its breed of horses; and Inachium, from the river Inachus, which runs by, or from Inachus the founder of the kingdom, whose name was alfo given to the river. The Argives, related, that this was one of the river gods who adjudged the country to Juno, when the contended for it with Neptune, which deity in return made their water to vanish; the reason why the Inachus flowed only after rain, and was dry in fummer. The fource was a spring, not copious, on a mountain in Arcadia, and the river ferved there as a boundary between the Argives and Mantineans.

Ancient Argos stood chiefly on a flat. The springs were near the furface; and it abounded in wells, which were faid to have been invented by the daughters of This early personage lived in the acropolis or citadel, which was named Lariffa, and accounted moderately strong. On the ascent was a temple of Apollo on the ridge, which in the fecond century continued the feat of an oracle. The woman who prophefied was debarred from commerce with the male fex. A lamb was facrificed in the night monthly; when, on tasting of the blood, she became possessed with the divinity. Farther on was a stadium, where the Argives celebrated games in honour of Neméan Jupiter and of Juno. On the top was a temple of Jupiter, without a roof, the statue off the pedestal. In the temple of Minerva there, among other curious articles, was a wooden Jupiter, with an eye more than common, having one in the forchead. This statue, it was faid, was once placed in a court of the palace of Priam, who fled as a suppliant to the altar before it, when Troy was facked. In this city was also the brazen tower in which Danaë, being confined there by her father, was deflowered by Jupiter.

Argos retains its original name and fituation, standing near the mountains which are the boundary of the plain, with Napoli and the sea in view before it. The shining houses are whitened with lime or plaster. Churches, mud-built cottages and walls, with gardens open areas, are interspersed, and the town is of inderable extent. Above the other buildings towers than a most of the country handsome mosque shaded with solemn cypresses; and behind is a lofty hill, brown and naked, of a conical form, the fummit crowned with a neglected caftle. The devastations of time and war have effaced the old city. We look in vain (fays Mr Chandler) for vestiges of its numerous edifices, the theatre, the gymnafium, the temples, and monuments, which it once

boasted, contending even with Athens in antiquity and Argos. in favours conferred by the gods. Argos Amphilochicum, (Thucydides), a city of A-

carnania, (Scylax, Pliny); its territory Amphilochia: fituated on the east fide of the Sinus Ambracius, (Thucydides); diffant an hundred and eighty fladia to the fouth-east of Ambracia, (Polybius). Also called Argia Amphilochis, (Mela); Amphiloci and Amphilochici the people, (Stephanus). The name is from Amphilochus, fon of Amphiaraus; and from Argos, the name of his country, in Peloponnesus, ('Thucydides).

Argos Hippium. See Argos in Peloponnesus, fu-

Argos Hippium, the ancient name of Arpi; but Lampe is a still more ancient; afterwards called Argyrippa, and Argippa; built by, and the residence of, Diomedes, on the Cerbalus, (Virgil); afterwards a large and populous city, (Livy): A town of Apulia; now in ruins, and the place called Arpi.

Argos Pelafgicum, (Homer); an appellation denot-

ing Thessaly; so called from the Pelasgi.

Argos Perius, a port of Tuscany, (Strabo): now Porto Ferraro, in the north of the island Elba. E.

Long. 11. 30. Lat. 42. 35.

ARGUIM, an island on the coast of Africa, about fixteen miles distant from Cape Blanco, fit sated in W. Long. 16. 30. N. Lat. 20. 20. It is fearce two miles in length; notwithstanding which, it was a bone of contention for 87 years between the Portuguese, Dutch, English, and French; and, after a variety of fortune,

has at last been totally abandoned.

This island was first discovered by the Portuguese in 1444, when a fleet bound to the east touched at Arguin, and from some little trade carried on with the natives, it was imagined that a fettlement there might be of some advantage to Portugal. In consequence of this opinion, a fort was erected on the island, and the Portuguese enjoyed the peaceable possession of it till 1638. At this time, the Dutch having received a minute account of the condition of the island, resolved to attack it; and accordingly landed without moleftation from the garrison, which was too weak to oppose them. The Portuguese, however, defended themselves with great intrepidity, and at last furrendered upon honourable terms. The Dutch immediately fet about repairing the fortifications, and fecuring it in the best manner they could: however, in 1665, the fort was reduced almost to a heap of rubbish by an English squadron; but as the fortifications were totally destroyed, and only a small garrison left there, it was easily retaken by the Dutch the next year. They now redoubled their diligence in strengthening the island, entering into alliance with Moorish chiefs, procuring a number of families to settle under protection of the fort, and giving extravagant prices for gums, in order to monopolize the gum trade. By this means the gum trade of the French Senegal Company was almost entirely destroyed; upon which they fitted out a squadron, dispossessed the Dutch, and had the island finally ceded to them by the treaty of Nimeguen.

Though the Dutch now seemed to be finally expelled, they resolved not to part so easily with such a valuable settlement. Under pretence of being subjects of the elector of Brandenburg, therefore, they erected one of the forts which had been demolished, and Argonauti-

ARGONAUTICA, in literary history, denotes poems on the subject and expeditions of the Argonauts. Argonauts. We have the Argonautics of Orpheus in epic verse, published by H. Stephens; the Argonauticon of Valerius Flaccus, in eight books of Latin heroics, in imitation of Apollonius, with respect to which Burman observes that the imitator has often surpassed the original; the Argonautics of Apollonius Rhodius, an herole poem, confifting of four books, opus, as Quintilian calls it, non contemnendum.

ARGONAU'I'S, in antiquity, a company of illuftrious Greeks, who embarked along with Jason, in the ship Argo, from Colchis, with a design to obtain

the golden fleece.

The occasion of this expedition is thus represented by Greek writers. Phryxus, flying with his fifter Helle from the rage of their stepmother Ino. the daughter of Cadmus, went on board a ship, whose entign was a golden ram, and failed to Colchis (now, Mingrelia, part of Georgia). Helle was drowned by the way, in that sea which from her was called the Hellispont, now the Dardanelles. This, according to fome, was the ground of the poetical fable, that a ram with a golden fleece swam away with them to Colchis; and that the Argonauts undertook their famed expedition, in order to find that fleece. But Strabo and Arrian informs us, that it was a practice of the Colchians to collect gold on Mount Caucafus by extending fleenes across the beds of the torrents; and as the water passed, the metallic particles remained entangled in the wool: hence, according to those hiltorians, the adventure was named the expedition of the gold'n fleece. Sir Isaac Newton thinks that this expedition was really an embaffy fent by the Greeks, during the intelline divisions of Egypt in the reign of Amenophis, to perfuade the nations upon the coalts of the Euxine and Mediterranean feas, to take that opportunity of shaking off the yoke of Egypt, which Sefostris had laid upon them; and that fetching the golden fleece, was only a pretence to cover their true

But the most judicious and satisfactory account of the Argonautic expedition feems to be that given by Di Gillies in his hiftory of Greece. "The northern districts of Thessaly being peculiarly exposed to the dangerous fury of invaders, the petty princes of that province entered into a confederacy for their mutual defence. They affembled in fpring and autumn at Thermopyke, a place afterwards to illustrious, and then governed by Amphictyon, a descendant of Deucalion, whose name is immortalized in the Amphictyonic council. The advantages which the confederates derived from this measure, were soon perceived by their neighbours. The central states gradually acceded to their alliance; and about the middle of the fourteenth century before Christ, Acrisius king of Argos, and other princes of the Peloponnesus, were allowed to share the benefits and security of this useful association. See AmphicTyons.

"After this event, the Amphictyons appear to have long confined themselves to the original purpose of their inftitution. The states, whose measures were directed by this affembly found sufficient occupation in defending their own territories; and near a century elapfed, before they undertook, by common confent,

any distant expedition. But it was not to be expected Argonaul that their restless activity could be always exhausted in defensive war. The establishment of the Amphictyons brought together the chiefs most distinguished by birth and bravery. Glory and emulation prompted them to arms, and revenge directed those arms against the barbarians. Jason, Admetus, and other chieftans of Thesfaly, having equipped a small fleet in the neighbouring harbour of Ioleus, and particularly the ship Argo of fuperior fize and construction to any before known, were animated with a defire to vifit foreign lands, to plant colonies in those parts of them that appeared most delightful, and to retort on their inhabitants the injuries which Greece had suffered from strangers. The princes of the north having proclaimed this spirited defign over the central and fouthern provinces, the flandard of enterprise and glory was speedily surrounded by the flower of the Grecian youth, who eagerly embraced this honourable opportunity to figualize their manly valour. Peleus, Tydeus, Telamon, and in general the fathers of those heroic chiefs who in the succeeding age shone with distinguished lustre in the plains of Troy, are numbered among the leaders of the Argonauts. They were accompanied by the chofen warriors, and by the venerable prophets, of their respective tribes; by an Esculapius, the admired father of the healing art; and by the divine Orpheus, whose fublime genius was worthy to celebrate the amazing feries of their adventures.

"These adventures, however, have been too much adorned by the graces of poetry, to be the proper subject of historical composition. The designs of the Argonauts are veiled under the allegorical, or at least doubtful, phrase, of carrying off the golden fleece; which, though callly explained, if we admit the report that the inhabitants of the eastern banks of the Euxine extended fleeces of wool, in order to collect the golden particles which were carried down by the torrents from Mount Caucafus, is yet described in such various language by ancient writers, that almost every modern who examines the subject, thinks himself entitled to offer, by way of explanation, some new conjecture of his own. But in opposition to the most approved of these conjectures, we may venture to affirm, that the voyage to Colchis was not undertaken with a view to establish extensive plans of commerce, or to search for mines of gold, far less to learn the imaginary art of converting other substances into that precious metal; all fuch motives supposing a degree of speculation and refinement unknown in that age to the gallant but un-instructed youth of Thessaly. The real object of the expedition may be discovered by its consequences. The Argonauts fought, conquered, and plundered; they fettled a colony on the shores of the Euxine; and carried into Greece a daughter of the king of Colchis, the celebrated Medea, a princefs of Egyptian extraction, whose crimes and enchantments are condemned to eternal infamy in the immortal lines of Euripides."

ARGONAUTS of St Nicholas, was the name of a military order instituted by Charles III. king of Naples, in the year 1382, for the advancement of navigation, or, as some fay, merely for preserving amity among the nobles. They wore a collar of shells, enclosed in a filver crefcent, whence hung a thip with this device, Non crede tempori, " I do not trust time." Hence these

Argonaut

continue the tail is forked, and the lateral lines are straight. It inhabits the fresh waters of Carolina.

ARGENTINUS, a deity worshipped by the ancients, as the god of filver coin; as Æsculanus, whom they made his father, was the god of brass money, which was in use before filver.

ARGENTON, a town and county of France, in the duchy of Berry, divided into two by the river Creuse. Here was formerly a caltle; but it was demolished by Lewis XIV. E. Long. 1. 38. N. Lat. 40. 30.

ARGENTORA, Argentina, (Notitiz); Argentoratum, (Ptolemy); Argentoratus, (Ammian); a city of the Tribocci; one of the fifty forts built by Drusus on the Rhine, (Florus): an appellation formed by the Romans from the German, Argen Straffen, or Strafen, " unfafe roads for travellers," from the marauding Bee Straf Strafburg*, in Lower Alface, on the rivulet Ill, near the Rhine. E. Long. 7. 35. Lat. 48. 38. ARGENTUM. See Silver.

ARGENTUM Album, in our old customs, filver coin, or pieces of bullion that anciently passed for money. By Doomsday tenure, some rents to the king were paid in argenta albo, common filver pieces of money: other rents in libris ursis et pensatis, in metal of full weight and purity: in the next age, that rent which was paid in money, was called blanch fearm, and afterwards white rest; and what was paid in provisions, was termed black mail.

ARGENTUM Dei, God's penny, anciently fignified earnest money, or money given to bind a bargain; in some places called erles, or arles, and by the civilians and canonifts, arrhe. Et cepit de pradicto Henrico tres denarios de argenti Dei pre manibus.

ARGENTUM Museum is a mass consisting of silverlike flakes, used for the colouring of plaster figures, and for other purpoles, as pigment. It confilts of an amalgam of equal parts of tin, bilmuth, and mercury. It is to be mixed with white of eggs, or spirit varnish, and then applied to the intended work, which is afterwards to be burnished.

Argentum Vivum, Mercury, or Quickfilver. See MERCURY, and CHEMISTRY, Index.

ARGESTES, is used by Vitruvius for the wind which blows from that quarter of the horizon, which is 75° from the fouth and westward. Ricciolus uses the term to denote the wind which blows at 22° 90' from the west towards the north, coinciding with that which is otherwise called weft-north-weft.

ARGIL, in ornithology, a species of ardea. See

ARGILLA, clay, in natural history. See CLAY. ARGIVI, or ARGEII, the people of Argeia or Argolis. See ARGLIA.

ARGO, in antiquity, a ship or vessel celebrated among the poets; being that wherein the Argonauts, of whom Jason was the chief, made their expedition in quest of the golden sleece. Jason having happily accomplished his enterprise, consecrated the ship Argo to Neptune; or, as others fay, to Minerva, in the ifthmus of Corinth; where, they add, it did not remain long before it was translated into heaven, and made a constellation. The generality of authors represent the ship Argo as of a long make, resembling the modern galleys; and furnished with thirty benches of rowers. Vol. II. Part I.

It could not, however, be of any great bulk, fince the Argonauts were able to carry it on their backs from the Danube to the Adriatic sea.

Argo Navis, the Ship Argo, in astronomy, is a constellation in the southern hemisphere, whose stars, in Ptolemy's catalogue, are 45; in Tycho's 11; in the Britannic catalogue, and Sharp's Appendix,

ARGOB (anc. geog.), a canton lying beyond Jordan, in the half tribe of Manasseh, and in the country of Bashan, one of the most fruitful on the other side of Jordan. In the region of Argob there were fixty cities, called Bashan-havoth-jair, which had very high walls and strong gates, without reckoning many villages and hamlets which were not enclosed, Deut. 11i. 4. 14. and 1 Kings, iv. 13. But Argob was more particularly the name of the capital city of the region of Argob, which Eusebius says was fifteen miles west from Ge-

ARGONAUTA, the name of a genus of shell fish belonging to the order of vermes testacea. The shell confifts of one spiral involuted valve. There are two fpecies of argonauta, viz. The argo, with a fubdented carina, which is found in the Mediterranean and Indian oceans. This is the famous nautilus of authors. The shell seems no thicker nor stronger than a piece of paper; and the fish that inhabits it is a sepia. It has been imagined that men first learned the method of failing in vessels from what they saw practised by this creature. When it is to fail it extends two of its arm. See Plate on high; and between these supports a membrane, LVL which it throws out on this occasion: this ferves for its fail; and the two other arms it hangs out of the shell, to ferve occasionally either as oars or as a steerage; but this last office is generally served by the rail. When the fea is calm, it is common to fee numbers of these creatures diverting themselves with failing about in this manner; but as foon as a ftorm rifes, or any thing gives them disturbance, they draw in their legs, and take in as much water as makes them fomewhat heavier than the fea water in which they fwim, and they then fink to the bottom. The manner of their voiding this abundant water, when they would rife again, is by a number of holes, of which their legs are full. 2. The cymbium, with a blunt plaited carina. This species is very small, and is found in the Mediterra-

ARGONAUTIC, fomething belonging to the Argonauts.

The Argonautic expedition is one of the greatest epochas or periods of history which Sir Isaac Newton endeavours to fettle, and from thence to recally the ancient chronology. This he shows, by several authorities, to have been one generation or about thirty years earlier than the taking of Troy, and 43 years later than the death of Solomon. See Chronology.

Dr Bryant, however, rejects the history of the Argonautic expedition as a Grecian fable, founded indeed on a tradition derived from Egypt, and ultimately referring to Noah's prefervation, &c. in the ark. But although we are not to believe all the romantic stories which poets, and even some grave historians, have told us of those famous adventurers, yet it feems unreasonable to discredit entirely the Argonautic expedition. See Argonauts.

M m ARGONAUTICA,

Aremberg rite face of the Romans, and greatly ornamented; and hence called Gallula Roma, (Aufonius). It is now Areopagus. called Arles. E. Long. 5. 5. N. Lat. 43. 40.

AREMBERG, a small town of Germany, in the crele of Westphalia, defended by a castle. It is the capital of a county of the same name, and was erected into a principality by the emperor Maximilian II. in favour of John de Ligne, lord of Barbazon, who took the name of Aremberg. It is feated on the river Aer, E. Long. 7. 3. N. Lat. 50. 27.

AREMORICA, or Armorica, a part of Gaul between the Sequana and Ligeris, (Casar, Hirtius); denoting a country on, or beyond the fea, ar mour, or are moer, Celtic. Pliny indeed fays, that Aquitania was formerly called Aremorica; but in this he stands alone. In the lower age, the term Armorica was confined to Bretagne in France.

ARENA, in Roman antiquity, a place where the gladiators fought; fo called from its being always strewed with fand, to conceal from the view of the people the blood spilt in the combat. Nero is faid to have threwed the arena with gold dust.

ARENARIA, or Sandwort, in botany; A genus of the decandria trigynia class; and in the natural method ranking under the 22d order, Caryophylla. The calyx has five open leaves; the petals are five, and entire; the capfule is unilocular, and contains many feeds. There are 17 species of arenaria, only seven of which are natives of Britain, viz. the peploides, or fea fandwort; the trinervis, or plaintain-leaved fandwort; the serpyllifolia, or least fundwort; the faxatilis, or mountain fandwort; the laricifolia, or larch-leaved fandwort; the tenuifolia, or fine-leaved fandwort; and the rubra, or purple-flowered fandwort.

ARENACUM, or ARENACUS, one of the four towns or larger villages in the island of the Batavi, (Tacitus). Now Arnheim, in Guelderland. E. Long.

5. 20. N. Lat. 52. 2.

ARENARII, in antiquity, gladiators who combated with beafts in the arena or amphitheatre. arenarii were slaves of the lowest rank; so that, though manumitted, they were not capable of being Roman citizens. They were the same with what were otherwife called Befliarii.

ARENARIUM, in ecclefiastical writers, denotes a cemetery or burying ground. The arenaria were properly a kind of pits, or holes, under ground, wherein the ancient Christians not only buried their dead, but held their religious affemblies in times of perfecution.

ARENSBERG, a small town of Germany, in the circle of Westphalia, upon the river Roer. E. Long. 8. 20. N. Lat. 51. 25.

ARENSBOURG, an episcopal and maritime town of Livonia in Sweden, feated in the ifle of Ofel, in the Baltic sea. E. Long. 22. 40. N. Lat. 58. 15.

AREOLA, among anatomists, the coloured circle

furrounding the nipple of the breaft.

AREOPAGUS, a fovereign tribunal at Athens, famous for the justice and impartiality of its decrees, to which the gods themselves are said to have submitted their differences. It was in the town, on a rock or hill opposite to the citadel. The word fignifies Strictly, rock of Mars.

Plutarch attributes the establishment of the Arco-Vol. II. Part I.

pagus to Solon. Other authors think differently: and Arcopagua with good reason; for it appears undeniable, that this' tribunal was instituted before Solon. But the best authorities allow him the honour of its restoration. The city of Athens, governed till this time by tribunals of a circumferibed jurifdiction, which were multiplied by the most trisling accidents and circumstances, took no fixed political or civil form, however closely united the members of those tribunals were by their general views towards the public good, and by the common love of their country. As each of those tribunals could only act in proportion to the power delegated to it. it was impossible that so many different and unequal impressions should give to the great machine of the flate that uniform and regular movement which, by an impulse always the same, would keep each part in the fituation it should maintain with relation to the whole.

To effect this universal and harmonious power, it was necessary to unite the different channels of public anthority, which, by being too much distributed, lost its force. This authority Solon collected, and placed it all in the court of Areopagus, which confequently became the main spring of the government. The judges of this court, who, under Draco, decided only in cases of murder, now took cognizance of crimes of every kind: and the fame tribunal which inflicted capital punishment on murder, poilouing, burning of houfes, theft, &c. flruck at the roots of those crimes, by arraigning idlenefs, luxury, and debauchery. Equally attentive to stimulate the indolence of the young, and the languor of the old, these fage judges reused in the one the laudable ambition to serve the state, and reflored to the others their former activity. Satisfied that extremes produce the same effects, they thought the republic had as much to fear from the excess of wealth as from the gripe of poverty. Hence they exacted a minute account of the effects of every individual. Hence their great feverity to those idle citizens. who, instead of being useful members in a state, are its bane and its dishonour. Isocrates draws a most beautiful and striking picture of those venerable and aftonishing men, and of the order and harmony which flourished in Athens by their wife administration.

The judges of the Arcopague, fays that author, were more industrious to prevent crimes, by representing them in an odious light, than to establish modes of punishment. It was their opinion, that the enemies of the state were the instruments destined by the gods to punish the wicked; but that it was their province to correct and reform public and private manners. They were vigilantly attentive to the conduct of all the citizens, but particularly to that of the youth. They well knew that the impetuofity of juvenile passion gave the most violent shocks to health and growing virtue; that it was the duty of inspectors of education to soften the austerity of moral discipline with innocent pleafure; and that no recreations were more eligible than bodily exercises, which enable a young man to give a good education its full play, which improve health, give a pleafurable and agreeable vivacity, and even fortify the mind. The fortunes of the Athenians were too unequal to admit the same mode of education; and therefore the youth were trained in a manner fuitable to the rank and circumflances of their respective fami-

Arcopagus lies. Those of the inserior classes were taught agriculture and commerce; from this principle, that idleness is followed by indigence, and that indigence excites to the most daring and atrocious crimes. Having thus endeavoured, by wife precautions, to preclude the entrance of moral evil, they thought they had little to

Exercises of the body, such as horsemanship and hunting, were objects of education to the youth of liberal fortune. In this fage distribution, their great ain was to prevent the poor from committing crimes, and to facilitate to the rich the acquisition of virtue. Not fatisfied with having established good laws, they were extremely careful to fee that they were observed. With this view they had divided the city into quarters, and the country into cantons. Thus every thing paffed under their eyes; nothing escaped them; they were acquainted with the private conduct of every citizen. Those who had been guilty of any irregularity were cited before the magnifrates, and were reprehended, or punished in proportion to their mildemeanour.

The fame Areopagites obliged the rich to relieve the poor. They repressed the intemperance of the youth by a fevere discipline. Corruption in magiilrates was suppressed by the punishments denounced against it; and the old men, at the fight of the employments of the young, felt themselves animated with a degree of juvenile vigour and activity.

Religion came likewife under the cognizance of the Areopagites. Plato durit never, as we are told by Juthin Martyr, divulge his private opinion concerning the Deity. He had learned from the Egyptians the doctrine of Mofes. It appeared to him the bell, and he embraced it with aid our. But his dread of the Areopagit., who were attached to the prevailing fyslem, would not permit him even to name the author of fentiments which opposed the common tradition.

The public edifices, the cleanness of the streets, the pay of the foldiers, the diffribution of the public money; in a word, whatever intereffed the republic, was under the direction of the Arcopagus. The people themselves, icalous as they were of their power, did nothing without confulting this affembly, and fuffered it without a minmur, to amend their precipitate decrees. Yet this authority, however great it may feem, was subject to the laws; by them rewards and punishments were determined; and those respectable judges gave an account of the exercise of their trust to public confors, who were placed betwixt them and the people, to prevent the arillocracy from growing too powerful.

The most important qualifications were required in those who entered into the Areopagus. Solon made a law, by which they who had not been archons for a year should not be admitted members of the Areopagus. To give more force to his law, he subjected himfelf to it, and was only admitted on that title. This was but the first step; those annual magistrates, after having given law to the republic, were interrogated on their administration. If their conduct was found irreproachable, they were admitted Areopagites with eulogium; but the smallest misconduct excluded them from that honour for ever. What administration was not to be expected from a tribunal fo well composed! what veneration was not due to men of fuch raic ta. Areopague lents and virtue! Such respect was paid them, that people prefumed not to laugh in their prefence; and fo well established was their reputation for equity, that those whom they condemned, or dismissed without granting their petition, never complained that they has been unjuffly treated.

The edifice of the Areopagus was extremely simple; and its roof, which was at first of the most common materials, remained in that flate till the time of Augustus. This we learn from Vitruvius. Orestes was the first who thought of embellshing it. He raised in it an altar to Minerva. He likewife adorned it with two feats of folid filter; on one of which the accuser fat, and the accused on the other. The one feat was confecrated to Injury, and the other to Impudence. This religious sketch was brought to perfection by Epimenides, who erected altars to those allegorical deities, and foon after a temple, which Cicero mentions in his fecond book of laws. This temple corresponded with that which Orefles had built to the Furies, who brought him to Athens, and produced him the protection of Minerva. Epimenides dedicated it a fecond time to the Furies, or fevere Goddeff.s, as they were termed by the Athenians. A man was thought loft without resource, and a victim to every human all, if he enforced a perjury by invoking the facred name of those tremendous divinities.

Those who employed their thoughts in solving the mysteries of Paganism, imagined that the Eumenides had their temple fo-near the court of Areopagus, that they might ealighten the judges by their inspiration, and, by their continual affiliance, prevent them from committing those errors to which human weakness is liable. To propitiate those terrible deities, and to procure their favour for the Arcopagus, they were worshipped with great punctuality and devotion; and the* fenare itself appointed their priests. Demosthenes had been nominated to preside over their facrisices; and hethought it very extraordinary, that he, to whom the republic had confided to important an office, thould be

publicly impeached.

It was natural to affociate with the Eumenides the other deities who shared with them the fovereign empire over the dead. Epimenides placed in their temples the flatnes of Pluto, of Mercury, and of Tellus. They were all, according to Paulauias, of an agreeable form. Each of them was placed upon an altar, on which the citizens, or ftrangers, who had been acquitted by the Areopagus made their grateful offerings. But it was not to gratitude alone that these several deities owed all the incense that smoked upon their altars. They who had been accused before the fenate, haraffed with superstition, and uncertain how these deities would be affected towards them, were lavish of facrifices to obtain their elemency, by which they hoped their judges would likewise be influenced.

The tomb of Oedipus was another of the ornaments of the Arcopagus. It was in the outward court of the Arcopagus, where a barge was likewife placed, which made a part of the pomp at the public games.

Whatever homage and implicit obedience the court of Areopagus might derive from all this religious parade, the public good was always dearer to them Arcopagus. than any lower advantages they might have drawn from the alters and temples with which they were furroyided.

The fenate affembled in a hall built on the fummit o'a hill, which was afcended with difficulty by the old men bent with age. However, as for fome time they only affembled on the three last days of each month, they bore with patience this inconvenient situation. But public affairs multipled to such a degree, that they were obliged to add to the three former sittings a fourth, which was held on the feventh day of the month, and which was soon succeeded by an affembly every day. Their meetings were so regular, that they were not interrupted by the most solemn festivals, till Cephisodorus was archon, who, in the third year of the 105th Olympiad, made a decree, which obliged the Areopagites to celebrate, after the example of the other courts, the Apaturian feasts, which lasted five days.

This affiduous and painful exercise of their office made the Arcopagites feel all the inconvenience of the fituation of their tribunal, and determined them to remove it to a part of the city called the Royal Portico. It was a square, exposed to all the inclemencies of the weather. When the judges, who assembled there in profound silence, had taken their places, they were enclosed by a thread, or rather a cord, drawn around them.

They held their assemblies in the night, that their attention to public assairs might not be diverted by external objects,—and (adds Lucian) that they might only be influenced by the arguments, and not by the presence and action, of the speakers. This circumstance explains a passage in Athenxus, who tells us, that none knew the numbers nor faces of the Arcopagites. The custom of administering justice in the open air was not peculiar to them. It was followed by all the other tribunals when they tried for murder: for two reasons:—1st, That the judges, the sworn protectors of innocence, might not be hart by being under cover with criminals, whose hands were polluted with blood. 2dly, That the accuser and the accused might not be under the same roof.

When all the men bers of the fenate were convened, a herald entoined filence, and ordered the people to retire. As from as they had departed, the affembly proceeded to butinefs; and as they deemed the least preference a flagrant injustice, the causes which they were to determine were drawn by a kind of lottery; and the same chance which brought them up, distributed them to different numbers of judges, small or great, according to the importance of the several causes.

In early times, the parties themselves stated their cause in a simple manner. The eloquence of advocates was thought a dangerous talent, sit only to varnish crimes. But afterwards the Arcopagus, on this point, relaxed from their severity; at sirst the accused, and soon after the accusers, were permitted to engage those to make the attack and the defence, whose profession it was to exert the art of speaking for others, with accuracy and elegance.

Sextus Empiricus seems not to have sufficiently distinguished times, where he says, that the court of Areopagus did not suffer those who are to be tried at their bar to avail themselves of the abilities of others.

What undoubtedly led him into that mistake, was Accept an inviolable cuftom of that tribural, which prohibited, in pleadings, all that warm and picturefque oratory which feduces the judgment and inflames the puffions. When the fullrages were collected, each person gave his in filence. They voted with a small flint, which they held betwixt the thumb and the two next fingers, and which they put into one of the two urns that flood in a corner of the hall. One flood before the other. The first was called the urn of death; the fecond, the urn of compossion. That of death was of brass, and was termed proper; that of compassion was of wood, and was termed improper. The judges commonly brought their flint to the affembly, and put it into the urn; but, that all the fuffrages might be collected, the herald took the two urns, and prefented them, one after another, to every fenator, commanding him, in the name of the republic, no longer to defer his acquittal or condemnation.

E

For this method of giving fentence, which was called *g=2000 days, because it kept the vote of each person matrices red, the Thirty Tyrants, to make themselves matter, of the decisions of the Accopagus, substituted another, by means of which they knew exactly the opinion of each of the judges, for they chaged then to bring their flints publicly, and lay them upon two tables placed before them, the situation of which was quite opposite that of the urns; for the sirfl of those tables was that of life, and the second that of death.

The first fubstances with which they gave their fuffrages were not fmall pieces of the bones of a hog, as fome authors affert, but fea shells, for which pieces of brass, of the same form, termed spondyla, were afterwards fubflituted. The fubflances with which they voted were diffinguished by their form and colour. Those which condemned were black, and perforated in the middle; the others were white, and not perforated. The precaution of piercing the black ones tends to prove, what we have already observed, that the court of Areopagus fat in the night: for what end did it serve to pierce the black shells, or flints, if the judges could have feen them and the white ones, and confequently have diffinguished their colours by the affifiance of the light? But as they puffed fentence in the dark, it is evident that a difference befides that of colour was necessary, to know the black ones from the white. The judges were likewife permitted to multiply at pleafure the diffinctions between figns, which effentially diftinguished the fates of men.

After the suffrages were collected, they were taken out of the two urns, and put into a third vase of brass. They were then counted; and as the ramb i of white or of black slints was higher or inferior, one of the judges drew with his nail a shorter or a longer line on a tablet with a waxen surface, on which the result of each cause was marked. The short line expected acquittal; the long, condemnation.

With regard to the emoluments of the judges, the swere as moderate as those of the advocates. The length of the process did not enhance its expence; and when the decision of a carrie was postponed till the next day, the committee were only paid an obolus on that day. Hence Mercury, in Lucian, is surprised that such fensible old men as the senators of Arcopagus were

breepagus should sell at so low a price the trouble of ascending

ofo high.

As to the number of the judges which composed the Areopagus, some authors, attentive only to a part of Solon's regulations, by which he enacted, that for the future, none but the nine archons should be admitted members of the Areopagus, have imagined, that this tribunal was filled anew every year, and that it never confilted of more than nine magistrates. This opinion, and some others, are refuted by the circumflantial account which Diogenes Laertius gives us of the condemnation of Socrates. This great man had wished to substitute a rational hypothesis for the fabulous and extravagant system of religion which prevailed in his time. His project, however laudable, appeared impious in the eye of superstition. Information was laid against him before the Areopagus, and he had as many accusers as fellow citizens. After the charges and the answers were heard, they proceeded to fuffrages. The opinions were divided, but not equally, for the number of those who condemned him execceded by 281 the number of those who declared him innocent. He made an ironical reply to this iniquitous fentence, by telling his judges, that he took it for granted, they would admit him to a maintenance in the Prytaneum. On this farcasm, 80 of those who had voted in his favour forfook him, went over to the opposite party, and condemned him to die. Here then we have 361 judges who condemn; to whom if we add those who persist in acquitting him, the number must be very considerable.

Of all the judgments of the Arcopagus, the most famous one, excepting that of Mars, was the fentence which they passed on Orestes. His trial, which happened under Demophoon the 12th king of Athens, in 375 of the Attic era, owed all its fame to a remarkable circumstance, that gave rise to a custom which was observed ever afterwards. Orestes had killed his mother. He was accused before the Arcopagus, and cited to appear in that court. He would have loft his life in consequence of the equal division of the votes, had not Minerva, moved with his misfortunes, declared herfelf for those who had absolved him, and joined her fuffrage to theirs. Thus Orestes was faved. In veneration to this miracle, the Areopagites, whenever the fuffrages were equally divided, decided in favour of the accused, by granting him what they termed the shell of Minerva. Cephalus and Dædalus were condemned by the Areopagus long before the time of

Orestes.

We find in ancient authors fome decisions of this tribunal, which bear the strongest marks of justice, though their objects are not interesting. here quote an anecdote from Aulus Gellius, and Valerius Maximus, of a woman, who was accused of having poisoned her husband and her son. She was taken and brought before Dolabella, who was then proconful of Afia. She was no fooner in his presence than the owned the fact; and added, that the had very good reasons for putting her husband and her son to death .- " I had (faid she) to my sirst husband a fon whom I tenderly loved, and whose virtues rendered him worthy of my affection. My fecond husband, and the fon whom I bare to him, murdered my favourite child. I thought it would have been unjust to

have fuffered those two monsters of barbarity h live. Arcopagus, If you think, Sir, that I have committed a crine, it Arcquiba. is your province to punish it: I certainly shall sever repent of it." This affair embarrassed Dolabella. She was afterwards fent to the Areopagus; and that cout, when they had examined her a long time, ordered her and her accuser to appear before them again a hundred years after, from the first day of her trial.

We must not, however, suppose that the Arcopagus always preferved its old reputation; for such is the constitution of human affairs, that perfection, with regard to them, is a violent, and confequently a transitory, state. Pericles, who lived about 100 years after Solon, to flatter the people and win them to his party, used his utmost efforts to weaken the authority of the Areopagus, which was then disliked by the multitude. He took from it the cognizance of many affairs which had before come under its jurisdiction; and to forward his defign of humbling it, employed the eloquence of Ephialtes, whose talents were formidable, and who was an avowed enemy to the great men of Athens.

The Areopagus itself seemed to second the endeayours of a man who projected its ruin, and by its mifconduct hastened its fall. The old rules of the court, by which none were admitted its members but those whose unexceptionable conduct would support its majesty, seemed too severs. They grew less delicate in their choice; and prefuming that the faults with which they dispensed, would soon be reformed in the society of fo many good examples, vice imperceptibly crept among them: corruption, at first secret and timid, grew infenfibly open and daring, and made such progress, that the most shameful crimes were soon exhibited on the stage; and they were not copied from the low and abandoned multitude, but from those senators, once the venerable and auftere cenfors of idleness and of vice. Demetrius, the comic poet, wrote a piece which he entitled The Areopagite, where he ftrips the mask off those hypocritical legislators, who were now equally apt to be feduced by wealth and by beauty. So much had the Athenian senate degenerated in the days of Isocrates, cir. 340 years before the Christian era.

Before this tribunal St Paul was called to give an account of his doctrine, and converted Dionysius one of their number.

The end of this court of judicature is as obscure as its origin, which was derived from very remote antiquity. It existed, with the other magistracies, in the time of Paulanias, i. e. in the 2d century. The term of its subsequent duration is not ascertained; but a writer, who lived under the emperors Theodosius the Elder and Younger, in the 5th century, mentions it

AREQUIBA, a city of Peru in South America, fituated in W. Long. 73°. S. Lat. 17°. It is one of the most beautiful cities in all Peru, being delightfully fituated in the valley of Quilca, 100 leagues from Lima, and 20 from the lea, with which it communicates by a fine river. The entrance into the harbour is rather shallow for ships of great burden; but when once they are entered, they may ride fecurely in 18 fathoms water. This city was founded in 1539, by order of Don Francisco Pizarro, in a place known likewise by the name of Arequiba; but its fituation being found disadvantageous, the inhabitants obtained leave to remove the place where the city now flands. The hous are built with stone, and vaulted; and, contranto what is usual in warm countries, they are lofty, nealy furnished within, and finely decorated on the outlide. The inhabitants also are exempt from many deafes common in other parts of Perit; which per-Paps is owing to their keeping the streets clean by means of canals which extend to the river. The temperature of the air is extremely good; and though fometimes a flight frost is perceivable, the cold is never excessive, nor the heat troublesome, so that the furrounding fields are clothed with perpetual verdure. These natural advantages, however, are considerably allayed by its being very subject to earthquakes, by which it has already been five times laid in ruins; notwithstanding which, it is populous, and has among its inhabitants fome of the noblest families in America.

ARES, a word of Paracelfus's, by which he would express that power of nature in the whole material world, by which species are divided into individuals.

ARETÆUS of Cappadocia, a Greek physician of the sect of the Pneumatists, lived in the reign of Augustus, according to some; according to others, under Trajan or Adrian. He wrote several treatises in the Ionian dialect, on acute diseases, and other medicinal subjects; some of which are still extant. The best edition of his works is that of Boerhaave, in Greek and Latin, with notes, printed in 1731: that of Wigan, printed at Oxford in 1723, in solio, is also much esteemed.

ARETHUSA, in fabulous history, the daughter of Nereus and Doris, and the companion of Diana, who changed her into a fountain to deliver her from

the pursuit of her lover Alpheus.

ARETHUSA, a celebrated fountain near the city of Syracuse in Sicily, famous for the quantity of its waters, and the number of fishes it contained. Many fables were invented by the ancients concerning this fountain. They had also a notion that the river AL-PHEUS ran under or through the waters of the fea, without mixing with them, from Peloponnesus to Sicily. Mr Brydone informs us, that it still continues to fend forth an immense quantity of water, riling at once to the fize of a river, but is entirely abandoned by the fishes it formerly contained in such plenty. At some distance from Arethusa is a fountain of fresh water which boils up very strongly in the sea, insomuch that, after piercing the falt water, it may be sometimes taken up very little affected by it. This fountain Mr Brydone thinks the ancients were ignorant of, or they would not have failed to use it as an argument for the submarine journey of Alpheus.

Mr Swimburne describes this once famous fountain as a large pool of water near the quay, defended from the sea by a wall, and almost hidden by houses on every other side. The water is not salt, but brackish, and sit for no purpose but washing linen. "This (says he) is the celebrated fountain of Arcthusa, whose soft poetical name is known to every reader. The sable of the symph and her constant lover Alpheus, the excellence of the spring, and the charms of its situation, are themes on which ancient and modern poets have indulged their sancy, and exercised their pens. Alas, how altered subbish chokes up its wholesome sources; the waves have found a passage through the rocks, which repeat-

ed earthquakes have split; and not a fish is to be seen in it. Sometimes, after an earthquake, it has been left dry; and, at other times, the whole mass of its waters have been tainted by subterraneous effluvia. Its sountain head probably lies among the neighbouring hills."

ARETHUSA, in botany: A genus of the gynandria diandria class; and in the natural method ranking under the 7th order, Orchidea. The generic character is taken from the nectarium, which is tubular, situated at the bottom of the corolla, and the inferior labium fixed to the stylus. There are four species; all natives of America, except the capensis, which is only found at

ARETIA, in botany: A genus of the pentandria monogynia class; and in the natural method ranking under the 21st order, *Pretia*. The corolla is divided into five parts; the tube of the corolla is ovated; and the capfule is globular, and confists of but one cell.

There is only one species, viz. the alpina.

the Cape of Good Hope.

ARETIN (Guido), famous for his musical improvements, lived in the 13th century. He was a native of Arezzo, a city in Tuscany; and having been taught the practice of music in his youth, and probably retained as a chorister in the service of the Benedictine monastery sounded in that city, he became a monk professed, and a brother of the order of St Benedict.

In this retirement he seems to have devoted himself to the study of music, particularly the system of the ancients, and, above all, to reform their method of notation. The difficulties that attended the instruction of youth in the church offices were fo great, that, as he himself says, ten years were generally consumed barely in acquiring the knowledge of the plain fong; and this confideration induced him to labour after fome amendment, some method that might facilitate instruction, and enable those employed in the choral office to perform the duties of it in a correct and decent manner. If we may credit those legendary accounts that are extant in old monkish manuscripts, we should believe he was affifted in his pious intention by immediate communications from heaven: fome speak of the invention of the fyllables as the effect of inspiration; and Guido himself seems to have been of the same opinion, by his faying it was revealed to him by the Lord; or, as fome interpret his words, in a dream : but graver historians fay, that being at vespers in the chapel of his monastery, it happened that one of the offices appointed for that day was the hymn * to St John.

UT queant laxis MIra gestorum SOLve pollutis REsonare sibris FAmuli tuorum LAbüs reatum, SanAe Joannes. fed by Pau a deacon o the church of Aquileu about the year 770,

* Commo-

During the performance of the hymn, he remarked the iteration of the words, and the frequent returns of UT, RE, MI, FA, SOL, LA: he observed likewise a diffimilarity between the closeness of the syllable MI and the broad open sound of FA, which he thought could not fail to impress upon the mind a latting idea of their congruity; and immediately conceived a thought of applying these fix syllables to perfect an improvement either then actually made by him, or under consideration, viz. that of converting the ancient tetrachords into hexachords.

treim.

Struck with the discovery, he retired to his study, and having perfected his fystem, began to introduce it into practice; the persons to whom he communicated it were the brethren of his own monastery, from whom it met with but a cold reception, which in the epifile to his friend, he aferibes undoubtedly to its true cause, envy; however his interest with the abbot, and his employment in the chapel, gave him an opportunity of trying the efficacy of i is method on the boys who were training up for the choral fervice, and it exceeded the most fanguine expectation. " To the admiration of all (fays Cardinal Baronius) a boy thereby learnt, in a few months, what no man, though of great ingenuity, could before that attain in feveral years."

The fame of Guido's invention foon spread abroad, and his method of neltruction was adopted by the clergy of other countries. We are told by Kircher, that Hermannus, bithop of Hamburgh, and Elviricus bithop of Ofnaburg, made use of it, and by the authors of the Historie Litteraire de la France, that it was received in that country, and taught in all the monafteries in the kingdom. It is certain that the reputation of his great skill in music had excited in the pope a defire to fee and converse with him; of which, and of his going to Reme for that purpose, and the reception he met with from the pontiff, he himself has given a circumflantial account in the epittle hereafter mentioned.

The particulars of this relation are very curious; and as we have his own authority, there is no room to doubt the truth of it. It feems that John XX. or as fome writers compute the 19th pope of that name, having heard of the fame of Guido's school, and conceiving a defire to fee him, fent three messengers to invite him to Rome; upon their arrival, it was resolved by the brethren of the monaftery, that he should go thither attended by Grimaldo the abbot, and Peter the chief of the canons of the church of Arezzo. Arriving at Rome, he was prefented to the holy father, and by him received with great kindness. The pope had feveral conversations with him, in all which he interrogated him as to his knowledge in music; and upon fight of an antiphonary which Guido had brought with him, marked with the fyllables agreeable to his new invention, the pope looked on it as a kind of prodigy; and ruminating on the doctrines delivered by Guido, would not fur from his feat till he had learned perfectly to fing off a verse: upon which he declared, that he could not have believed the efficacy of the method, if he had not been convinced by the experiment he had himself made of it. The pope would have detained him at Rome but labouring under a bodily diforder, and fearing an injury to his health from the air of the place, and the heats of the fummer, which was then approaching, Guido lest that city upon a promise to revisit it, and explain to his holiness the principles of his new system. On his return homewards, he made a visit to the abbot of Pomposa, a town in the duchy of Ferrara, who was very earnest to have Guido fettle in the monastery of that place; to which invitation it feems he yielded, being, as he fays, defirous of rendering so great a monastery still more famous by his itudies there.

Here it was that he composed a tract on music, enrtitled Micrologus, i. e. " a short discourse;" which he dedicated to Theodald bishop of Arezzo; and misted, Aretinas he himself at the end of it tells us, under the jontificate of John XX, and in the 34th year of his age: Voffins speaks also of another musical treatise writte by him, and dedicated to the same person.

Most of the authors who have taken occasion to mention Guido, speak of the Micrologus as containing the fum of his doctrine: but it is in a finall tract, en, titled Argumentum novi Cantus inveniendi, that his declaration of his use of the syllables, with their several mutations, and in fhort his whole doctrine of folmifation, is to be found. This tract makes part of an epiftle to a very dear and intimate friend of Guido, whom he addresses thus, " Beatissimo atque dulcissimo fratri Michaeli ;" at whose request the tract itself seems to have been composed.

Whether Guido was the author of any other tracts, is not easy to determine. It nowhere appears that any of his works were ever printed, except that Baronius, in his Annales Ecclefiaffici, Tom. XI. p. 73. has given at length the epiftle from him to his friend Michael of Pompofa, and that to Theodald bishop of Arezzo, prefixed to the Micrologus: and yet the writers on mulic fpeak of the Micrologus as of a book in the hands of every one. Martini cites feveral manuscripts of Guido; namely, two in the Ambrofian library at Milan, the one written about the twelfth century, the other lefs ancient; another among the archives of the chapter of Pistoja, a city in Tuscany; and a third in the Mediceo-Laurenziano library at Florence, of the 15th century: these are clearly the Micrologus. Of the epittle to Michael of Pompola, together with the Argumentum novi Cantus inveniendi, he mentions only one, which he fays is somewhere at Ratisbon. Of the several tracts above mentioned, the last excepted, a manuscript is extant in the library of Baliol-college in Oxford. Several fragments of the two first, in one volume, are also among the Harleian manuscripts now in the British Mufeum, No 3199; but so very much mutilated, that they afford but small satisfaction to a curious inquirer.

ARETIN (Leonard), one of the most learned men of the 15th century, was fecretary to the republic of Florence, and translated from the Greek into Latin fome of the Lives of Plutarch, and Aristotle's Ethics: he also composed three books of the Punic war, that may ferve as a supplement to those wanting in Livy the hillory of the transactions in Italy during his time; that of ancient Greece; that of the Goths; that of the republic of Florence; and many other books. He died in 1443, aged 74.

ARETIN (Francis), a man of great reading, and well acquainted with the Greek language. He translated into Latin the Commentaries of St Chrysostom upon St John, and about 20 Homilies of the same father: he also translated the Letters of Phalaris into Latin, and wrote a treatise De balneis Puteolanis. He studied at Sienna, about the year 1443; and afterwards taught law there with fuch reputation, that they called him the Prince of Subtleties, and his wit became a proverb. He displayed his talents chiefly in disputes, in which nobody could withstand him. He gave his opinions in law with fo much confidence, as to affure those who consulted him that they should carry their cause: nor did experience contradict him; for it was a common faying at the bar, fuch a cause has been con-

Aresin, demned by Arctin, it must therefore be lost. He taughfalfo in the university of Pifa, and in that of Ferrara./He was at Rome under the pontificate of Sixtus N. but did not flay here long; for he foon perceived that the great hopes which he had built upon his reputation would come to nothing. This pope, lywever, declared he would have given him a cardinal's but, had he not thought he should have done a public mjury by depriving the youth of fuch an excellent professor. When old age would not permit him to go through the duties of his office, they dispensed with his reading of lectures, and his falary was continued. He continued, however, fometimes to mount the chair; and although his lectures had now but little spirit in them, yet he had ftill many hearers on account of his reputation. One day when the students were gone to fome public shows, there were but 40 persons in his auditory; which fo mortified him, that he threw away his book; and crying out, " Arctin shall never explain law to a few perfons," retired in a passion, and would teach no more. He was fevere in his temper, and never kept a fervant longer than a month or two; for it was a maxim of his, " that new hired fervants always ferve best." He was honoured with the title of knight, and spent all his life in celibacy; and his way of living was fo parfimonious, that he was thereby enabled to amass a great deal of wealth. He had defigned this wealth for the maintenance of a college; but he altered his resolution, and left it to his relations.

ARETIN (Peter), a native of Arezzo, who lived in the 16th century. He was famous for his fatirical writings; and was fo bold as to carry his invectives even against sovereigns, and from thence got the title of the Scourge of Princes. Francis I. the emperor Charles V. most of the princes of Italy, several cardinals, and many noblemen, courted his friendship by prefents, either because they liked his compositions, or perhaps from an apprehension of falling under the lash of his fatire. Arctin became thereupon fo infolent, that he is faid to have got a medal struck, on one side of which he is represented with these words, IL DIVINO ARETINO; and on the reverle, fitting upon a throne, receiving the prefents of princes, with thefe words, I PRINCIPI TRIBUTATI DA POPOLI, TRIBUTANO IL SERVIDO LORO. Some imagine that he gave himfelf the title of Divine, fignifying thereby that he performed the functions of a god upon earth, by the thunderbolts with which he struck the heads of the highest perforages. He used to boast, that his lampoons did more service to the world than sermons; and it was faid of him, that he had subjected more princes by his pen than the greatest had ever done by their arms: Aretin wrote many irreligious and obscene pieces; such are his dialogues, which were called Ragionamenti. There is likewife imputed to him another very obfeene performance, De omnibus Veneris schematibus. " It Origin de was about the year 1525 (fays Mr Chevillier *) that imprimerie Julio Romano, the most famous painter of Italy, instigated by the enemy of the falvation of mankind, invented drawings to engrave 20 plates: the subjects are fo immodest that I dare only name them. Peter Aretin composed sonnets for each figure. George Vasari, who relates this in his Lives of the Painters, fays, he does not know which would be the greatest inspurity, to cast one's eyes upon the drawings of Julio, or to dip into Areteldi the verses of Arctin." Some say that Arctin changed his libertine principles; but however this may be, it Argeist is certain that he composed several pieces of devotion. He wrote a paraphrase on the penitential psalms, and another on Genesis; he wrote also the Life of the Virgin Mary, and that of St Catharine of Sienna, and of St Thomas Aquinas. He was author likewife of some comedies. He died in the year 1556, being about 65 years old.

ARETOLOGI, in antiquity, a fort of philosophers, chiefly of the Cynic or Stoic tribe, who having no school or disciples of their own, haunted the tables of great men, and entertained them in their banquets with disputations on virtue, vice, and other popular topics. These are sometimes also denominated Circulatores Philosophi. In this sense, the word is derived from the Greek agers, virtue, and Loyos, difcourfe. Some authors choose to derive the word from ageros, gratus, "agreeable;" and define Aretologi, by perfons who firive to divert and entertain their audience with jokes and pleasant tales; which latter seems the more natural explication.

AREZZO, a city of Italy, in Tuscany, seated in the territory of Florence, on the declivity of a bill that overlooks the neighbouring plain, between the Citta di Castelli and Florence. It is an ancient city, and a bishop's see; and was famous for a kind of earthen ware much efteemed by the Romans. It was greatly fallen to decay when Cosmo de Medicis took it under his protection; fince which it has been recovering gradually. It is famed for being the birth place of Mec.e-nas. E. J.ong. 12. 2. N. Lat. 43. 27.

ARGEA, or Arger, in Roman antiquity, thirty human figures, made of ruthes, thrown annually by the priests or vestals into the Tiber, on the day of the idea of May .- Plutarch, in his Roman Questions, inquires why they were called Argea. There are two reasons affigued. The first, that the barbarous nations who first inhabited these parts cast all the Greeks they could meet with into the Tiber: for Argians was a common name for all Grecians: but that Hercules perfuaded them to quit fo inhuman a practice, and to purge themselves of the crime by instituting this solumnity. The fecond, that Evander, an Arcadian, and a fworn enemy of the Argians, to perpetuate that enmity to his policrity, ordered the figures of Argians to be thus cast into the river.

ARGEIA, or Argolis, a diffrict of Peloponnefus, fituated between Arcadia to the west, the Egean sca to the exit, Laconia and the Sinus Argolicus to the fouth, and to the north the territory of Corinth and the Sinus Saronicus (Livy, Ptolemy); fo called from Ar-Gos, the capital: Now Romania di Morea.

By the Greeks the people were called Argeii, from Argi or Argos; by the Romans, Argivi, Argives. They were a colony who migrated, it is faid, from Egypt, under the command of Inachus. Polemon and Prolemy Mendesius, ancient Greek writers, inform us, that Inachus was contemporary with Amofis, who demolifhed Avaris, and expelled the thepherds out of Egypt. If, with some learned chronologers, we suppose Inachus to have begun to reform the Argives B. C. 1856, and to have died B. C. 1808, he must have been coeval with Amolis, who reigned in Upper Egypt 15 years before

ie Paris. 1. 224.

the expulsion of the shepherds, and 10 years after that event, which happened B.C. 1806. Inachus was styled Argentan. the Son of the Ocean, because his origin was not known, or because he had come by sea into Greece. Before his arrival the inhabitants were rude and barbarous. These he united and civilized, and instructed in various arts. His fon Phoroneus instituted the laws of government; and, on that account, has been called the first king in Argos, the first of men, and the father of mortals. family of Inachus, after having kept possession of the throne 347 years, were expelled by Danaus, who arrived B. C. 1509 with a colony from Canasan. Actifius, the last king of Argos, died B. C. 1313; and was succeeded by Perseus, his grandson, who transferred the seat of government to Mycenæ, 544 years from the first year of Inachus, in the reign of Cecrops II. king of Athens, and about the time when Pelops the fon of Tantalus king of Phrygia, having been compelled by Ilus to leave his native country, came into Greece with great wealth, and acquired supreme power in the region afterwards called by his name. In the 37th year of Eurystheus, grandson of Perseus, the Argonautic expedition happened, i. e. B. C. 1224. unjust and tyrannical prince had assigned to Hercules his talks; and, after the death of that hero, he banished all his children. These were the Heraclidæ who fled to Athens for protection, and who returned to Peloponnesus 40 years after the destruction of Troy. In the reign of Agamemnon, the Trojan war commenced, and it was carried on with vigour during the space of ten years. In the year B. C. 1184, Troy was taken, and the war was concluded. Scarcely had the Grecians settled in their own country after their return from this dangerous expedition, when the posterity of Hercules invaded Peloponnesus, took possession of it, and divided it among themselves. Here the kingdom of Mycenæ ended, and that of Sparta was established on its ruins. See SPARTA.

ARGEMONE, PRICKLY POPPY: A genus of the monogynia order, belonging to the polyandria class of plants; and in the natural method ranking under the 27th order, Rheader. The corolla confifts of fix petals; the calyx is triphyllous; and the capfule is femivalved. Of this genus there are three species, which are common in many parts of the West Indies, and called by the Spaniards the devil's fig; but they are of no uie, and have very little beauty.

ARGENCES, a town of France, in Lower Normandy, on the river Meance. W. Long. o. 10. N. Lat.

ARGENT, the common French word for filver, of which metal all white fields or charges are supposed to confift. Argent of itself is used in heraldry to fignify purity, innocence, beauty, and gentleness; and, according to G. Leigh, if it is compounded with

Gul. | boldnefs; fignifies Azu. courtely; Ver. virtue; Pur. favour;] # 1 religion. Sab.

ARGENTAC, a town of France, in the Limolin, on the river Dordogne. E. Long. 2. 3. N. Lat.

ARGENTAN, a town of France, in Lower Normandy, and in the diocese of the Seez, with the title

of a marquifate. It is feated on an eminence in the Argentura middle of a fertile plain, on the banks of the river Argentina. o. 5. N. Lat. 48. 54.

ARGENTARIA, a town of ancient Gaul, thought to stand in the place where the city Colmar now stands. It is remarkable for a great victory gained by the enperor Gratian over the Lentienses, in the month of May, A. D. 378. The Romans being but few in number, were at first overpowered, and obliged to give ground; but soon returning to the charge, they gained in the end a complete victory. Thirty thousand of the barbarians, and among the rest their king Triarius, were killed on the spot; and all the rest, except 5000, taken prisoners.

ARGENTARIA Creta, pure white earth, found in Prussia, and much esteemed for cleaning plate.

ARGENTARIUS is frequently used in Roman writers for a money changer or banker. The argentarii were monied people, who made a profit either by the changing, or lending of money at interest. These had their taberna, or offices, in the forum Romanum, built there as early as the reign of L. Tarquinius Prifcus. The argentarii and fœneratores were much hated on accounted of their covetousness and extortion.

ARGENTATI MILITES, in antiquity. Livy, Lib. VI. speaks of argentati milites, as distinguished from aurati. Aquinas supposes these to have been similar to the argyraspides and chrysaspides; but the descriptions do not quadrate. Livy only represents the argentati as clothed in white linen coats.

ARGENTEUIL, a town of the Isle of France. feated on the river Seine, five miles north-west of Paris. It is a very beautiful place, with fine vineyards. In the environs are quarries of flucco. In the Benedictine priory they pretend to have the feamless coat of Christ. E. Long. 2. 28. N. Lat. 48. 52.

ARGENTIERE, a small island in the Archipelago, near Milo. It is about 18 miles in compals; and is full of barren mountains, producing nothing but barley, cotton, and a few grapes fit only for eating. The barley and cotton are fown round the only village there is in the island. The ladies are handsome enough, have no other employment but making cotton stockings, and take up with the failors who put into the port. The men all use the sea, and in time become good pilots. They have very little religion, are very ignorant, and of very bad morals. Justice is administered by an itinerant cadi, who is sometimes the only Mussulman in the whole island. The only article relating to natural history is the terra Cimolia so highly esteemed by the ancients; it is a kind of white chalk, which is very heavy, without taste, and crumbles easily : they use it in washing linen. E. Long. 23. 10. N. Lat. 36. 50.

ARGENTINA, in ichthyology, a genus of fashes belonging to the order of abdominules. The generic characters are these: The teeth are in the tongue as well as the jaws; the branchioflege membrane has eight radii or rays; the anus is near the tail; and the belly fins confift of many rays. There are two species of argentina, viz. 1. The sphyrmena has 15 rays in the fin at the anus; the air bladder of this species is conical on both fides, and fhines like filver: according to Mr Ray, salse pearls are sometimes made of it. 2. The carolina has likewife 15 rays in the fin near the anus;

fignifies eleven, LXV fixty-five, MDCXXVIII one thousand fix hundred and twenty-eight.

3d, When a numeral letter of leffer value is placed before one of greater, the value of the leffer is taken from that of the greater: thus IV fignifies four, XL forty, XC ninety, CD four hundred.

Sometimes 10 is used instead of D for 500, and the value is increased ten times by annexing of to the

right hand.

Thus ID fignifies 500. Also CCCIDD for 10000 1000 50000 CCCIDD for 100000

Sometimes thousands are represented by drawing a line over the top of the numeral, V being used for five thousand, I for fifty thousand, CC two hundred thousand.

exagefimal

About the year of Christ 200, a new kind of arithunthinetic. metic, called fexagefinal, was invented, as is supposed, by Claudius Ptolemæus. The delign of it was to remedy the difficulties of the common method, especially with regard to fractions. In this kind of arithmetic, every unit was supposed to be divided into 60 parts, and each of these into 60 others, and so on : hence any number of fuch parts were called fe agesimal fractions; and to make the computation in whole numbers more easy, he made the progression in these also sexagesimal. Thus from one to 99 were marked in the common way: then 60 was called a fenagefima prima, or first fexagefimal integer, and had one fingle dash over it; fo 60 was expressed thus I'; and so on to 50 times 60, or 3540, which was thus expressed LIX'. He now proceeded to 60 times 60, which he called a fexagefima fecunda, and was thus expressed I". In like manner, twice 60 times 60, or 7200, was expressed by II"; and fo on till he came to 60 times 3600, which was a third fexagefimal, and expressed thus, I". If any number less than 60 was joined with these sexagesimals, it was added in its proper characters without any dash; thus l'XV represented 60 and 15, or 75; I'VXXV is four times 60 and 25, or 26; X"II'XV, is ten times 3600, twice 60 and 15, or 30,135, &c. Sexagesimal fractions were marked by putting the dash at the foot, or on the left hand of the letter; thus I, or I denoted at I In or "I, 75000 &c.

The most perfect method of notation, which we adian Chaderswhen now use, came into Europe from the Arabians, by rought in the way of Spain. The Arabs, however, do not pretend to be the inventors of them, but acknowledge that they received them from the Indians. there are indeed, who contend that neither the Arabs nor the Indians were the inventors, but that they were found out by the Greeks. But this is by no means probable; as Maximus Planudes, who lived towards the close of the 13th century, is the first Greek who makes use of them: and he is plainly not the inventor; for Dr Wallis mentions an inscription on a chimney in the parsonage house of Helendon in Northamptonshire, where the date is expressed by Mo 133, insteadof 1133. Mr Luffkin furnishes a still earlier instance of their use, in the window of a house, part of which is a Roman wall, near the market place in Colchester; where between two carved lions stands an escutcheon with the figures 1000. Dr Wallis is of opinion that

Vol. II. Part I.

1

these characters must have been used in England at least as long ago as the year 1050, if not in ordinary affairs, at least in mathematical ones, and in astronomical tibles. How these characters came to be originally invented by the Indians we are entirely ignorant.

The introduction of the Arabian characters in notation did not immediately put an end to the fexagefimal arithmetic. As this had been used in all the astronomical tables, it was for their sakes retained for a confiderable time. The fexagefimal integers went first out, but the fractions continued till the invention

of decimals.

The oldest treatifes, extant upon the theory of arith-Treatmeson metic are the feventh, eighth, and ninth books of Eu-Arithmene. clid's Elements, where he tr ats of proportion and of prime and composite numbers; both of which have received improvements fince his time, especially the former. The next, of whom we know any thing, is Nicomachus the Pythagercan, who wrote a treatife of the theory of authmetic, confilling chiefly of the distinctions and divisions of numbers into classes, as plain, folid, triangular, quadrangular, and the rest of the sigurate numbers as they are called, numbers odd and even, &c. with some of the more general properties of the feveral kinds. This author 13, by fome, faid to have lived before the time of Euclid; by others, not long after. His arithmetic was published at Paris in 1538. The next remarkable writer on this subject is Boethius, who lived at Rome in the time of Theodoric the Goth. He is supposed to have copied most of his work from Nicomachus.

From this time no remarkable writer on arithmetic appeared till about the year 1200, when Jordanus of Namur wrote a treatife on this subject, which was published and demonstrated by Joannes Faber Stapulengs in the 15th century, foon after the invention of printing. The fame author also wrote upon the new art of computation by the Arabic figures, and called this book Algorifmus Demonstratus. Dr Wallis fays, this manufcript is in the Savillian library at Oxford, but it hath never yet been printed. As learning advanced in Europe, so did the knowledge of numbers ; and the writers on arithmetic foon became innumerable. About the year 1464, Regiomontanus, in his triangular tables, divided the radius into 10,000 parts, instead of 60,000; and thus tacitly expelled the fexagefimal arithmetic. Part of it, however, full remains in the division of time, as of an hour into 60 minutes, a minute into 60 seconds, &c. Ramus m his arithmetic, written about the year 1550, and published by Lazarus Schonerus in 1586, uses decimal periods in carrying on the fquare and cube roots to The same had been done before by our countrymen Buckley and Record; but the first who published an express treatise on decimals was Simon Stevinius, about the year 1582. As to the circulating decimals, Dr Wallis is the first who took much notice of them. He is also the author of the arithmetic of infinites, which has been very usefully applied to The greatest improvement, however, geometry. which the art of computation ever received, is the invention of logarithms. The honour of this invention is unquestionably due to Baron Napier of Merchiston in Scotland, about the end of the 16th or O o

ARITHMETIC

otation, beginning of the 17th century. By these means arithmetic has advanced to a degree of perfection which meration the ancients could never have imagined possible, much less hoped to attain; and we believe it may now be reckoned one of those few sciences which have arrived at their utmost height, and which is in its nature capable of little further improvement.

CHAP. I. NOTATION AND NUMERATION.

THE first elements of arithmetic are acquired during our infancy. The idea of one, though the fimplett of any, and fuggefted by every fingle object, is perhaps rather of the negative kind, and confifts partly in the exclusion of plurality, and is not attended to till that of number be acquired. Two is formed by placing one object near another; three, four, and every higher number, by adding one continually to As we thus advance from the former collection. lower numbers to higher, we foon perceive that there is no limit to this increasing operation; and that, whatever number of objects be collected together, more may be added, at least, in imagination; so that we can never reach the highest possible number, nor approach near it. As we are led to understand and add numbers by collecting objects, fo we learn to diminish them by removing the objects collected; and if we remove them one by one, the number decreases through all the steps by which it advanced, till only one remain, or none at all. When a child gathers as many stones together as suits his fancy, and then throws them away, he acquires the first elements of the two capital operations in arithmetic. The idea of numbers, which is first acquired by the observation of sensible objects, is afterwards extended to measures of space and time, affections of the mind, and other immaterial qualities.

Small numbers are most easily apprehended: a child foon knows what two and what three is; but has not any diffinct notion of seventeen. Experience removes this difficulty in some degree; as we become accustomed to handle larger collections, we apprehend clearly the number of a dozen or a fcore; but perhaps could hardly advance to an hundred without the aid of classical arrangement, which is the art of forming so many units into a class, and so many of these classes into one of a higher kind, and thus advancing through as many ranks of classes as occasion requires. If a boy arrange an hundred stones in one row, he would be tired before he could reckon them; but if he placed them in ten rows of ten stones each, he will reckon an hundred with cases and if he collect ten fuch parcels, he will reckon a thousand. In this case, ten is the lowest class, a hundred is a class of the fecond rank, and a thousand is a class of the third

There does not feem to be any number naturally adapted for constituting a class of the lowest, or any higher rank, to the exclusion of others. However, as ten has been univerfally used for this purpose by the Hebrews, Greeks, Romans, and Arabians, and by all nations who have cultivated this science, it is probably the most convenient for general use. Other scales, however, may be assumed, perhaps on some occa-

fions, with fuperior advantage; and the principles of Numeration arithmetic will appear in their full extent, if the fludent can adapt them to any scale whatever: thus, if eight were the scale, 6 times 3 would be two classes and two units, and the number 18 would then be represented by 22. If 12 were the scale, 5 times 9 would be three classes and nine units, and 45 would be reprefented by 39, &c.

It is proper, whatever number of units constitutes a class of the lower rank, that the same number of each class should make one of the next higher. This is observed in our arithmetic, ten being the universal scale; but it is not regarded in the various kinds of monies, weights, and the like, which do not advance by any universal measure; and much of the difficulty in the practice of arithmetic arises from that irregularity.

As higher numbers are somewhat difficult to apprehend, we naturally fall on contrivances to ax them in our minds, and render them familiar: but notwithstanding all the expedients we can fall upon, our ideas of high numbers are still imperfect, and generally far short of the reality; and though we can perform any computation with exactness, the answer we obtain is often incompletely apprehended.

It may not be amis to illustrate, by a few examples, the extent of numbers which are frequently named without being attended to. If a person employed in telling money reckon an hundred pieces in a minute, and continue at work ten hours each day, he will take seventeen days to reckon a million; a thousand men would take 45 years to reckon a bil-lion. If we suppose the whole earth to be as well peopled as Britain, and to have been to from the creation, and that the whole race of mankind had constantly spent their time in telling from a heap confishing of a quadrillion of pieces, they would hardly have yet reckoned the thousandth part of that

All numbers are represented by the ten following characters.

5 6 7 One, two, three, four, five, fix, feven, eight, nine, cypher. The nine first are called fignificant figures, or digits; and fometimes represent units, sometimes tens, hundreds, or higher classes. When placed fingly, they denote the simple numbers subjoined to the characters. When leveral are placed together, the first or right hand figure only is to be taken for its simple value: the second signifies so many tens, the third so many hundreds, and the others fo many higher classes, according to the order they stand in. And se it may fometimes be required to express a number confifting of tens, hundreds, or higher classes, without any units or classes of a lower rank annexed; and so this can only be done by figures standing in the fecond, third, or higher place, while there are none to fill up the lower ones; therefore an additional character or cypher (o) is negellary, which has no fignification when placed by itself, but serves to supply the vacant places, and bring the figures to their proper

The following table shows the names and divisions of the claffes.

Thoufand billions:
Hundred billions:
Ten billions ® undred thousand of billions.
Ten thousand of billions. BILLIONS
Hundred thousand of millions Ten thousand of millions • Hundred millions Ten thousands-Thousand millionst Ten millions. Thousand BILLIONS

The first fix figures from the right hand are calle the unit period, the next fix the million period, after which the trillion, quadrillion, quintillion, fextillion, septillion, ostillion, and nonillion periods follow in their order.

It is proper to divide any number, before we reckon it into periods and half periods, by different marks. We then begin at the left hand, and read the figures in their order, with the names of their places, from the table. In writing any number, we must be careful to mark the figures in their proper places, and supply the vacant places with cyphers.

As there are no possible ways of changing numbers, except by enlarging or diminishing them according to fome given rule, it follows, that the whole art of arithmetic is comprehended in two operations, Addition and Subtraction. However, as it is frequently required to add feveral equal numbers together, or to fubtract feveral equal ones from a greater, till it be exhausted, proper methods have been invented for facilitating the operation in these cases, and distinguished by the names of Multiplication and Division; and these four rules are the foundation of all arithmetical operations

As the idea of number is acquired by observing several objects collected, so is that of fractions by observing an object divided into several parts. As we sometimes meet with objects broken into two, three, or more parts, we may confider any or all of these divisions promiscuously, which is done in the doctrine of vulgar fractions, for which a chapter will be allotted. However, fince, the practice of collecting units into parcels of tens has prevailed univerfally, it has been found convenient to follow a like method in the confideration of fractions, by dividing each unit into ten equal parts, and each of these into ten smaller parts; and so on. Numbers divided in this manner are called Decimal Fractions.

CHAP. II. ADDITION.

ADDITION is that operation by which we find the amount of two or more numbers. The method of doing this in simple cases is obvious, as soon as the meaning of number is known, and admits of no illustration. A young learner will begin at one of the numbers, and reckon up as many units separately as there are in the other, and practice will enable him to do it at once. It is impossible, strictly speaking, to add more than two numbers at a time. We must first find the sum of the first and second; then we add the third to that number; and so on. However, as the

feveral fums obtained are easily retained in the memo- Addition ry, it is neither necessary nor usual to mark them down. When the numbers confilt of more figures than one, we add the units together, the tens together, and fo on. But if the fum of the units exceed ten, or contain ten feveral times, we add the number of tens it contains to the next column, and only fet down the number of units that are over. In like manner we carry the tens of every column to the next higher. And the reason of this is obvious from the value of the places; fince an unit, in any higher place, fignifies the fame thing as ten in the place immediately lower.

Rule. "Write the numbers diffinctly. " units under units, tens under tens; and " fo on. Then reckon the amount of the " right hand column. If it be under ten, " mark it down. If it exceed ten, mark " the units only, and carry the tens to the " next place. In like manner, carry the " tens of each column to the next, and mark " down the full fum of the left hand co- 3092234 " lumn."

24433

As it is of great consequence in business to perform addition readily and exactly, the learner ought to practice it till it become quite familiar. If the learner can readily add any two digits, he will foon add a digit to a higher number with equal ease. It is only to add the unit place of that number to the digit; and, if it exceed ten, it raifes the amount accordingly. Thus, because 8 and 6 is 14, 48 and 6 is 54. It will be proper to mark down under the fums of each column, in a fmall hand, the figure that is carried to the next column. This prevents the trouble of going over the whole operation again, in case of interruption or mistake. If you want to keep the account clean, mark down the fum and figure you carry on a separate paper, and, after revising them, transcribe the fum only. After fome practice, we ought to acquire the habit of adding two or more figures at one glance. This is particularly useful when two figures which amount to 10, as 6 and 4, or 7 and 3 stand together in the column.

Every operation in arithmetic ought to be revised, to prevent mistakes; and as one is apt to fall into the fame mistake, if he revise it in the same manner he performed it, it is proper either to alter the order, or elfe to trace back the steps by which the operation advanced, which will lead us at last to the number we began with. Every method of proving accounts may be referred to one or other of these heads.

1st, Addition may be proven by any of the following methods: Repeat the operation, beginning at the top of the column, if you began at the foot when you

2d, Divide the account into several parts; add these separately, and then add the sums together. If their amount correspond with the sum of the account, when added at once, it may be prefumed right. This method is particularly proper when you want to know the fums of the parts, as well as that of the whole.

3d, Subtract the numbers successively from the sum; if the account be right, you will exhaust it exactly, and find no remainder.

When the given number confifts of articles of different value, as pounds, shillings, and pence, or the like, which are called different denominations, the operations in arithmetic must be regulated by the value of the articles. We shall give here a few of the most ufeful tables for the learner's information.

II. Avoirdupois Weight. I. Sterling Money. 4 Farthings=1 penny, 16 Drams=1 ounce, oz. marked d. 16 Ounces=1 pound, lb. 12 Pence=1 shilling, s. 28 Pound=1 quarter, qr. 20 Shillings=1 pound, L. 4 Quart.=1 hun. wght, C. Alfo, 6s. 8d.=1 noble 108.= 1 angel 138. 4d. or two thirds of a pound=1 merk.

Scots money is divided in the same manner as sterling, and has one twelfth of its value. A pound Scots is equal to 1s. 8d. sterling, a shilling Scots to a penny sterling, and a penny Scots to a twelith part of a penny, sterling; a mark Scots is two thirds of a

pound Scots, or 137 sterling III. Troy Weight. 20 Mites=1 grain, gr. 24 Grains=1 pen. wt, dwt. 3 Scruples=1 dram, 3 20 Penny wts = 1 ounce, oz. 12 Ounces=1 pound, lib, V. English Dry Measure. 2 Pints=1 quart 4 Quarte=1 gallon

2 Gallons=1 peck 4 Pecks=1 bushel 8 Bushels=1 quarter VII. English Land Meafure.

301 Square yards=1 pole or perch 40 Polca= 1 rood

4Roods=1 acre IX. Long Meafure. 12 Inches=1 foot 3 Feet=1 yard

5 + yards=1 pole 40 Poles=1 furlang 8 Furlongs=1 mile

3 Miles=1 league.

X. Time. 60 Seconds=1 minute. 60 Minutes=1 hour 24 Hours=1 day 7 Days=1 week

365 Days=1 year 52Weeks&1day=1year

Rule for compound Addition. " Arrange like quan-" tities under like, and carry according to the value " of the higher place."

Note 1. When you add a denomination, which contains more columns than one, and from which you carry to the higher by 20, 30, or any even number of tens, first add the units of that column, and mark down their fum, carry the tens to the next column; then add the tens, and carry to the higher denomination, by the number of tens that it contains of the lower. For example, in adding shillings, carry by 10 from the units to the tens, and by 2 from the tens to the pounds.

Note 2. If you do not carry by an even number of tens, first find the complete sum of the lower denomination, then inquire how many of the higher that fum contains, and carry accordingly, and mark the remainder, if any, under the column. For example, if the

fum of a column of pence be 43, which is three shil- Addition. lings and feven pence, mark 7 under the pence column, and carry 3 to that of the shillings.

Note 3. Some add the lower denominations after the following method: when they have reckoned as many as amounts to one of the higher denomination, or upwards, they mark a dot, and begin again with the excess of the number reckoned above the value of the denomination. The number of dots shows how many are carried, and the last reckoned number is placed under the column.

When one page will not contain the whole account, we add the articles it contains, and write against their fum Carried forward; and we begin the next page with the fum of the foregoing, writing against it, Brought forward.

When the articles fill feveral pages, and their whole fum is known, which is the case in transcribing accounts, it is best to proceed in the following manner: Add the pages, placing the fums on a separate paper; then add the fums, and if the amount of the whole be right, it only remains to find what number should be placed at the foot and top of the pages. For this purpole, repeat the fum of the first page on the same line; add the sums of the first and second, placing the amount in a line with the second; to this add the fum of the third, placing the amount in a line with the third. Proceed in the like manner with the others; and if the last sum corresponds with the amount of the page, it is right. These sums are transcribed at the foot of the respective pages, and tops of the following oncs.

Examples.

L.1419 17 1

6 11

Then we transcribe 7781. 168. at the foot of the first and top of the second pages, 12241. 108. 5d. at the foot of the second and top of third; and so on.

CHAP. III. SUBTRACTION.

Subtraction is the operation by which we take a leffer number from a greater, and find their difference. It is exactly opposite to addition, and is performed by learners in a like manner, beginning at the greater, and reckoning downwards the units of the leffer. The greater is called the minuend, and the leffer the fubirahend.

If any figure of the subtrahend be greater than the corresponding figure of the minuend, we add ten to that of the minuend, and having found and marked trahend. This is called borrowing ten. The reason will appear, if we consider that, when two numbers are equally increased by adding the same to both, their difference will not be altered. When we proceed as directed above, we add ten to the minuend, and we likewise add one to the higher place of the subtrahend, which is equal to ten of the sower place.

RULE. Subtract units from units, tens from tens, and so on. If any figure of the subtrahend be greater than the corresponding one of the minuend, borrow ten."

Example. Minuend 173694 738641 Subtrahend 21453 379235

Remainder 152241 359406
To prove libtraction, add the subtrahend and remainder together; if their sum be equal to the minuend, the account is right.

Or subtract the remainder from the minuend. If the difference be equal to the subtrahend, the account is right.

Rulz for compound fubtraction. "Place like deno-"minations under like; and borrow, when necessary, "according to the value of the higher place."

		_	•	Ex	amp	les.				
						lib.	A.	<i>R.</i> .	F.	E.
Ŀ	.146	3	3			19	15	2	24	18
	58	7	ğ.	4	3	24	12	2	36	· 7
L	. 87	15	9	7	3	23	2	3	28	11
	Note	1. 1	The r	eafon	for	borrow	ing is	the	fam	e as

in simple subtraction. Thus, in subtracting pence, we

add 12 pence when accessary to the minuend, and at Subrit the next step, we add one shilling to the subtrahend.

Note 2. When there are two places in the same denomination, if the next higher contain exactly so many tens, it is best to subtract the units sirst, borrowing ten when necessary; and then subtract the tens, borrowing, if there is occasion, according to the number of tens in the higher denomination.

Note 3. If the value of the higher denomination be not an even number of tens, subtract the units and tens at once, borrowing according to the value of the higher denomination.

Note 4. Some choose to subtract the place in the subtrahend, when it exceeds that of the minuend, from the value of the higher denomination, and add the mi-

nuend to the difference. This is only a different order of proceeding, and gives the same answer.

Note 5. As custom has established the method of placing the subtrahend under the minuend, we follow it when there is no reason for doing otherwise; but the minuend may be placed under the subtrahend with equal propriety; and the learner should be able to work it either way, with equal readiness, as this last is sometimes more convenient; of which instances will occur afterwards.

Note 6. The learner should also acquire the habit when two numbers are marked down, of placing such a number under the lesser, that, when added together, the sum may be equal to the greater. The operation is the same as subtraction, though conceived in a different manner, and is useful in balancing accounts, and on other occasions.

It is often necessary to place the sums in different columns, in order to exhibit a clear view of what is required. For instance, if the values of several parcels of goods are to be added, and each parcel consists of several articles, the particular articles should be placed in an inner column, and the sum of each parcel extended to the outer column, and the total added there.

If any person be owing an account, and has made some partial payments, the payments must be placed in an inner column, and their sum extended under that of the account in the outer column, and subtracted there.

An example or two will make this plain.

CHAP.

CHAP. IV. MULTIPLICATION.

In Multiplication, two numbers are given, and it is required to find how much the first amounts to, when reckoned as many times as there are units in the fecond. Thus, 8 multiplied by 5, or 5 times 8, is 40. The given numbers (8 and 5) are called fattors; the first (8) the multiplicand; the second (5) the multiplier; and the amount (40) the product.

This operation is nothing else than addition of the fanic number several times repeated. If we mark 8 five times under each other, and add them, the fum is 40: But, as this kind of addition is of frequent and extensive use, in order to shorten the operation, we mark down the number only once, and conceive it to be repeated as often as there are units in the multiplier.

For this purpose, the learner must be thoroughly acquainted with the following multiplication table, which is composed by adding each digit twelve times.

T	vice	T	hric	e []	Pour	r time	s Fiv	ctime		time:	Seve	n times
1 i	8 2	1	is	3	I	is 4	I	is 5	1	is 6	1	is 7

12	96	5	I 2	10	3 j 1	2	120	12	1	32 1	2	144

If both factors be under 12, the table exhibits the product at once. If the multiplier only be under 13, we begin at the unit place, and multiply the figures in their order, carrying the tens to the higher place, as in addition.

Ex. 76859 multiplied by 4, or 76859 added 4 times.

4 307436	76859 7685 9 76859				
· / · · ·	307436				

If the multiplier be 10, we annex a cypher to the multiplicand. If the multiplier be 100, we annex two cyphers; and fo on. The reason is obvious, from the

use of exphere in notation.

If the multiplier be any digit, with one or more cyphers on the right hand, we multiply by the figure, and annex an equal number of cyphers to the product. Multipli-Thus, if it be required to multiply by 50, we first cation. multiply by 5, and then annex a cypher. It is the fame thing as to add the multiplicand fifty times; and this might be done by writing the account at large, dividing the column into 10 parts of 5 lines, finding the fum of each part, and adding these ten sums together.

If the multiplier confift of feveral figuificant figures, we multiply separately by each, and add the products. It is the fame as if we divided a long account of addition into parts corresponding to the figures of the multiplier.

E	Example.	To multiply	7329 by 365.
7329 5	7329 60	7329 300	36645 = 5 times. 439740 = 60 times.
26645	420740	2198700 -	2198700 = 300 times.
30045	439/40	2190700 -	2675085 = 365 times.

It is obvious that 5 times the multiplicand added to 60 times, and to 300 times, the same must amount to the product required. In practice, we place the products at once under each other; and as the cyphers arising from the higher places of the multiplier, are loft in the addition, we omit them. Hence may be inferred the following

RULE. " Place the multiplier under the multipli-" cand, and multiply the latter successively by the " fignificant figures of the former; placing the right " hand figure of each product under the figure of the " multiplier from which it arises; then add the pro-" duct."

Ex.	7329 365	42785	37846 235.	93956 8704
	36645 43974 1987	42785 385065	189230 113538 75692	375824 657692 751648
26	75085	3893435	8893810	817793024

A number which cannot be produced by the multiplication of two others is called a prime number; as 3, 5, 7, 11, and many others.

A number which may be produced by the multi-plication of two or more fmaller ones, is called a composite number. For example, 27, which arises from the multiplication of 9 by 3; and these numbers (9 and 3) are called the component parts of 27.

Contractions and Varieties in Multiplication.

First, If the multiplier be a composite number, we may multiply fuccessively by the component parts.

<i>Lx.</i> 7038	my 45 or 5 times 9	7038 IR,	5492 by	72
45		9 2d,	13759 by	56
-		3d,	56417 by	144
38190		68742 4th,	73048 by	84
30552		5 5th,	166549by	125
	•••	——— 6th,	378914by	54
343710	3.	437107th,	520813 by	63

Because the second product is equal to five times the first, and the first is equal to nine times the multiplicand, TH

Multipli- plicand, it is obvious that the second product must be cation. five times nine, or forty-five times as great as the multiplicand.

Secondly, If the multiplier be 5, which is the half of 10, we may annex a cypher and divide by 2. If it be 25, which is the fourth part of 100, we may annex two cyphers, and divide by 4. Other contractions of the like kind will readily occur to the

Thirdly, To multiply by 9, which is one less than 10, we may annex a cypher; and fubtract the multiplicand from the number it composes. To multiply by 99,999, or any number of 9's, annex as many cyphers, and fubtract the multiplicand. The reason is obvious; and a like rule may be found, though the unit place be different from o.

Fourthly, Sometimes a line of the product is more easily obtained from a former line of the same than from the multiplicand?

In the first example, instead of multiplying by 5, we may multiply 5488 by 2; and, in the second, instead of muliplying by 3, we may divide 8088 by 2.

Fifthly, Sometimes the product of two or more figures may be obtained at once, from the product of a figure already found.

In the second example, we multiply first by 4; then, because 12 times four is 48, we multiply the first line of the product by 12, instead of multiplying separately by 8 and 4; lastly, Because twice 48 is 96, we multiply the second line of the product by 2, instead of multiplying separately by 6 and 9.

When we follow this method, we must be careful to place the right hand figure of each product under the right hand figure of that part of the multiplier which it is derived from.

It would answer equally well in all cases, to begin the work at the highest place of the multiplier; and contractions are fometimes obtained by following that order.

It is a matter of indifference which of the factors Multima be used as the multiplier; for 4 multiplied by 3 gives cation? the same product as 3 multiplied by 4; and the like holds univerfally true. To illustrate this, we may mark three rows of points, four in each . . . row, placing the rows under each other; . . . and we shall also have four rows, con- taining three points each, if we reckon the rows downwards.

Multiplication is proven by repeating the operation, using the multiplier for the multiplicand, and the multiplicand for the multiplier. It may also be proven by division, or by casting out the 9's; of which afterwards; and an account, wrought by any contraction, may be proven by performing the operation at large, or by a different contraction.

Compound Multiplication.

RULE I. " If the multiplier do not exceed 12, the "operation is performed at once, beginning at the " lowest place, and carrying according to the value of " the higher place."

RULE II. " If the multiplier be a composite num-" ber, whose component parts do not exceed 12, mul-" tiply first by one of these parts, then multiply the " product by the other. Proceed in the same manner " if there be more than two."

Note 1. Although the component parts will anfwer in any order, it is best, when it can be done, to take them in fuch order as may clear off some of the lower places at the first multiplication, as is done in

Note 2. The operation may be proved, by taking the component parts in a different order, or dividing the multiplier in a different manner.

RULE III. "If the multiplier be a prime number, " multiply first by the composite number next lower, "then by the difference, and add the products."

sation.

35 17 9by67=64+3 Here because 8 times 8

8 64= 8 × 8 is 64, we multiply twice
by 8, which gives 2296l.

L. 287 2 - =8 times.

L.2296 16 - = 64 times. 107 13 3 = 3 times.

L.2404 9 3 =67 times.

is 64, we multiply twice by 8, which gives 22961. 16s. equal to 64 times the multiplicand; then we find the amount of 3 times the multiplicand, which is 1071. 13s. 3d.; and it is evident that these added, amount to 67, the multiplicand.

RULE IV. "If there be a composite number a lit"tle above the multiplier, we may multiply by that
"number, and by the difference, and subtract the
"fecond product from the sirst."

L. 17 4 5by 106=108-2 Here we multiply

L. 206 13 -9

L. 1859 17 -= 108 times. 34 8 10= 2 times.

L. 1825 8 2=106 times.

Here we multiply by 12 and 9, the component parts of 108, and obtain a product of 1860l. 6s. equal to 108 times the multiplicand; and, as this is twice oftener than was required, we subtract the multiplicand doubled, and the remainder is the num-

ber fought. Example. 341. 88. 27d. by 3466.

RULE V. "If the multiplier be large, multiply by 10, and multiply the product again by 10; by which means you obtain an hundred times the given number. If the multiplier exceed 1000, multiply by 10 again; and continue it farther if the multiplier require it; then multiply the given number by the unit-place of the multiplier; the first product by the ten-place, the second product by the hundred-place; and so on. Add the products thus obtained together."

L. 34 8 2½by 5=L. 172 1 0½= 5 times

10

Otimes L. 344 2 1 by 6 = 2064 12 6 = 60 times

100 times L. 3441 - 10 by 4= 13764 3 4 = 400 times

1000 times L. 34410 8 4by3 = 103231 5- = 3000 times

L. 119232 9 roi = 3465 times

The use of multiplication is to compute the amount of any number of equal articles, either in respect of measure, weight, value, or any other consideration. The multiplicand expresses how much is to be reckoned for each article; and the multiplier expresses how many times that is to be reckoned. As the multiplier points out the number of articles to be added, it is always an abstract number, and has no reference to any value or measure whatever. It is therefore quite improper to attempt the multiplication of shillings by shillings, or to consider the multiplier as expressive of any denomination. The most common instances in which the practice of this operation is required, are, to find the amount of any number of parcels, to find the value of any number of articles, to find the weight or measure of a number of articles, &c.

This computation, for changing any fum of money, Division weight, or measure, into a different kind, is called REDUCTION. When the quantity given is expressed in different denominations, we reduce the highest to the next lower, and add thereto the given number of that denomination; and proceed in like manner till we have reduced it to the lowest denomination.

Example. To reduce 461. 138. 8 d. to farthings.

1., 46 20	Or thus:
920 shillings in L. 46	L. 46 13 81 20
933 shillings in L. 46 13	933
11196 pence in L. 46 13	11204
11204 pence in . L. 46 13 8	44819
44186 farthings in L. 46 13 8	

44819 farthings in L. 46 13 81.
It is easy to take in or add the higher denomination at the same time we multiply the lower.

CHAP. V. DIVISION.

In division, two numbers are given; and it is quired to find how often the former contains the ter. Thus, it may be asked how often 21 contains 7, and the answer is, exactly 3 times. The former given number (21) is called the Dividend; the latter (7) the Divisor; and the number required (3) the Quotient. It frequently happens that the division cannot be completed exactly without fractions. Thus it it may be asked, how often 8 is contained in 19? the answer is twice, and the remainder of 3.

This operation confifts in subtracting the divisor from the dividend, and again from the remainder, as often as it can be done, and reckoning the number of subtractions; as,

7 first subtraction
7 second subtraction
7 third subtraction.
119 first subtraction
121
8 first subtraction
121
8 fecond subtraction
3 remainder.
7 third subtraction.

As this operation, performed at large, would be very tedious, when the quotient is a high number, it is proper to shorten it by every convenient method; and, for this purpose, we may multiply the divisor by any number whose product is not greater than the dividend, and so subtract it twice or thrice, or oftener, at the same time. The best way is to multiply it by the greatest number, that does not raise the product too high, and that number is also the quotient. For example, to divide 45 by 7, we inquire what is the greatest multiplier for 7, that does

Division. not give a product above 45; and we shall find that it is 6; and 6 times 7 is 42, which, subtracted from 45, leaves a remainder of 3. Therefore 7 may be subtracted 6 times from 45; or, which is the same thing, 45, divided by 7, gives a quotient of 6, and a remainder of 3.

> If the divisor do not exceed 12, we readily find the highest multiplier that can be used from the multiplication table. If it exceed 12, we may try any multiplier that we think will answer. If the product be greater than the dividend, the multiplier is too great; and, if the remainder, after the product is subtracted from the dividend, be greater than the divisor, the multiplier is too small. In either of these cases, we must try another. But the attentive learner, after fome practice, will generally hit on the right multiplier at first.

> If the divisor be contained oftener than ten times in the dividend, the operation requires as may steps as there are figures in the quotient. For instance, if the quotient be greater than 100, but less than 1000, it requires 3 steps. We first inquire how many hundred times the divisor is contained in the dividend, and subtract the amount of these hundreds. Then we inquire how often it is contained ten times in the remainder, and fubtratt the amount of these tens. Lastly, We inquire how many fingle times it is contained in the remainder. The method of proceeding will appear from the following example:

To divide 5936 by 8. From 5936 5000=700 times 8

Rem. 336 From which take 320 = 40 times 8

Rem. From which take 16 = 2 times 8

748 times 8 in all.

It is obvious, that as often as 8 is contained in 59, formany hundred times it will be contained in 1000. or in 1936; and, as often as it is contained in 33, fo many ten times it will be contained in 330, or in 3363 and thus the higher places of the quotient will be obtained with equal case as the lower. The operation might be performed by subtracting 8 continually from the dividend, which will lead to the same conclusion by a very tedious process. After 700 subtractions, the remainder would be 336; after 40 more, it would be 16; and after 2 more, the dividend would be entirely exhausted. In practice, we omit the cyphers, and proceed by the following

RULES. 1st, " Assume as many figures on the left " hand of the multiplier as contain the divilor once " or oftener: find how many times they contain it, " and place the answer as the highest figure of the * quotient.

2d, " Multiply the divisor by the figure you have " found, and place the product under the part of the "dividend from which it is obtained.

3d, " Subtract the product from the figures above it. 4th, " Bring down the next figure of the dividend " to the remainder, and divide the number it makes "up, as before."

Remainder

The numbers which we divide, as 59, 33, and 16, in the first example, are called dividuals.

It is usual to mark a point under the sigures of the dividend, as they are brought down, to prevent miftakes.

If there be a remainder, the division is completed by a vulgar fraction, whose numerator is the remainder, and its denominator the divisor. Thus, in Ex. 3. the quotient is 2671, and the remainder 17; and the quotient completed is 2671 177.

A number which divides another without a remainder is faid to measure it; and the several numbers which measure another, are called its aliquot parts. Thus, 2, 4, 6, 8, and 12, are aliquot parts of 24. As it is often useful to discover numbers which meafure others, we may observe,

1st, Every number ending with an even figure, that is, with 2, 4, 6, 8, or 0, is measured by 2.

2d, Every number ending with 5, or 0, is measur-

ed by 5; 3d, Every number, whose figures, when added, a-3 or 9, respectively.

Contractions and Varieties in Division.

First, When the divisor does not exceed 12, the whole computation may be performed without fetting down any figures except the quotient.

Secondly, When the divisor is a composite number, and one of the component parts also measures the dividend, we may divide successively by the component parts.

This method might be also used, although the component parts of the divisor do not measure the dividend; but the learner will not understand how to

manage

08 Divition.

wison manage the remainder till he be acquainted with the doctrine of vulgar fractions.

Thirdly, When there are cyphers annexed to the divisor, cut them off, and cut off an equal number of figures from the dividend; annex these figures to the remainder.

Ex. To divide 378643 by 5200.

To divide 378643 by 526 52|00)3786|43(721263 364 146 104

4243

The reason will appear by performing the operation at large, and comparing the steps.

To divide by 10, 100, 1000, or the like. Cut off as many figures on the right hand of the dividend as there are cyphers in the divifor. The figures which remain on the left hand compose the quotient, and the figures cut off compose the remainder.

Fourthly, When the divifor confilts of feveral figures we may try them separately, by inquiring how often the first sigure of the divifor is contained in the first sigure of the dividend, and then confidering whether the second and following sigures of the divisor be contained as often in the corresponding ones of the dividend with the remainder (if any) prefixed. If not, we must begin again, and make trial of a lower number. When the remainder is nine, or upwards, we may be fure the division will hold through the lower places; and it is necessary to continue the trial farther.

Fifthly, We may make a table of the products of the divisor, multiplied by the nine digits, in order to discover more readily how often it is contained in each dividual. This is convenient when the dividend is very long, or when it is required to divide frequently by the same divisor.

Sixthly, To divide by 9, 99, 999, or any number of 9's, transcribe under the dividend part of the fame, this ting the highest figure as many places to the right hand as there are 9's in the divisor. Transcribe it again, with the like change of place, as often as the kragth of the dividend admits; add these together, and cut off as many figures from the right hand of the sum as there are 9's in the divisor. The

figures which remain on the left hand compose the Division. quotient, and those cut off the remainder.

If there be any carriage to the unit place of the quotient, add the number carried likewise to the remainder, as in Ex. 2.; and if the figures out off be all 9's, add 1 to the quotient, and there is no remainder.

Examples. 1st.] 99) 324123 2d.] 99) 547825 5478 32 5478 32 5478 3273 96 5533 57 Quotient 3273 and rem. 96.

Quotient 5333.58 rem.

3d.] 999)476523 476 476|999

Quotient 477

To explain the reason of this, we must recoilect, that whatever number of hundreds any dividend contains, it contains an equal number of 99's, together with an equal number of units. In Ex. 1. the dividend contains 3241 hundreds, and a remainder of 23. It therefore contains 3241 times 99, and also 3241, besides the remainder already mentioned.—Again, 3241 contains 32 hundreds, and a remainder of 51: it therefore contains 32 99's, and also 32, besides the remainder of 41. Consequently the dividend contains 99, altogether, 3241 times, and 32 times, that is 3273 and also 341, and 3241 added, which makes 96.

As multiplication supplies the place of frequent additions, and division of frequent subtractions, they are only repetitions and contractions of the simple rules, and when compared together, their tendency is exactly opposite. As numbers, increased by addition, are diminished and brought back to their original quantity by fubtraction; in like manner, numbers compounded by multiplication are reduced by division to the parts from which they were compounded. The multiplier shows how many additions are necessary to produce the number; and the quotient shows how many fubtractions are necessary to exhaust it. It follows, that the product, divided by the multiplieand, will quote the multiplier; and because either factor may be assumed for the multiplicand, therefore the product divided by either factor, quotes the other. It follows, also, that the dividend is equal to the product of the divisor and quotient multiplied together; and hence these operations mutually prove each other.

To prove multiplication. Divide the product by either factor. If the operation be right, the quotient is the other factor, and there is no remainder.

To prove division. Multiply the divisor and quotient together; to the product add the remainder, if any; and, if the operation be right, it makes up the dividend. Otherwise divide the dividend (after subtracting the remainder, if any) by the quotient. If the operation be right, it will quote the divisor. The reason of all these rules may be collected from the last paragraph.

Compound.

12

Compound Division.

RULE I. "When the dividend only confifts of different denominations, divide the higher denomination, and reduce the remainder to the next lower, taking in (p. 296. Rule V.) the given number of that denomination, and continue the division."

It is best not to reduce the terms lower than is necessary to render them equal. For instance, if each of them consists of an even number of sixpences, fourpences, or the like, we reduce them to sixpences, or fourpences, but not to pence.

The use of division is to find either of the factors by whose multiplication a given number is produced, when the other factor is given; and therefore is of Dividition that have be given. If the former be given, it discovers what that number is which is contained so many times in another. If the latter be given, it discovers how many times one number is contained in another. Thus, it answers the questions of an opposite kind to those mentioned under Rule IV. p. 296. as, To find the quantity of a fingle parcel or share; to find the value, weight, or measure, of a single article; to find how much work is done, provisions consumed, interest incurred, or the like, in a single day, &c.

The last use of division is a kind of reduction exactly opposite to that described under Rule V. p. 296. The manner of conducting and arranging it, when there are several denominations in the question, will appear from the following examples.

1. To reduce 15783 pence 2. To reduce 174865 grs. to to pounds, sh. and pence. 1b. oz. and dwt. Troy.

12)15783(13 12··· 12)174865(168···		364(30 36.
	15	68 48	128 120	04

63 60		145 144	6	
disposition-re-		Pro		

Auswer, 651. 158. 38. Aus. 30lb. 40z. 6dwt. 1gr.

In the first example, we reduce 15783 pence to shillings, by dividing by 12, and obtain 1315 shillings, and a remainder of 3 pence. Then we reduce 1315 shillings to pounds, by dividing by 20, and obtain 65 pounds and a remainder of 15 shillings. The divisions might have been contracted.

In the practice of arithmetic, questions often occur which require both multiplication and division to refolve. This happens in reduction, when the higher denomination does not contain an exact number of the lower.

Rule for mixed reduction. "Reduce the given deno"mination by multiplication to fome lower one, which
"is an aliquot part of both; then reduce that by di"vision to the denomination required."

Ex. Reduce 31742l. to guineas.

Ex. Keduce 317421.	to guineas.
31742	Here we multiply by
20	20, which reduces the
-	pounds to shillings; and
21)634840(30239	divide the product by 21,
63	which reduces the shillings
	to guineas.
048	
42	,
-	

Answer, 30230 guineas and 10 shill.

M

T

PULL PULL

As Portuguese moncy frequently passes here in payments, we shall give a table of the pieces, and their value. A moidore =L.1 7 -

A half moidore - 13 = - 6 A quarter moidore = A double Joannes 3 12 = = 1 16 A Joannes A half ditto = - 18 A quarter ditto = **=** -An eighth ditto

Note 1. Guineas may be reduced to pounds, by adding one twentieth part of the number.

- Pounds may be reduced to merks by adding one nalf.
- 3. Merks may be reduced to pounds by subtracting one-third.
- 4. Four moidores are equal to three Joannes: wherefore moidores may be reduced to Joannes, by fubtracting one-fourth; and Joannes to moidores, by adding one-third.

5. Five Joannes are equal to 91. Hence it is eafy

to reduce Portuguese money to sterling.

Another case, which requires both multiplication and division, is, when the value, weight, measure, or duration of any quantity is given, and the value &c. of a different quantity required, we first find the value, &c. of a single article by division, and then the value, &c. of the quantity required, by multiplication.

Ex. If 3 yards cost 158. 9d. what will 7 yards cost, at the same rate?

s. d.
3) 15 9 Price of 3 yards.
5 3 Price of 1 yard, by Rule IV. p. 296.
7

L. r 16 9 Price of 7 yards (by par. ult. p. 299. col. 1.)

Many other inflances might be adduced, where the operation, and the reason of it are equally obvious. These are generally, though unnecessarily, referred to the rule of Proportion.

We shall now offer a general observation on all the operations in arithmetic. When a computation requires feveral fleps, we obtain a just answer, whatever order we follow. Some arrangements may be preferable to others in point of ease, but all of them lead to the fame conclusion. In addition, or fubtraction, we may take the articles in any order, as is evident from the idea of number; or, we may collect them into feveral fums, and add or fubtract thefe, either feparately or together. When both the simple operations are required to be repeated, we may either complete one of them first, or may introduce them promiscuously, and the compound operations admit of the same variety. When several numbers are to be multiplied together, we may take the factors in any order, or we may arrange them into several classes, find the product of each class, and then multiply the products together. When a number is to be divided by several others, we may take the divisors in any order, or we may multiply them into each other, and divide by the product; or we may multiply them into feveral parcels, and divide by the products fuccessively. Lastly, When multiplication and division are both required, we may begin with either; and when both are repeatedly necessary, we may collect the multipliers into one product, and the divisors into Divisionone another; or, we collect them into parcers, or use them singly, and that in any order. Still we shall obtain the proper answer, if none of the terms be neglected.

When both multiplication and division are necessary to obtain the answer of a question, it is generally best to begin with the multiplication, as this order keeps the account as clear as possible from fraction. The example last given may be wrought accordingly as follows:

Some accountants prove the operations of arithmetic by a method which they call calling out the 9's, de-

pending on the following principles:

First, If several numbers be divided by any divisor: (the remainders being always added to the next number), the sum of the quotients, and the last remainder will be the same as those obtained when the sum of the numbers is divided by the same divisor. Thus, 19, 15, and 23, contain, together, as many 5's, as many 7's, &c. as their sum 57 does, and the remainders are the same; and, in this way, addition may be proven by division. It is from the correspondence of the remainders, that the proof, by casting out the 9's, is deduced.

Secondly, If any figure with cyphers ansexed, be divided by 9, the quotient confifts entirely of that figure; and the remainder is also the same. Thus, 40, divided by 9, quotes 4, remainder 4; and 400 divided by 9, quotes 44, remainder 4. The same holds with all the digits; and the reason will be easily understood; every digit, with a cypher annexed, contains exactly so many tens; it must therefore contain an equal number of 9's, besides a remainder of an equal number of units.

Thirdly, If any number be divided by 9, the remainder is equal to the fum of the figures of the number, or to the remainder obtained, when that fum is divided by 9. For inflance, 3765, divided by 9, leave a remainder of 3, and the fum of 3, 7, 6, and 5, is 21; which divided by 9, leaves a remainder of 3. The reason of this will appear from the following illustration:

3000 divided by 9 quotes 333; remainder 3
700 quotes 77; remainder 7
60 quotes 6; remainder 6
700 quotes 6; remainder 6
700 quotes 0; remainder 5
700 quotes 2; remainder 3

wherefore, 3765 divid. by 9 quotes 418; remainder 3; for the reason given. Hence we may collect the following rules for practice.

To cast the 9's out of any number, or to find what remainder will be left when any number is divided by 9: Add the figures; and when the sum exceeds 9, add the figures which would express it. Pass by the 9's; and, when the sum comes exactly to 9, neglect it, and begin anew. For example, if it be required to cast the 9's out of 3573294, we reckon thus: 3 and

13

Division. 5 is 8, and 7 is 15; 1 and 5 is 6, and 3 is 9, which we neglect; 2 and (passing by 9) 4 is 6; which is the remainder or RESULT. If the article out of which the 9's are to be cast contains more denominations than one, we cast the 9's out of the higher, and multiply the result by the value of the lower, and carry on the product (casting out the 9's, if necessary), to the lower.

To prove addition, cast the 9's out of the several articles, carrying the results to the following articles; cast them also out of the sum. If the operation be right, the results will agree.

To prove subtraction, cast the 9's out of the minuend; cast them also out of the subtrahend and remainder together; and if you obtain the same result, the operation is presumed right.

To prove multiplication, cast the 9's out of the multiplicand, and also out of the multiplier, if above 9. Multiply the results together, and cast the 9's, if necessary, out of their product. Then cast the 9's out of the product, and observe if this result correspond with the former.

The reason of this will be evident, if we consider multiplication under the view of repeated addition. In the first example it is obviously the same. In the second, we may suppose the multiplicand repeated 48 times. If this be done, and the 9's cast out, the result, at the end of the 9th line, will be 0; for any number, repeated 9 times, and divided by 9, leaves no remainder. The same must happen at the end of the 18th, 27th, 36th, and 45th lines; and the last result will be the same as if the multiplicand had only been repeated 3 times. This is the reason for casting out the 9's from the multiplier as well as the multiplicand.

To prove division, cast the 9's out of the divisor, and also out of the quotient; multiply the results, and cast the 9's out of the product. If there be any remainder, add to it the result, casting out the 9's, if necessary. If the account be right, the last result will agree with that obtained from the dividend.

And the refult of the dividend is 6

This depends on the fame reason as the last; for the dividend is equal to the product of the divisor and quotient added to the remainder.

METIC.

We cannot recommend this method, as it lies under Proportions the following disadvantages.

First, If an error of 9, or any of its multiples, the committed, the results will nevertheless agree; and so the error will remain undiscovered. And this will always be the case, when a figure is placed or reckoned in a wrong column; which is one of the most frequent causes of error.

Secondly, When it appears by the disagreement of the results, that an error has been committed, the particular figure or figures in which the error lies are not pointed out; and, consequently, it is not easily corrected.

CHAP. VI. RULE OF PROPORTION.

SECT. I. SIMPLE PROPORTION.

QUANTITIES are reckoned proportional to each other, when they are connected in such a manner, that if one of them be increased or diminished, the other increases or diminishes at the same time; and the degree of the alteration on each is a like part of its original measure; thus four numbers are in the same proportion, the first to the second, as the third to the fourth, when the first contains the second, or any part of it, as often as the third contains the fourth, or the like part of it. In either of these cases, the quotient of the first, divided by the second, is equal to that of the third divided by the fourth; and this quotient may be called the measure of the proportion.

Proportionals are marked down in the following

The rule of Proportion directs us, when three numbers are given, how to find a fourth, to which the third may have the same proportion that the first has to the second. It is sometimes called the Rule of Three, from the three numbers given; and sometimes the Galden Rule, from its various and extensive utility.

Rule. "Multiply the second and third terms to-"gether, and divide the product by the sirst."

Ex. To find a fourth proportional to 18, 27, and 34.

To explain the reason of this, we must observe, that if two or more numbers be multiplied or divided alike, the products or quotients will have the same proportion.

18: 27

Multiplied by 34, 612: 918
Divided by 18, 34: 51

The

TH

Proportion. The products 612, 918, and the quotients 34, 51, have therefore the same proportion to each other that 18 has to 27. In the course of this operation, the products of the first and third term are divided by the first; therefore the quotient is equal to the third.

R

The fiest and second terms must always be of the fame kind; that is, either both monies, weights, meafures, both abilitact numbers, or the like. The fourth, or number fought, is of the fame kind as the third.

When any of the terms is in more denominations than one, we may reduce them all to the lowest. But this is not always necessary. The first and second should not be reduced lower than directed p. 299, col. 1. par. penult.; and, when either the fecond or third is a fimple number, the other, though in different denominations, may be multiplied without re-

The accountant must consider the nature of every question, and observe the circumstance which the proportion depends on; and common fense will direct him to this if the terms of the question be understood. It is evident that the value, weight, and measure of any commodity is proportioned to its quantity; that the amount of work or confumption is proportioned to the time; that gain, lofs, or interest, when the rate and time are fixed, is proportioned to the capital fum from which it arises; and that the effect produced by any cause is proportioned to the extent of the cause. In these, and many other cases, the proportion is direct, and the number fought increases or diminishes along with the term from which it is derived.

In fome questions, the number fought becomes less, when the circumstances from which it is derived become greater. Thus, when the price of goods increases, the quantity which may be bought for a given fum is smaller. When the number of men employed at work is increased, the time in which they may complete it becomes shorter; and, when the activity of any cause is increased, the quantity necessary to produce a given effect is diminished. In these, and the like, the proportion is faid to be inverse.

GENERAL RULE for stating all questions, whether direll or inverse. " Place that number for the third "term which fignifies the same kind of thing with " what is fought, and confider whether the number " fought will be greater or lefs. If greater, place the " least of the other terms for the first; but, if less, " place the greatest for the first."

Ex. 1st. If 30 horses plough 12 acres, how many will 42 plough in the same time?

н. н. а. 30 : 42 :: 12

Here, because the thing sought is a number of acres, we place 12, the given number of acres, for the third term; and, because 42 horses will plough more than 12, we make the leffer number 30, the first term, and the greater number, 42, the fecond term.

Ex. 2d.] If 40 horses be maintained for a certain fum on hay, at 5d. per stone, how many will be maintained on the fame fum when the price of hay ri-Proportion fes to 8d.

> d: d. H. 8:5::40

Here, because a number of horses is sought, we make the given number of horses, 40, the third term; and, because fewer will be maintained for the fame money, when the price of hay is dearer, we make the greater price, 8d. the first term; and the leffer price 5d. the second term.

The first of these examples is direct, the second inverse. Every question consists of a supposition and demand. In the first, the supposition is, that 30 horses plough 12 acres, and the demand, how many 42 will plough? and the first term of the proportion, 30, is found in the supposition, in this, and every other direct question. In the second, the supposition is, that 40 horfes are maintained on hay at 5d. and the demand, how many will be maintained on hay at 8d.? and the first term of the proportion, 8, is found in the demand, in this and every other inverse question.

When an account is stated, if the first and second term, or first and third, be measured by the same number, we may divide them by that meafure, and use the quotients in their stead.

Ex. If 36 yards cost 42 shillings, what will 27 cost? Y. Y. sh. Here 36 and 27 are both 36 : 27 :: 42 4: 3::42 measured by 9, and we work with the quotients 4 and 3.

SECT. II. COMPOUND PROPORTION.

Sometimes the proportion depends upon several circumitances. Thus, it may be afked, if 18 men confume 6 bolls corn in 28 days, how much will 24 men consume in 56 days? Here the quantity required depends partly on the number of men, partly on the time, and the question may be resolved into the two following ones:

1st, If 18 men confume 6 bolls in a certain time, how many will 24 men confume in the fame time? M. M. B. B. 18: 24:: 6:8 Answer. 24 men will consume

8 bolls in the same time.

18)144(8
2d, If a certain number of men confume 8 bolls in 28 days, how many will they confume in 56 days? D. D. B. B.

28:56::8:16 Anf. The same number of men will consume 16 bolls in 56 days.

28)448(16

In the course of this operation, the original number of bolls, 6, is first multiplied into 24, then divided by 18, then multiplied into 8, then divided by 28. It would answer the same purpose to collect the multipliers into one product, and the divisors into another; and then to multiply the given number of bolls by the former, and divide the product by the latter, p. 300. col. 1. par. ult.

The above question may therefore be stated and wrought as follows:

Men

15

oportion. Men 18:24::6 bolls

Days 28:56

Here we multiply 18 into 28 for a divisor, and 6 into the product of 24 by 56, for a dividend.

more miles will re-

"In general, state the several particulars on which the question depends, as so many simple proportions, attending to the sense of the question to discover whether the proportions should be stated directly or inversely; then multiply all the terms in the first rank together, and all those in the second rank together; and work with the products as directed in the simple rule (Sect. 1. p. 301.)"

Example. If 100 men make 3 miles of road in 27 days, in how many days will 150 men make 5 miles?

Men 150: 100:: 27 days

Miles 3 5

450 500

450 27

Example. If 100 men make 3 miles of road in 27 miles?

Here the first stating is inverse, because more men will do it in fewerdays; but the second is direct, because

450)13500(30 days, anf. quire more days. The following contraction is often useful. After stating the proportion, if the same number occurs in both ranks, dash it out from both; or, if any term in the first rank, and another in the second rank are measurethy the same numbers, dash out the original terms, and use the quotients in their stead.

 $E_{\rm K}$. If 18 men confume 30l, value of corn in 9 months, when the price is 16s, per boll, how many will confume 54l, value in 6 months, when the price is 12s, per boll? In this question, the proportion depends upon three particulars, the value of corn, the time and the price. The first of which is direct, because the more the value of provisions is, the more time is required to consume them; but the second and third are inverse, for the greater the time and price is, sewer

men will consume an equal value.

Here we observe that 6 in the first rank measures 54 in the second: so we dash them out, and place the quotient 9 in the second rank. Next, because 30 and 9 are both measured by 3, we dash them out, and place down the quotients 10 and 3; then, because 12 and 16 are both measured by 4, we dash them out, and place down the quotients 3 and 4. Lastly, Because there is now 3 in both columns, we dash them out, and work with

10)648(64% we dash them out, and work with the remaining terms, according to the rule.

The monies, weights and measures, of different countries, may be reduced from the proportion which they bear to each other.

Ex. If 112 lb. avoirdupois make 104 lb. of Holland, and 100 lb. of Holland make 89 of Geneva, and 110

of Geneva make 117 of Seville, how many lbs. of Se-Proportion ville will make 100 lb. avoirdupois.

112:104::100 100: 89 110:117

If it be required, how many lb. avoirdupois will make 100 of Seville, the terms would have been placed in the different columns thus:

104: 112:: 100 89: 100 117: 110

SECT. III. DISTRIBUTIVE PROPORTION.

If it be required to divide a number into parts, which have the same proportion to each other, that several other given numbers have, we add these numbers together, and state the following proportion: As the sum is to the particular numbers, so is the number required to be divided to the several parts sought.

Ex. 1st.] Four partners engage to trade in company; A'sstock is L.150, B's I.320, C's L.350, D's L.500; and they gain L.730: Required how much belongs to each, if the gain be divided among them in proportion to their stocks?

Rem.

A's flock L.150 1320: 150:: 730: L. 82 19 1 - 120

B's 320 1320: 320: . 730: 176 19 4 - 960

C's 350 1320: 350: 730: 193 11 2 - 720

D's 500 1320: 500: . 730: 276 10 3 - 840

Wholestock 1320 Proof L.730

This account is proved by adding the gains of the partners; the fum of which will be equal to the whole gain, if the operation be right; but, if there be remainders, they must be added, their fum divided by the common divisor, and the quotient carried to the lowest place.

Ex. 2d.] A bankrupt owes A L.146, B L.170, C L.45, D L.480, and E L.72; his whole effects are only L.342: 7:6. How much should each have? A's debt L.146 913: 146:: L.342 7 6: L.54 15 A's share: B's 170 913: 170:: 342 7 6 63 15 B's C'a 45 913: 45:: 342 7 6 16 17 6C's D's 480 913: 480:: 342 7 6 180 D's

45 913: 45:: 342 7 6 16 17 6C's

10 48c 913: 480:: 342 7 6 180 D's

72 913: 72:: 342 7 6 27 E's

L913 1... 342 7 6

This might also be calculated, by sinding what composition the bankrupt was able to pay per pound; which is obtained by dividing the amount of his effects by the amount of his debts; and comes to 7s. 6d. and then finding by the rules of practice, how much each debt came to at that rate.

CHAP. VII. RULES FOR PRACTICE.

The operations explained in the foregoing chapters comprehend the whole fystem of arithmetic, and are sufficient for every computation. In many cases, however, the work may be contracted, by adverting to the particular circumstances of the question. We shall explain, in this chapter, the most useful methods which practice has suggested for rendering mercantile computations easy; in which, the four elementary rules of arithmetic are sometimes jointly, sometimes separately employed.

SECT. I. COMPUTATION OF PRICES.

The value of any number of articles, at a pound, a

Practice. shilling, or a penny, is an equal number of pounds, shillings, or pence; and these two last are easily reduced to pounds. The value, at any other rate, may be calculated by eafy methods, depending on some contraction already explained, or on one or more of the following principles.

ift, If the rate be an aliquot part of a pound, a shilling, or a penny, then an exact number of articles may be bought for a pound, a shilling, or a penny; and the value is found by dividing the given number accordingly. Thus, to find the price of so many yards at 26. 6d. which is the eighth part of a pound, we divide the quantity by eight, because every eight yards cost L.I.

2d, If the rate be equal to the sum of two other rates which are easily calculated, the value may be found by computing these separately, and adding the fums obtained. Thus, the price of so many yards, at 9d. is found, by adding their prices, at 6d. and 3d. together.

3d, If the rate be equal to the difference of two eafy rates, they may be calculated separately, and the leffer fubtracted from the greater. Thus, the value of fo many articles at 11d. is found, by subtracting their value at a penny from their value at a shilling. We may suppose that a shilling was paid for each article, and then a penny returned on each.

4th, If the rate be a composite number, the value may be found by calculating what it comes to at one of the component parts, and multiplying the same by the other.

CASE I. "When the rate is an aliquot part of a " pound, divide the quantity by the number which " may be bought for a pound."

Table of the aliquot parts of L.1.

En. 1st.] What is the value 2d. What is the value
                                 of 1773 yards, at 3d.?
  of 7463 yards, at 4s.?
                                       80)17713
        5)7463
                                          L. 22 3 3
        L.1492 126.
```

In the first example we divide by 5 because 48. is of a pound; the quotient 1492 shows how many pounds they amount to; besides which there remain three yards at 4s. and these come to 12s. In the second example, we divide by 80, as directed, and the quotient gives L. 22, and the remainder 13 yards, which at 3d. comes to 3s. and 3d.

This method can only be used in calculating for the particular prices specified in the table. The following 6 cases comprehend all possible rates, and will therefore exhibit different methods of folving the foregoing questions.

CASE II. "When the rate confifts of shillings only, a multiply the quantity by the number of shillings, " and divide the product by 20: Or, if the number " of shillings be even, multiply by half the number, "and divide the product by 10."

Ex. 1ft.] 4573 at 139. 2d.] 7543 at 148. 13 10)52801 13719 L. 5280 28. 4573

20)59449 L. 2972 98.

The learner will eafily perceive, that the method in which the fecond example is wrought, must give the same answer as if the quantity had been multiplied by 14, and divided by 20; and, as the division by 10 doubles the last figure for shillings, and continues all the rest unchanged for pounds, we may obtain the anfwer at once, by doubling the right hand figure of the product before we let it down.

If the rate be the fum of two or more aliquot parts of a pound, we may calculate these as directed in Case I. and add them. If it be any odd number of shillings, we may calculate for the even number next lower, and add thereto the value at a shilling. If it be 198. we may subtract the value at a shilling, from the value at a pound.

Case III. "When the rate confifts of pence only." Method r. If the rate be an aliquot part of a shilling, divide the quantity accordingly, which gives the answer in shillings; if not, it may be divided into two or more aliquot parts; calculate these separately, and add the values; reduce the answer to pounds.

I penny is 12 of a shilling, of ditto. 2d. 3d. of ditto. 4d. 6d. 5d. is the fum of 4d. and 1d. or of 2d. and 3d. 7d. is the fum of 4d. and 3d. or of 6d. and 1d. 8d. is the fum of 6d. and 2d. or the double of 4d. od. is the fum of 6di and 3d. 10d. is the fum of 6d. and 4d. 11d. is the fum of 6d. 3d. and 2d.

Here, because 4d. is one En. 1st.] 7423 at 4d. third of a shilling, we divide by 3, which gives the 3)7423 price in faills, and reduce 20)2474 L.123 14 thefeby divisions to pounds. 2d.] 9786at 9d. Here we suppose, that

first 6d. and then gd. is At 6d. = fof 18. 4893 paid for each article; half At 3d.=+of 6d. 2446 the quantity is the number of shillings which they would cost at 6d. each. At 9d. L.366 196 Half of that is the cost at 3d.] 4856at 11d. 3d. and these added and reduced give the answer.

At 6d.= 1 of 18. 2428 Here we calculate what the articles would cost at At 3d:= - of 6d:1214 6d. at 3d. and at 2d. and At2d.= fof6d. 809 add the values.

ııd. 4451 4 L.222 11 4

It is fometimes easier to calculate at two rates, whose difference is the rate required, and subtract the lesser value from the greater. Thus, the last example may be wrought by fubtracting the value at a penny from the value at a shilling. The remainder must be the

value

hap. VIL.

ARTTHMETIC

Practice. value at 11d.

4856s. At Ta. At Id.= 404 At 11d. 4451

10d. may be wrought as the difference of 18. and 2d.; and feveral other rates in like manner.

L. 222 11 Meth. 2. Multiply the quantity by the number of pence, the product is the answer in pence. Reduce it to pounds. Meth. 3. Find the value at a penny by division, and

multiply the same by the number of pence.

CASE IV. " When the rate confifts of farthings on-" ly, find the value in pence, and reduce it by divi-" fion to pounds."

Ex. 1st. 37843 at 1 farthing. 2d. 23754 at id. 4)37843 farth. 2)23754 halfpence 12)11877 pence 12) 9460 pence 788 41 989 9 L. 49 L. 39 8 41 9 Or, 72564 3d. 72564 at id. 3 At 4d. 3682 4)217692 farth. At id. 18141 1) 54423 pence 12)54423 d. 4535 3 L. 226 15 3 226 15

We may also find the amount in twopences, threepences, fourpences, or fixpences, by one divition, and reduce these as directed in Case I.

CASE V. " When the rate confids of pence and " farthings, find the value of the pence, as directed " in Case III. and that of the farthings from the pro-" portion which they bear to the pounds. Add thefe " together, and reduce."

Ex. 1ft.] 3287 at 53d.

L.1245 10 11

Method 2. Reduce the pounds to shillings, and procecd as in Cafe V1.

The learner should at first try every calculation more ways than one; which will not only ferve the purpose of proving the operation, but will render him expert at discovering the hell method for folving each question, and will lead him to invent other methods; for we have not exhausted the subject.

Thus, if the number of articles be 20, each shilling of the rate makes a pound of the amount. If it be 12, each penny of the rate makes a shilling of the amount. If 240, each penny of the rate makes a pound of the amount. If 480, each balfpenny makes a pound. If 960, each farthing makes a pound. If the number of articles be a multiple, or an aliquot part of any of these, the amount is easily calculated. And if it be near to any fuch number, we may calculate for that number, and add or fubtract for the difference.

We have hitherto explained the various methods of computation, when the quantity is a whole number, and in one denomination. It remains to give the proper directions when the quantity contains a fraction, or is expressed in several denominations.

When the quantity contains a fraction, work for the integers by the preceding rules, and for the fraction take proportional paris.

When the quantity is expressed in several denominations, and the rate given for the bigber; calculate the higher, confider the lower ones as fractions, and work by the last rule.

When the rate is given for the lower denomination, reduce the higher denomination to the lower, and calculate accordingly.

Note 1st, 7 lb. 14 lb. and 21 lb. are aliquot parts Practice. of 1 gr.: and 16 lb. is 7 of 1 cwt.; and are therefore cafily calculated.

2d, If the price of a dozen be so many shillings, that of an article is as many pence; and if the price of a grofs be fo many shillings, that of a dozen is as many pence.

3d, If the price of a ton or feore be fo many pounds, that of I cwt. or a fingle article, is as many shillings. 4th, Though a fraction less than a farthing is of

no consequence, and may be rejected, the learner must be careful lest he lose more than a farthing, by rejecting feveral remainders in the same calculation.

SECT. II. DEDUCTIONS on WEIGHTS, &c.

The full weight of any merchandife, together with that of the cask, box, or other package, in which it is contained, is called the gross weight. From this we must make proper deductions, in order to discover the quantity, for which price or duty should be charged, which is called the nett weight.

Tare is the allowance for the weight of the package; and this should be ascertained by weighing it before the goods are packed. Sometimes, however, particularly in payment of duty, it is cultomary to allow fo much per C. or fo much per 100 lb. in place of tare.

Tret is an allowance of 4 lb. on 104 granted on currants, and other goods on which there is waste, in order that the weight may answer when the goods are retailed.

Cloff, or Draught, is a further allowance granted on some goods in London, of 2 lb. on every 3 C. to turn the scale in favour of the purchaser. The method of calculating these and the like will appear from

the following examples.

Ex. 1st, What is the nett weight of 17 C. 2 q. 14 lb.

tare 18 lb. per cwt. C. g. lb.

C. q. lb. 17 2 14 grofs. 16lb.≈ f C. 2 2 2lb.= f of 16lb. 1 18lb. 2 3 9 1 tare. 317 I 44 nett. 28 317 lb. C. q. lb.

4) 11 $9\frac{1}{4}(239\frac{1}{4})$ In the first method, we add the tare at 16lb. which is 4 of the gross weight, to the tare, at 2lb. which is 4 of the former. In the second, we multiply the gross weight by 18; the tare is 1lb. for each cwt. of the product, and is reduced by division to higher denomi-

Because tret is always 4 lb. in 104, or-4 1 lb. in 26, it is obtained by dividing 10 by 26. 28

286 286

3d.]

Praclice.

12

20

3d.] What is the cloff on 28C. 29.? С. 7. 28 2 2

> 3) 57 (19lb.

This allowance being 2lh. on every 3C. might be found by taking of the number of C's and multiplying it by 2. It is better to begin with multiplication, for the reason given, p. 300. col. 2. par. 1.

SECT. III. COMMISSION, &c.

It is frequently required to calculate allowances on fums of money, at the rate of so many per 1001. Of this kind is Commission, or the allowance due to a factor for buying or felling goods, or transacting any other business; PREMIUM of INSURANCE, or allowance given for engaging to repay one's loffes at fea, or otherwife; Exchange, or the allowance necessary to be added or subtracted for reducing the money of one place to that of another; PREMIUMS on STOCK, or the allowance given for any share of a public stock above the original value. All these and others of a like kind are calculated by the following

RULE. "Multiply the fum by the rate, and divide "the product by 100. If the rate contain a fraction,

" take proportional parts."

Ex. What is the commission on 728l. at 21 per cent.?

728 2 2 per cent. 182 1 00)20 02 12 4|80 4 Answ. L. 20 3 20

When the rate is given in guineas, which is common in cases of insurance, you may add a twentieth part to the fum before you calculate. Or you may calculate at an equal number of pounds, and add a twentieth part to the answer.

When the given sum is an exact number of 10 pounds, the calculation may be done without fetting down any figures. Every 101. at \(\frac{1}{2}\) per cent. is a shilling; and at other rates in proportion. Thus, 1701. at \(\frac{1}{2}\) per cent. is 178.; and, at 1 per cent. 88. 6d.

Sect. IV. Interest.

Interest is the allowance given for the use of money by the borrower to the lender. This is computed at so many pounds for each hundred lent for a year, and a like proportion for a greater or a less time. The highest rate is limited by our laws to 5 per cent, which is called the legal interest; and is due on all debts constituted by bond or bill, which are not paid at the proper term, and is always understood when no other rate is mentioned.

The interest of any sum for a year, at any rate is Interest. found by the method explained in the last section.

The interest of any number of pounds for a year, at 5 per cent. is one-twentieth part, or an equal number of thillings. Thus, the interest of 346751. for a year is 34675 Millings.

The interest for a day is obtained by dividing the interest for a year, by the number of days in a year. Thus, the interest of 346751. for a day is found by dividing 34675 shillings by 365, and comes to 95 shillings.

The interest for any number of days is obtained by multiplying the daily interest by the number of days. Thus the interest of 346751. for 17 days, is 17 times 95 shillings, or 1615 shillings; and this divided by 20, in order to reduce it, comes to 801. 15s.

It would have ferved the fame purpose, and been easier to multiply at first by 17, the number of days; and, instead of dividing separately by 365, and by 20, to divide at once by 7300, the product of 365 multiplied by 20; and this division may by facilitated by the table inserted p. 298. col. 1.

The following practical rules may be inferred from

the foregoing observations.

I. To calculate interest at 5 per cent. " Multiply the " principal by the number of days, and divide the pro-" duct by 7300."

II. To calculate interest at any other rate. " Find what " it comes to at 5 per cent. and take a proper propor-"tion of the same for the rate required."

Ex. 1st. Interest on 346751, for 17 days, at 5 per cent.

Ex. 2d. Interest on 3041. 3s. 4d. for 8 days, at 4 percent. L. 304 3 4

		8

_		0	

Int. at 5 per cent. L. — 6 8 Deduce † 4

Int. at 4 per cent. L. - 5 4

When partial payments are made, we proceed in the following manner: Let us suppose a bill of 170h was due 12th August, that 54h was paid on the 18th September, 56h on the 17th October, and the bakence on the 14th November; and let it be required to find how much interest is due.

Days.

Aug. 12. L. 170 37 1190
Sept. 18. pd. 54 510 6290

116 29 1044
Oct. 17. pd. 56 232 3364
60 28 1680
Nov. 14. pd. 60 7300)11334(L. 1 : 11 : \frac{1}{3}.

Here we subtract the several payments from the original sum in their order, placing the dates in the margin; and from this it appears that there is interest due on 1701. from 12th August to 18th September, or 1101. from 18th September to 17th October, and on 601. from 17th October to 14th November. We next compute the number of days in each of these periods, and mark it against the respective sum. Then we multiply each sum by the number of days; reserving a column, when necessary, for the products of the several sigures in the multiplier. Lastly, We add these products, and divide their sum by 7300.

Interest on current accounts is calculated nearly in the same manner. For example, let the interest due on the following account he required to 31st July, at 4 per cent?

Dr. Mr A. Baird, his account current with W. Neil, Cr.

Interest at 4 per cent. L. 2 16 7				lns	er e	ft at	4 Mer	rent		- 2	16	,	

Here the sums on either side of the account are introduced according to the order of their dates. Those on the Dr. side are added to the former balance, and those on the Cr. side subtracted. Before we calculate the days, we try if the last sum 91l. be equal to the balance of the account, which proves the additions and subtractions; and, before multiplying, we try if the sum of the column of days be equal to the number of days, from 15th January to 31st of July.

In the 5th and 6th-multiplications, we begin at the pence column, and take in the carriage. In the 7th, instead of multiplying the 6s. 8d. by 21, we add the third part 21 to the product, because 6s. 8d. is the third of a pound. This is done by marking down the second line 1287, instead of 1280. As the computation on the odd shillings and pence is troublesome, and makes a very small increase of the interest, some neglect them altogether; others add one to the pound, when the shillings exceed 10, and neglect them when below it.

2d. Required interest on the following account to 31st December, allowing 5 per cent. when the balance is due to J. T. and 4 per cent. when due to N. W. Dr. Mr. J. T. his account current with N. W. Cr.

Dr. Mr. J. T. his account current with N. W. Cr. Dec. 31. To balance L. 150 April 9. By cash L. 70 Mar. 12. To cash 120 May 12. By cash 300 June 17. To cash 155 June 3. By cash 240 Sept. 24. To cash 178

ARTTHM

Intereft.

21

In this account, the balance is sometimes due to the one party, sometimes to the other. At the beginning, there is a balance due to N. W.; and, on the 9th of April there is 2001, due him. On the 12th of May, J. T. pays him 3001, which discharges what he owed, and leaves a balance of 1001, due him. The balance continues in J. T.'s savour till the 24th of September, when N. W. pays 2421. These changes are distinguished by the marks Dr. and Cr. The products are extended in different columns, and divided separately.

When payments are made on conflituted debts, at confiderable diffrances of time, it is usual to calculate the interest to the date of each payment, and add it to the principal, and then subtract the payment from the amount.

Ex. A bond for 540l. was due the 18th Aug. 1772; and there was paid 19th March 1773 50l.; and 19th December 1773 25l.; and 23d September 1774 25l.; and 18th August 1775 11cl. Required the interest and balance due on the 11th November 1775?

CHAP. VIII. VULGAR FRACTIONS.

In order to understand the nature of vulgar fractions, we mink suppose unity for the number 1) divided into several equal parts. One or more of these parts is called a fraction, and is represented by placing one number in a small character above a line, and another under it: For example, two-fifth parts is written thus, $\frac{1}{1}$. The number under the line (5) shows how many parts unity is divided into, and is called the denominator. The number above the line (2) shows how many of these parts are represented, and is called the numerator.

It follows from the manner of representing fractions, that, when the numerator is increased, the value of the fraction becomes greater; but, when the denominator is increased, the value becomes less. Hence we may infer, that, if the numerator and denominator be both increased, or both diminished, in the same proportion, the value is not altered; and therefore, if we multiply

both by any number whatever, or divide them by any number which measures both, we shall obtain other fractions of equal value. Thus, every fraction may be expressed in a variety of forms, which have all the same signification.

A fraction annexed to an integer, or whole number, makes a mixed number. For example, five and two third-parts, or \$5\frac{1}{2}\$. A fraction whole numerator is greater than its denominator is called an improper fraction. For example, feventeen third-parts, or \$\frac{1}{2}\$. Fractions of this kind are greater than unity. Mixed numbers may be reprefented in the form of improper fractions, and improper fractions may be reduced to mixed numbers, and fometimes to integers. As fractions whether proper or improper may be reprefented in different forms, we must explain the method of reducing them from one form to another, before we consider the other operations.

PROBLEM I. "To reduce mixed numbers to improper fractions; Multiply the integer by the denominator of the fraction, and to the product add the numerator. The fum is the numerator of the improper fraction fought, and is placed above the given denominator.

17 numerator fought.

Because one is equal to two halves, or 3 third parts, or 4 quarters, and every integer is equal to twice as many halves, or four times as many quarters, and so on; therefore, every integer may be expressed in the form of an improper fraction, having any affigued denominator: The numerator is obtained by multiplying the meteger into the denominator. Hence the reason of the foregoing rule is evident. 5, reduced to an improper fraction, whose denominator is 3, makes $\frac{1}{2}$, and this added to $\frac{1}{2}$, amounts to $\frac{1}{2}$.

PROBLEM II. "To reduce improper fractions to "whole or mixed numbers: Divide the numerator by "the denominator."

$$E_{x}, \frac{1}{17} = 619$$

$$17)112(619 1. \frac{1218}{102} 5. \frac{165}{103}$$

$$2. \frac{177}{177} 6. \frac{736}{103}$$

$$3. \frac{7316}{224} 7. \frac{864}{8}$$

This problem is the converse of the former, and the reason may by illustrated in the same manner.

PROBLEM III. "To reduce fractions to lower terms, "Divide both numerator and denominator by any number which measures both, and place the quotients in the form of a fraction."

Example. $\frac{716}{116} = \frac{7}{7} = \frac{7}{4}$ Here we observe that 135 and 360 are both measured by 5, and the quotients form $\frac{7}{7}$, which is a fraction of the same value as $\frac{7}{16}$ in lower terms. Again, 27 and 72 are both measured by 9, and the quotients form $\frac{7}{4}$, which is still of equal value, and in lower terms.

It is generally sufficient, in practice, to divide by such measures as are found to answer on inspection, or by the rules given p. 396. col. 2. But, if it be required to reduce a fraction to the lowest possible terms, we must di-

Vulger vide the numerator and denominator by the greatest Frections number which measures both. What number this is may not be obvious, but will always be found by the following rule.

To find the greatest common measure of two numhers, divide the greater by the leffer, and the divifor by the remainder continually, till nothing remain; the last divisor is the greatest common measure.

Example. Required the greatest number which

measures 475 and 589? 475)589(1

Here we divide 589 by 475, and the remainder is 114; then we divide 475 by 114, and the remainder is 19; then we divide 114 by 19, and there is no remainder: from which we infer, that 19, the last divisor, is the greatest common mea-

To explain the reason of this, we must observe, that any number which measures two others, will also meafure their ium, and their difference, and will measure any multiple of either. In the foregoing example, any number which measures 589, and 475, will measure their difference 114, and will measure 456, which is a multiple of 114; and any number which measures 475, and 456, will also measure their difference 19. Conlequently, no number greater than 19 can measure 589 and 475. Again, 19 will measure them both, for it measures 114, and therefore measures 456, which is a multiple of 114, and 475, which is just 19 more than 456; and, because it measures 475 and 114, it will measure their sum 589. To reduce 475 to the lowest possible terms, we divide both by numbers 19, and it comes to 1.

If there be no common measure greater than 1, the fraction is already in the lowest terms.

If the greatest common measure of 3 numbers be required, we find the greatest measure of the two first, and then the greatest measure of that number, and the third. If there be more numbers, we proceed in the iame manner.

PROBLEM IV. " To reduce fractions to others of " equal value that have the same denominator: 1st, " Multiply the numerator of each fraction by all the " denominators except its own. The products are " numerators to the respective fractions sought." " 2d, Multiply all the denominators into each other; " the product is the common denominator."

En. 4 and 3 and 1=188 and 160 and 186.

4 × 9 × 8 = 288 first numerator. $7 \times 5 \times 8 = 280$ fecond numerator.

 $3 \times 5 \times 9 = 135$ third numerator.

5 × 9 × 8 = 360 common denominator.

Here we multiply 4, the numerator of the first fraction, by 9 and 3 the denominators of the two others; and the product 288 is the numerator of the fraction fought, equivalent to the first. The other numerators are found in like manner, and the common denominator 360, is obtained by multiplying the given denomimators 50.9, 8, into each other. In the course of the whole operation, the numerators and denominators of each fraction are multiplied by the fame number, and therefore their value is not altered.

The fractions thus obtained may be reduced to lower Vulgar terms, if the feveral numerators and denominators have Fractions a common measure greater than unity. Or, after arranging the number for multiplication, as is done above, if the same number occur in each rank, we may dash them out and neglect them; and, if numbers which have a common measure occur in each, we may dash them out and use the quotients in their stead; or any number which is a multiple of all the given denominators, may be used as a common denominator. Sometimes a number of this kind will occur on infpection, and the new numerators are found by multiplying the given ones by the common denominator, and dividing the products by the respective given denomi-

If the articles given for any operation be mixed numbers, they are reduced to improper fractions by Problem I. If the answer obtained be an improper fraction, it is reduced to a mixed number by Problem II. And, it is convenient to reduce fractions to lower terms, when it can be done, by Problem III. which makes their value better apprehended, and facilitates any following operation. The reduction of fractions to the same denominator by Problem IV. is necessary to prepare them for addition or fubtraction, but not for multiplication or division.

1. ADDITION of VULGAR FRACTIONS.

RULE. " Reduce them, if necessary, to a common "denominator; add the numerators, and place the " fum above the denominator."

Ex. 1ft.] $\frac{1}{1} + \frac{3}{5} = \frac{47}{57} + \frac{17}{5}$ by Problem IV.= $\frac{17}{57}$ 2d.] $\frac{4}{7} + \frac{1}{5} + \frac{27}{5} = \frac{475}{575} + \frac{455}{575} = \frac{477}{575} + \frac{455}{575}$ by Problem II.= $\frac{3}{2} + \frac{1}{5} + \frac{4}{5} + \frac{4}{5}$

The numerators of fractions that have the same denominator fignify like parts; and the reason for adding them is equally obvious, as that for adding shillings or any other inferior denomination.

Mixed numbers may be added, by annexing the fum of the fractions to the fum of the integers. If the former be a mixed number, its integer is added to the other integers.

2. Subtraction of Vulgar Fractions.

RULE. " Reduce the fractions to a common deno-" minator; fubtract the numerator of the fubtrahend " from the numerator of the minuend, and place the " remainder above the denominator:"?

Ex. Subtract ? from 12 remainder #4.

$$\frac{1}{1} = \frac{1}{1}$$

$$= \frac{1}{1}$$
by Prob. IV. from 35 take 24

To subtract a fraction from an integer: subtract the numerator from the denominator, and place the remainder above the denominator; prefix to this the integer diminished by unity.

Ex. Subtract + from 12 remainder 117.

To subtract mixed numbers, proceed with the fractions by the foregoing rule, and with the integers in the common method. If the numerator of the fraction in the fubtrahend exceed that in the minuend, borrow the value of the denominator, and repay it by adding I to the unit place of the fubtrahend.

Vulgar

ractions.

Here, because 27 the numerator of the fraction in the minuend is less than 35, the numerator of the fubtraliend, we borrow 45 the denominator; 27 and 45 make 72, from which we fubtract 35, and obtain 37 for the numerator of the fraction in the remainder, and we repay what was borrowed, by adding 1 to 5 in the unit place of the fubtrahend.

The reason of the operations in adding or subtracting fractions will be fully understood, if we place the numerators of the fractions in a column like a lower denomination, and add or subtract them as integers. carrying or borrowing according to the value of the

higher denomination.

3. MULTIPLICATION of VULGAR FRACTIONS.

RULE. " Multiply the numerators of the factors " together for the numerator of the product, and the " denominators together for the denominator of the " product."

Ex. ift.] 1×4=19 ad.]87×71=1181×6576 87= 7 by Prob. I.
71= 4 by ditto. $2 \times 5 = 10$ num, 3×7=21 den. 42 × 31=1302 5 × 4= 20

To multiply 4 by 4 is the same, as to find what two third parts of 4 comes to; if one third part only had been required, it would have been obtained by multiplying the denominator 7 by 3, because the value of fractions is lessened when their denominators are increased; and this comes to $\frac{1}{2}$; and, because two thirds were required, we must double that fraction, which is done by multiplying the numerator by 2, and comes to 19. Hence we infer, that fractions of fractions, or compound fractions, such as 3 of 4 are reduced to simple ones by multiplication. The same method is followed when the compound fraction is expressed in three parts or more.

If a number be multiplied by any integer, its value is increased: If it be multiplied by 1, or taken one time, it undergoes no alteration. If it be multiplied by a proper fraction, or taken for one half, two thirds, or the like, its value is diminished, and the

product is less than the number multiplied.

The foregoing rule extends to every cafe, when there are fractions in either factor. For mixed numbers may be reduced to improper fractions, as is done in Ex. 2d.; and integers may be written, or understood to be written in the form of fractions whose numerator is 1. It will be convenient, however, to give fome further directions for proceeding, when one of the factors is an integer, or when one or both are mixed numbers.

1st, To multiply an integer by a fraction, multiply it by the numerator, and divide the product by the

denominator. E_x . $3756 \times \frac{1}{2} = 2253\frac{1}{2}$

5)11268(2253¹/₂ a mixed number, we multiply it first by the integer, and then by the fraction, and add the products.

138×51=7931 138×5=690 138× 1 3

> 1037 793±

3d, To multiply a mixed number by a fraction, we may multiply the integer by the fraction, and the two fractions together, and add the products.

Ex.
$$15\frac{1}{7} \times \frac{1}{7} = 3\frac{7}{7}$$

 $15 \times \frac{1}{7} = 3\frac{1}{7} = 3\frac{7}{7}$
 $\frac{1}{7} \times \frac{1}{7} = \frac{7}{7}$

4th, When both factors are mixed numbers, we may multiply each part of the multiplicand first by the integer of the multiplier, and then by the fraction, and add the four products.

Ex.
$$8\frac{7}{1}$$
 by $7\frac{1}{4}$
 $8 \times 7 = 56$
 $8 \times \frac{1}{4} = \frac{14}{4} = 6$ by Prob. II.
 $\frac{7}{1} \times 7 = \frac{14}{7} = 2\frac{4}{7}$
 $\frac{1}{2} \times \frac{1}{4} = \frac{2\frac{16}{16}}{16}$

product 65 20 as before.

4. Division of Vulgar Fractions.

RULE I. " Multiply the numerator of the divi-" dend by the denominator of the divisor. The pro-" duct is the numerator of the quotient."

II. "Multiply the denominator of the dividend by "the numerator of the divifor. The product is the " denominator of the quotient."

Ex. Divide
$$\frac{7}{7}$$
 by $\frac{7}{7}$ Quotient $\frac{1}{7}$; $2 \times 9 = 18$ $5 \times 7 = 35$

To explain the reason of this operation, let us suppose it required to divide 4 by 7, or to take one seventh part of that fraction. This is obtained by multiplying the denominator by 7; for the value of fractions is diminished by increasing their denominators, and comes to 2. Again, Because 7 is nine times less than feven, the quotient of any number divided by & will be nine times greater than the quotient of the same number divided by 7. Therefore we multiply $\frac{2}{13}$ by 9, and obtain $\frac{1}{13}$.

If the divisor and dividend have the same denominator, it is fufficient to divide the numrators.

Ex. 17 divided by 37 quotes 4.

The quotient of any number divided by a proper fraction is greater than the dividend. It is obvious, that any integer contains more halves, more third parts, and the like, than it contains units; and, if an integer and fraction be divided alike, the quotients will have the same proportion to the numbers divided; but the value of an integer is increased when the divifor is a proper fraction; therefore, the value of a fraction in the like case is increased also.

The foregoing rule may be extended to every cafe, by reducing integers and mixed numbers to the form of improper fractions. We shall add some directions for shortening the operation when integers and mixed numbers are concerned.

1st, When the dividend is an integer, multiply it

Vulgar. Fractions Yulgar by the denominator of the divisor, and divide the Practions product by the numerator.

Ex. Divide 368 by 4

5)2576 (5157 quotient.

2d, When the divisor is an integer, and the dividend a fraction, multiply the denominator by the divisor, and place the product under the numerator.

Ex. Divide by 5 quotient $\frac{1}{10}$ 8 \times 5 = 40

3d, When the divisor is an integer, and the dividend a mixed number, divide the integer, and annex the fraction to the remainder; then reduce the mixed number, thus formed, to an improper fraction, and multiply its denominator by the divisor.

Ex. To divide $576\frac{4}{16}$ by 7 quotient $82\frac{4}{16}$ 7) 576 (82 Here we divide 576 by 7, the quotient is 82, and the remainder 2, to which we annex the fraction $\frac{4}{17}$; and reduce $2\frac{4}{17}$ to an improper fraction $\frac{1}{16}$, and multiply its denominator by 7, which $11 \times 7 = 77$ gives $\frac{1}{16}$.

Hitherto we have confidered the fractions as abstract numbers, and laid down the necessary rules accordingly. We now proceed to apply these to practice. Shillings and pence may be considered as fractions of pounds, and lower denominations of any kind as fractions of higher; and any operation, where different denominations occur, may be wrought by expressing the lower ones in the form of vulgar fractions, and proceeding by the foregoing rules. For this purpose the two following problems are necessary.

PROBLEM V. "To reduce lower denominations to fractions of higher, place the given number for the numerator, and the value of the higher for the demoninator."

Examples.

1. Reduce 7d. to the fraction of a failling. Anf. 7.
2. Reduce 7d. to a fraction of a pound. Anf. 7.
3. Reduce 153 7d to a fraction of a pound. Anf. 7.

3. Reduce 15.8.7d. to a fraction of a pound. Anf. 140 PROBLEM VI. "To value fractions of higher denominations, multiply the numerator by the value of the given denomination, and divide the product by the denominator; if there be a remainder, multiply it by the value of the next denomination, and continue the division."

Ex. Ift.] Required the value of \$\frac{1}{5}\$ of I.

17
20
60)340(5 8 9)32(3 15\$;

300
27

40
12
28

60)480
9)140
9
50
45

In the first example, we multiply the numerator 17 Decimal by 20, the number of shillings in a pound, and divide the product 340 by 60, the denominator of the fraction, and obtain a quotient of 5 shillings; then we multiply the remainder 40 by 12, the number of pence in a shilling, which produces 480, which divided by 60 quotes 8d. without a remainder. In the second example we proceed in the same manner; but as there is a remainder, the quotient is completed by a fraction.

Sometimes the value of the fraction does not amount to an unit of the lowest denomination; but it may be reduced to a fraction of that or any other denomination, by multiplying the numerator according to the value of the places. Thus $\frac{1}{1289}$ of a pound is equal to $\frac{13}{1289}$ of a shilling, or $\frac{140}{1289}$ of a penny, $\frac{950}{1289}$ of a farthing.

CHAP. IX. DECIMAL FRACTIONS.

SECT. I. NOTATION and REDUCTION.

The arithmetic of vulgar fractions is tedious, and even intricate to beginners. The difficulty arises chiefly from the variety of denominators; for when numbers are divided into different kieds of parts, they cannot be easily compared. This confideration gave rife to the invention of decimal fractions, where the units are divided into like parts, and the divisions and subdivisions are regulated by the same scale which is used in the arithmetic of integers. The first figure of a decimal fraction signifies tenth parts, the next hundredth parts, the next thousandth parts, and so os; and the columns may be titled accordingly. Decimals are diffinguished by a point, which separates them from integers, if any be prefixed.

The use of cyphers in decimals, as well as in integers, is to bring the fignificant figures to their proper places, on which their value depends. As cyphers, when placed on the left hand of an integer, have no fignification, but when placed on the right hand, increase the value ten times each; fo cyphers, when placed on the right hand of a decimal, have no fignification; but when placed on the left hand diminish the value ten times each.

The notation and numeration of decimals will be

obvious from the following examples.

4.7 fignifies Four, and leventh teath ports.

Four tenth parts, and feven hundredth parts, or 47 hundredth parts.

1047 Four hundredth parts, and feven thoufundth parts, or 47 thousandth

.407 Four tenth parts, and seven thousandth parts, or 407 thousandth parts.

4.07 Four, and feven hundredth parts.
4.007 Four, and feven thousandth parts.

The column next the decimal point is sometimes called decimal primes, the next decimal fecends; and

To reduce vulgar fractions to decimal ones: 44 Annex a cypher to the numerator, and divide it by the de-44 nominator, annexing a cypher continually to the re-44 mainder."

R H T

Decimal $Ex. 1 ft.] \frac{11}{7} = .16$ 3d.] ;=.666. 2d. $\frac{1}{6x} = .078125$ Fractions. 75)120(16 3)20(666 64)500(078125 448 18 75 450 20 520 450 512 18 80 O 20 64 18 160 20 128 320 320

18	243 [,]	176
		,
20	* 70	*.40
		22
		180

The reason of this operation will be evident, if we consider that the numerator of a vulgar fraction is understood to be divided by the denominator; and this division is actually performed when it is reduced to a decimal.

In like manner, when there is a remainder left in division, we may extend the quotient to a decimal, in-Read of completing it by a vulgar fraction, as in the following example.

0 From the foregoing examples, we may distinguish the several kinds of decimals. Some vulgar fractions may be reduced exactly to decimals, as Ex. 1st and 2d, and are called terminate or finite decimals. Others cannot be exactly reduced, because the divition always leaves a remainder; but, by continuing the division, we will perceive how the decimal may be extended to any length whatever. These are called infinite decimals. If the same figure continually returns, as in Ex. 3d and 4th, they are called repeaters, If two or more figures return in their order, they are called circulates. If this regular succession go on from the beginning, they are called pure repeaters, or circulates, Vol. II. Part I.

as Ex. 3d and 5th. If otherwise, as Ex. 4th and Decimal 6th, they are mixed repeaters or circulates, and the Fraction figures prefixed to those in regular succession are called the finite part. Repeating figures are generally diffinguished by a dash, and circulates by a comma, or other mark, at the beginning and end of the circle; and the beginning of a repeater or circulate is pointed out in the division by an afterisk.

Lower denominations may be confidered as fractions of higher ones, and reduced to decimals accordingly. We may proceed by the following rule, which is the

same, in effect, as the former.

To reduce lower denominations to decimals of higher: " Annex a cypher to the lower denomination, and " divide it by the value of the higher. When there " are feveral denominations, begin at the lowest, and " reduce them in their order."

Ex. To reduce 5 cwt. 2 qr. 21 lb. to a decimal of a ton?

18)210(.75 196	4)2.75).6875 24	20)5.6874(.284375 40
140	35	168
140	32	160
Q	30 23	87 80
	20	75
	20	60
	*****	N
	O	150
		140
		Television and the
		100

	•	0

Here, in order to reduce 21 lb. to a decimal of 1 gr. we annex a cypher, and divide by 28, the value of 1 qr. This gives .75. Then we reduce 2.75 qrs. to a decimal of 1 cwt. by dividing by 4, the value of I cwt. and it comes to .6875. Lastly, 5.6875 cwt. is reduced to a decimal of a ton by dividing by 20, and comes to .284375.

To value a decimal fraction: "Multiply it by the " value of the denomination, and cut off as many de-" cimal places from the product as there are in the " multiplicand. The rest are integers of the lower denomination."

Example. What is the value of .425 of L. 1?

SECT. II. ARITHMETIC of TERMINATE DECIMALS.

The value of decimal places decreases like that of integers, ten of the lower place in either being equal to one of the next higher; and the same holds in passing from decimals to integers. Therefore, all the operations are performed in the same way with decimals,

whether placed by themselves or annexed to integers, as with pure integers. The only peculiarity lies in the arrangement and pointing of the decimals.

In addition and fubtrattion, " Arrange units under " units, tenth parts under tenth parts, and proceed

" as in integers."

32.035	from 13.348	and 12.248
116.374	take 92.993	10.6752
160.63 12.3645	4.0487	1.5728

321.4035 In multiplication, "Allow as many decimal places "in the product as there are in both factors. If the " product has not fo many places, supply them by " prefixing cyphers on the left hand."

Ea. 1st.] 1.37 2d.] 43.75 .1572 1.8 .12 .01864 1095 35000 17500 137 2.466 21.0000

The reason of this rule may be explained, by observing, that the value of the product depends on the value of the factors; and fince each decimal place in either factor diminishes its value ten times, it must equally diminish the value of the product.

To multiply decimals by 10, move the decimal point one place to the right; to multiply by 100, 1000, or the like, move it as many places to the right as there are cyphers in the multiplier.

In division, " Point the quotient so that there may "be an equal number of decimal places in the divi-" dend as in the divisor and quotient together."

Therefore, if there be the same of decimal places in the divisor and dividend, there will be as many in the quotient.

If there be more in the dividend, the quotient will have as many as the dividend has more than the di-
